Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

H, HD, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.3/0.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. To clean up a spill, cover with Up to 15% calcium hypochloride. Place in container; neutralize after 12 hours if necessary. Keep sparks, flames, and other sources of ignition away. Keep material out of water sources and sewers. Attempt to stop leak if it is without hazard. Use water spray to knock down vapors. Avoid breathing vapors and bodily contact with the material. Keep upwind. Wash away any material which may have contacted the body with copious amounts of soap and water. Downwind evacuation must be considered. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

If spills or leaks of THD (Thickened HD) occur, follow the same procedures as those for HD, but dissolve the THD in acetone prior to introducing any decontaminating solution. Containment of THD is generally not necessary. Spilled THD can be carefully scraped off the contaminated surface and placed in a fully removable head drum with a high density, polyethylene lining. The THD can then be decontaminated, after it has been dissolved in acetone, using the same procedures used for HD. Contaminated surfaces should be treated with acetone, then decontaminated using the same procedures as those used for HD. Handling the THD requires careful observation of the "stringers" (elastic, thread-like attachments) formed when the agents are transferred or dispensed. These stringers must be broken cleanly before moving the contaminating device or dispensing device to another location, or unwanted contamination of a working surface will result.

Recommended field procedures (H, HD): The mustard should be contained using vermiculite, diatomaceous earth, clay, or fine sand, and neutralized as soon as possible using copious amounts of 5.25% sodium hypochlorite solution. Scoop all material and place in an approved DOT container. Cover the contents of the drum with decontaminating solution as above. The exterior of the drum shall be decontaminated and then labeled per IAW, EPA, and DOT regulations. All leaking containers shall be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, and DOT regulations. Dispose of the material used to decontaminate exterior of drum in accordance with IAW, federal, state, and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 5.25% Sodium Hypochlorite solution is not available then the following decontaminates may be used instead and are listed in the order of preference: Calcium Hypochlorite Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)]; and Super Tropical Bleach Slurry (STB).

Warning: Pure, undiluted calcium hypochlorite (HTH) will burn on contact with liquid blister agent.

Recommended laboratory procedures: A minimum of 65 g of decontamination fluid per gram of HD is allowed to agitate for a minimum of 1 h. Agitation is not necessary following the first hour if a single phase is obtained. At the end of 24 hours, the resulting solution shall be adjusted to a pH between 10 and 11. Test for presence of active chlorine by use of acidic potassium iodide solution to give free iodine color. Place 3 mL of the decontaminate in a test tube. Add several crystals of potassium Iodine and swirl to dissolve. Add 3 mL of 50 wt.% sulfuric acid water and swirl. IMMEDIATE iodine color indicates the presence of active chlorine. If negative, add additional 5.25% sodium hypochlorite solution to the decontamination solution, wait two hours, then test again for active chlorine. Continue procedure until positive chlorine is given by solution. A 10 wt.% calcium hypochlorite (HTH) mixture may be substituted for sodium hypochlorite. Use 65 g of decon/g of HD and continue the test as described for sodium hypochlorite. Scoop up all material and place in approved DOT containers. Cover the contents of the drum with decontaminating solution as above. The exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, and DOT regulations. Dispose of the material used to decontaminate exterior of drum In accordance with IAW federal, state and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limits. *Note*: Surfaces contaminated with HD and then rinse decontaminated, may evolve sufficient mustard vapor to produce a physiological response.

Recommended field procedures (HT): HT should be contained using vermiculite, diatomaceous earth; clay, or fine sand, and neutralized as soon as possible using copious amounts of alcoholic caustic, carbonate, or Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)]. Caution must be exercised when using these decontaminates since acetylene will be given off. Household bleach can also be used if accompanied by stirring to allow contact. Scoop up all contaminated material and place in approved DOT containers. Cover the contents with additional decontaminant. All leaking containers will be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate the outside of the container and label according to DOT and EPA requirements. Dispose of according to waste procedures below. Dispose of decontaminate according to federal, state, and local laws. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

Warning: Never use dry High Test Hypochlorite (HTH) or Super Tropical Bleach (STB) since they will react violently with HT and may burst into flames.

Recommended laboratory procedures: A minimum of 65 g of decontamination fluid per gram of HD is allowed to agitate for a minimum of 1 h. Agitation is not necessary following the first hour if a single phase is obtained. At the end of 24 hours, the resulting solution will be adjusted to a pH between 10 and 11. Test for presence of active chlorine by use of acidic potassium iodide solution to give free iodine color. Place 3 mL of the decontaminate in a test tube. Add several crystals of potassium iodine and swirl to dissolve. Add 3 mL of 50 wt.% sulfuric acid: water, and swirl. Immediate iodine color shows the presence of active chlorine. If negative, add additional 5.25% sodium hypochlorite solution to the decontamination solution, wait two hours, then test again for active chlorine. Continue procedure until positive chlorine is given by solution. Scoop up all material and place in approved DOT containers. Cover the contents with additional decontaminate as above. The exterior of the container will be decontaminated and labeled according to EPA and DOT regulations. All leaking containers will be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label according to EPA and DOT regulations. Dispose of the material according to waste disposal methods provided below. Dispose of decontaminate according to federal, state and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limits.

A 10 wt.% calcium hypochlorite mixture may be substituted for sodium hypochlorite. Use 65 g decon/g HT and continue the test as described for sodium hypochlorite. *Note*: Surfaces contaminated with HT, then rinse-decontaminated, may evolve sufficient HT vapor to produce a physiological response. HT on laboratory glassware may be oxidized by vigorous reaction with concentrated nitric acid.

Waste disposal method: All neutralized material should be collected, contained and thermally decomposed in EPA approved incinerators that will filter or scrub toxic by-products from effluent air before discharge to the atmosphere. Any contaminated materials or protective clothing should be decontaminated using HTH or bleach, and analyzed to assure it is free of detectable contamination (3X) level. Contaminated clothes and personal belongings should be placed in a sealed double bag and placed inside properly labeled drums and held for shipment back to the DA issue point. *Note*: Several states define decontaminated surety material as a RCRA hazardous waste.

Fire Extinguishing: This chemical may burn but does not easily ignite. HD will hydrolyze, forming HCI and thiodiglycol. Thermal decomposition products may include hydrogen chloride and oxides of sulfur and chlorides. Extinguish with water, foam, dry chemical, or carbon dioxide. Protective clothing and SCBA are required in presence of mustard gas. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Principles and methods for destruction of chemical weapons: “Destruction of chemical weapons” means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each nation shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each nation shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention [Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction]. All decontaminated material should be collected, contained and chemically decontaminated or thermally decomposed in an EPA approved incinerator, which will filter or scrub toxic by-products from effluent air before discharge to the atmosphere. Any contaminated protective clothing should be decontaminated using calcium hypochlorite (HTH) or bleach and analyzed to assure it is free of detectable contamination (3X) level. Contaminated clothes and personal belongings should be placed in a sealed double bag and subsequently placed inside properly labeled drums and held for shipment back to the DA issue point. Decontamination of waste or excess material shall be accomplished in accordance with the procedures outlined above with the following exceptions: (a) HD on laboratory glassware may be oxidized by its vigorous reaction with concentrated nitric acid. (b) Open pit burning or burying of HD or items containing or contaminated with HD in any quantity is prohibited. *Note*: Several states define decontaminated surety material as a RCRA Hazardous Waste.

EC Number: 410-400-0

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for human.

California Proposition 65 Chemical[102]: Developmental/Reproductive toxin (male)

Hazard Alert: Poison, Suspected reprotoxic hazard, Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, N; risk phrases: R22; R36; R51/53; R63; safety phrases: S2; S12/35; S26; S36/37; S41; S46; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: White to pale yellow crystalline solid. Molecular weight = 288.78; specific gravity (H_2O:1) = 1.24; boiling point = 391°C; 465°C; freezing/melting point = 65°C; vapor pressure = 10^{-8} mmHg @ 25°C; vapor pressure = 1.57×10^{-6} mmHg @ 0°C; flash point = 235°C. Soluble in water; solubility = 142 mg/L @ 25°C.

Potential Exposure: Myclobutanil is a nitrile compound and a triazole fungicide. It is widely used to control powdery mildew, rust, sclerotina, spot blight, rot, black rot and similar fungi on a variety of food and nonfood crops. Nitriles can be derived from salts of cyanide, but are usually less toxic.

Incompatibilities: Decomposes on exposure to strong light. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. The triazoles are sensitive to heat, friction, and impact. Sensitivity varies with the type substitution to the triazole ring. Metal chelated and halogen substitution of the triazole ring make for a particularly heat sensitive material. Azido and nitro derivatives have been employed as high explosives. No matter the derivative these materials should be treated as explosives[88]. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Permissible Exposure Limits in Air:

NIOSH REL: *Nitriles*: 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

Permissible Concentration in Water: Because nitriles do not release cyanide ions, they are generally less toxic.

Determination in Water: Method: USGS-NWQL O-2002-01; Procedure: gas chromatography/mass spectrometry; Matrix: filtered natural-water; Detection Limit: 0.0011 μg/L. Octanol−water coefficient: Log $K_{ow} = \sim 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, inhalation, dermal and eye contact

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Can cause irreversible eye damage. Harmful when inhaled, swallowed, or absorbed through skin. Poisonous if swallowed. Contact may irritate skin and cause eye irritation and possible severe injury. Avoid inhalation. LD_{50} (oral, rat) = 1600 mg/kg; (dermal, rat) ≥ 2 g/kg.

Long-Term Exposure: Evidence of reproductive and developmental effects.

Points of Attack: Eyes, skin. May affect this chemical may damage the male reproductive glands.

Medical Surveillance: Comprehensive physical examination with emphasis on the genitourinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum FSH, and serum LH may be carried out if, in the opinion of a physician, they are indicated. production of effects on the reproductive system

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear positive pressure SCBA (SCBA). Wear chemical protective clothing that is specifically recommended by the manufacturer. DuPont Tychem Suit Fabrics is recommended by one government source[88]. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: Where the neat (undiluted) test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e., organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO_2 and a high efficiency particulate filter)[88] wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling:

Nitriles spill

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: See "Incompatibilities" section. Thermal decomposition products may include Hydrogen chloride and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Contact a licensed disposal facility about surplus and nonrecyclable solutions. Burn in a chemical incinerator equipped with an afterburner and scrubber. Extra care must be exercised as the material in an organic solvent is highly flammable. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Incineration or permanganate oxidation.

California Proposition 65 Chemical[102]: Developmental/ Reproductive toxin (3/30/1999)
Hazard Alert: Poison, Possible thyroid effects, Sensitization hazard (skin), Suspected reprotoxic hazard, Environmental hazard
47FR 47669 (10/27/82); 54 FR 50020 (12/04/89); (55 FR 7935 (03) 06/90) [Environmental Protection]
California Chemical List of Lists (February 1997)
EPA Hazardous Waste Number (RCRA No.): U114
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
United States DOT Regulated marine pollutant (49CFR172. 101, Appendix B)
Hazardous to aquatic life or environment, with possible long lasting effects[291,292].
Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, N; risk phrases: R22; R37; R43; R50/53; safety phrases: S2; S8; S24/26; S29/35; S41; S46; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: Colorless crystalline solid (when pure). Light amber crystalline solid or 22% wettable powder solution. Slight odor of sulfide. Molecular weight = 256.34; specific gravity (H_2O:1) = 1.14 @ 20°C; boiling point = (decomposes); freezing/melting point = decomposes before melting @ 196°C; vapor pressure = very low; negligible. Hazard identification (based on NFPA-704 M Rating System): Health hazards (blue): 2; flammability (red): 0; reactivity (yellow): 0. Molecular weight = 256.34; boiling point = decomposes; freezing/melting point = decomposes when heated, without melting; specific gravity: 1.14 @ 20°C (solid). Highly soluble in water; solubility = $>2 \times 10^5$ mg/L.
Potential Exposure: Nabam is a broad spectrum dithiocarbamate fungicide/bactericide/algaecide/herbicide/microbiocide used to prevent crop damage by fungi, to protect harvested products from deterioration, and as an industrial microbiocide. As a result of the United States Environmental Protection Agency review of nabam in 1989, all food uses were voluntarily canceled by the manufacturers except for one FDA-regulated food use on sugar mill grinding, crusher, and/or diffuser systems, e.g., processing water systems. All other uses of nabam are for the control of algae, slime-forming bacteria, and fungi in indoor nonfood environments, paper mills, water cooling systems, drilling mud and packer fluids, and secondary oil recovery water system. Registered in the United States only for nonfood application.
Incompatibilities: Combustible material. Dust may form explosive mixture in air, water, acid, oxidizing materials. Heat or contact with moisture or acids causes rapid decomposition and the generation of toxic and flammable hydrogen sulfide and carbon disulfide. Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides. Corrosive to iron, copper, brass, and zinc metals, especially in the presence of moisture. Heat alkalies (lime), moisture can cause decomposition. Decomposes on prolonged storage; by moisture, light, and heat. Degradation produces ethylene thiourea.
Determination in Water: EPA EMSLC Method 630. The Determination of Dithiocarbamate Pesticides in Municipal and Industrial Wastewater by UV−VIS Spectrophotometry. Octanol−water coefficient: Log K_{ow} = negative; dissociates in water −4.24 (est)[83]. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Poisoning can occur by inhalation, ingestion, and absorption through the skin.
Harmful Effects and Symptoms
Short-Term Exposure: Low levels of toxicity. Concentrated solutions are slightly corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Dermal contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00013-2

respiration, slow heartbeat. Severe exposure may result in death. Unlike carbamates the dithiocarbamates are not cholinesterase inhibitors, but some of them may react with recently ingested alcohol or alcohol-containing products including wine, medications, and cold remedies such as cough syrups. Exposure may cause skin sensitization. LD_{50} (oral, rat) = 395 mg/kg[86]; 1400 mg/kg[83].

Long-Term Exposure: Thyroid effects. Evidence of reproductive and developmental effects. May cause skin sensitization.

Points of Attack: Thyroid function (possible goiter). Respiratory system, central nervous system, cardiovascular system, skin, eyes. Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin).

Medical Surveillance: Comprehensive physical examination with emphasis on the genitourinary tract analysis to include sperm count, motility, and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum luteinizing hormone (LH) may be carried out if, in the opinion of a physician, they are indicated production of effects on the reproductive system. Medical observation is recommended for 24−48 hours following breathing overexposure, as pulmonary edema may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count (CBC) and chest X-ray following acute overexposure. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4−8 ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel*: Medical observation is recommended for 24−48 hours following breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral- and Clay-Based; Dirt/Earth[88]. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved, SCBA, that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated, and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, carbon, and sulfur. Decomposes in boiling hot water, releasing poisonous hydrogen sulfide, and flammable carbon disulfide. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft. for liquids and at least 25 m/75 ft. for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. A potential candidate for liquid injection incineration at a temperature range of 650−1600°C and a residence time 0.1−2 seconds. Also, a potential candidate for rotary kiln incineration at a temperature range of 820−1600°C and residence times of seconds for liquids and gases, and hours for solids[83].

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N; risk phrases: R21/22; R25; R33; R36/38; R50; R62; safety phrases: S2; S26; S29; S35; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Naled is a white crystalline solid (when pure) or light straw-colored liquid (above 26.7°C) with a slightly pungent insecticide odor. Molecular weight = 380.80; specific gravity (H_2O:1) = 1.96 @ 25°C; boiling point = (decomposes) 110°C; freezing/melting point = 26.7°C; vapor pressure = 2×10^{-4} mm @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 1. Insoluble in water; slowly hydrolyzed.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this insecticide, fungicide, bactericide, acaricide. Also used in cooling towers, veterinary medicine, pulp and paper mill systems; hospitals, swimming pools; and bathrooms.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine,

bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Hydrolyzed in presence of water. Degraded by sunlight. Decomposes when heated; on contact with acids, acid fumes; bases, producing fumes of hydrogen chloride, hydrogen bromide, phosphorous oxides. Reacts with acids, strong oxidizers in sunlight. Slowly reacts with water; hydrolysis is; corrosive to metals. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 milligram per cubic meter

OSHA PEL: 3 milligram per cubic meter TWA

NIOSH REL: 3 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.1 milligram per cubic meter inhalable fraction and vapor [skin, sensitizer]; not classifiable as a human carcinogen; BEIA issued as Acetylcholinesterase inhibiting pesticides

Protective Action Criteria (PAC) not available

DFG MAK: 1 milligram per cubic meter, measured as the, inhalable fraction TWA; Peak Limitation Category II(2); [skin] danger of skin sensitization; Pregnancy Risk Group C

Australia: TWA 3 milligram per cubic meter [skin], 1993; Austria: MAK 3 milligram per cubic meter, 1999; Belgium: TWA 3 milligram per cubic meter [skin], 1993; Finland: TWA 3 milligram per cubic meter; STEL 6 milligram per cubic meter, 1999; France: VME 3 milligram per cubic meter [skin], 1999; Norway: TWA 3 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 3 milligram per cubic meter, 2003; Thailand: TWA 3 milligram per cubic meter, 1993; United Kingdom: TWA 3 milligram per cubic meter; STEL 6 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for dibrom in ambient air[60] ranging from 30 μ/m^3 (North Dakota) to 50 μ/m^3 (Virginia) to 60 μ/m^3 (Connecticut) to 71 μ/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: Mexico[35] has set maximum permissible concentration values in coastal waters of 3.0 μg/L and 0.03 mg/L (30 μg/L) in estuaries.

Determination in Water: Fish Tox = 10.17349000 ppb (INTERMEDIATE)

Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the nervous system; causing convulsions, respiratory failure. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. High exposure can result in death. Highly toxic; a probable human lethal dose may be between 1 teaspoon and 1 ounce. Human Tox = 14.00000 ppb (INTERMEDIATE).

Long-Term Exposure: May cause skin allergy. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system; central nervous system; cardiovascular system, skin, eyes, blood cholinesterase.

Medical Surveillance: NIOSH lists the following tests: cholinesterase: blood plasma, red blood cells/count; cholinesterase: blood serum, red blood cells/count; cholinesterase: red blood cells/count. Before employment and at regular times after that, the above tests are recommended. Cholinesterase level tests for the enzyme poisoned by this chemical. If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation is recommended. *Note to physician:* 1−4 mg atropine; maintenance: 2-mg doses at intervals of 15−60 minutes.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *30 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *75 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *150 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece). *200 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. It must be stored to avoid contact with strong oxidizers, such as chlorine and chlorine dioxide, since violent reactions occur. Keep away from acids, acid fumes; sunlight, heat, and water.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft./m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is noncombustible. Use agents suitable for surrounding fire. Thermal decomposition products may include hydrogen chloride, hydrogen bromide, and oxides of phosphorus, nitrogen, and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This pesticide is more stable to hydrolysis than dichlorvos (50% hydrolysis at pH 9 @ 37.5°C in 301 minutes). It is unstable in alkaline conditions, in presence of iron; and is degraded by sunlight. About 10% hydrolysis per day is obtained in ambient water. Incineration is recommended for large amounts[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*CAS: 8002-05-9*); 1-Low hazard to water. (*CAS: 8030-30-6; 8032-32-4*)

Description: Naphthas derived from both petroleum and coal tar are included in this group. *Petroleum naphthas* are colorless liquids. Gasoline or kerosene-like odor. A mixture of paraffins (C_5−C_{13}) that may contain a small amount of aromatic hydrocarbons, and are termed "close-cut" fractions. "Medium-range" and "wide-range" fractions are made up of 40−80% aliphatic hydrocarbons; 25−50% naphthenic hydrocarbons; 0−10% benzene, and 0−20% other aromatic hydrocarbons. Molecular weight = (approx.) 98 [petroleum distillates (naphtha)]; specific gravity (H_2O:1) = 0.78−0.97 [petroleum distillates (naphtha)]; boiling point = 35−60°C; freezing/melting point = −73°C; vapor pressure = (approx.) 40 mmHg [petroleum distillates (naphtha)]; flash point = − 40 to −66°C [petroleum distillates (naphtha)]; autoignition temperature = 288°C. Explosive Limits: LEL = 1.1%; U-1EL = 5.9%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 4; reactivity 0. Insoluble in water.

Coal tar naphtha is a mixture of aromatic hydrocarbons, principally toluene, xylene, and cumene. Coal tar naphtha is a reddish-brown, mobile liquid with an aromatic odor. Shipped as a molten solid. Benzene is present in appreciable amounts in those coal tar naphthas with low boiling points. molecular weight = (approx.) 110; specific gravity (H_2O:1) = 0.89−0.97; boiling point = 160−220°C; vapor pressure = <5 mmHg @ 20°C; flash point = 38−43°C. Explosive Limits: LEL = 1.0%; UEL—unknown. Hazard identification (based on NFPA-704 M Rating System): (coal tar) Health 2; flammability 2; reactivity 0. Insoluble in water. *VM&P naphtha* is a clear to yellowish liquid. Pleasant, aromatic odor: molecular weight = 111.73; specific gravity (H_2O:1) = 0.64−0.66; boiling point = 100−177°C; vapor pressure = 2−20 mmHg @ 20°C; flash points = −2 to 29°C; autoignition temperature = 232°C. Explosive limits: vary somewhat but typical values are: LEL = 0.9%; UEL: 6.7%. Hazard identification (based on NFPA-704M Rating System): (VM&P) Health 1; flammability 3; reactivity 0. See also Stoddard Solvent. *Mineral spirits, 64475-85-0*: molecular weight = 97.26. *Naphtha (petroleum) light aliphatic; rubber solvent, 64742-89-8*: molecular weight = 97.26; specific gravity (H_2O:1) = 0.6.

Potential Exposure: Naphthas are used as organic solvents for dissolving or softening rubber, oils, greases, bituminous paints, varnishes, and plastics. The less flammable fractions are used in dry cleaning. The heavy naphthas are used as a vehicle for various pesticides. Coal tar naphthas are used as quick-drying paint solvent; in the manufacture of floor coverings; resin solution; varnish; VM&P naphtha is used as a solvent for lacquers and varnishes and as a rapid-dry paint thinner.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

NIOSH REL: 100 ppm/400 milligram per cubic meter TWA

Australia: TWA 480 milligram per cubic meter, 1993; Denmark: TWA 25 ppm (145 milligram per cubic meter), 1999; Hungary: TWA 300 milligram per cubic meter; STEL 800 milligram per cubic meter, 1993; the Phillipines: TWA 100 ppm (400 milligram per cubic meter), 1993; Poland: MAC (TWA) 300 milligram per cubic meter; MAC (STEL) 900 milligram per cubic meter, 1999; Russia: STEL 100 milligram per cubic meter, 1993; Switzerland: MAK-W 300 milligram per cubic meter (1100 milligram per cubic meter), 1999; Turkey: TWA 100 ppm (400 milligram per cubic meter), 1993

8032-32-4, VM&P naphtha, legroin, paint solvent

OSHA PEL: None

NIOSH REL: 350 milligram per cubic meter TWA; 1800 milligram per cubic meter [15-minutes] Ceiling Concentration

ACGIH withdrawn; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 28, no values found in Ver. 29[138]

PAC-1: 1100 ppm

PAC-2: 1800 ppm

PAC-3: 40,000 ppm

Poland: TWA 500 milligram per cubic meter; STEL 1500 milligram per cubic meter, 1999. In addition, several states have set guidelines or standards for naphtha in ambient air[60] ranging from zero (Nevada) to 60–27,000 μ/m^3 (Connecticut) to 225 μ/m^3 (Virginia).

PAC Ver. 28, no values found in Ver. 29[138]

64742-89-8 [naphtha (petroleum) light aliphatic; rubber solvent]

PAC-1: 1200 ppm

PAC-2: 6700 ppm

PAC-3: 40,000 ppm

Determination in Air: Use NIOSH Analytical Method (IV) #1550, Naphthas, OSHA Analytical Method 48.

Routes of Entry: Inhalation of vapor, ingestion; skin and/or eye contact. Percutaneous absorption of liquid is important in development of systemic effects if benzene is present.

Harmful Effects and Symptoms

Short-Term Exposure: The naphthas are irritating to the skin conjunctiva; and the mucous membranes of the upper respiratory tract. Skin "chapping" and photosensitivity may develop after repeated contact with the liquid. If confined against skin by clothing, the naphthas may cause skin burn. Exposure can cause dizziness, lightheadedness, and unconsciousness. Petroleum naphtha has a lower order of toxicity than that derived from coal tar, where the major hazard is brought about by the aromatic hydrocarbon content. Sufficient quantities of both naphthas cause central nervous system depression. Symptoms include eye irritation; followed by headache and nausea. In severe cases, dizziness, convulsions, and unconsciousness occasionally result. Symptoms of anorexia and nervousness have been reported to persist for several months following an acute overexposure, but this appears to be rare. One fraction, hexane, has been reported to have been associated with peripheral neuropathy. If benzene is present, coal tar naphthas may produce blood changes, such as leukopenia, aplastic anemia, or leukemia. The kidneys and spleen have also been affected in animal experiments. At vapor concentrations up to 450 ppm, petroleum naphtha inhalations may produce slight throat irritation. At 880 ppm, definite throat irritation is observed. Vapors may also irritate the nose. High concentrations may produce difficulty in breathing; Blue coloration of skin, excitement and dizziness. Inhalation of vapors in the absence of oxygen is immediately life-threatening. A vapor concentration up to 450 ppm mild, temporary irritation is observed; @ 880 ppm more severe irritation may be experienced. Human Tox = 14,00000 ppb (INTERMEDIATE)

Long-Term Exposure: Irritates the eyes and upper respiratory system. Coal tar naphtha may contain benzene, a cancer-causing agent in humans. Exposure may cause nervous system and kidney damage. Some coal tar naphthas contain other substances that can cause blood cell damage. Longer exposure may cause drying and cracking of the skin, and make the skin sunburn more easily. Swallowing the liquid may cause chemical pneumonia.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: Preplacement and periodic medical examinations should include the central nervous system. If benzene exposure is present, workers should have a periodic CBC including hematocrits, hemoglobin, white blood cell count and differential count, mean corpuscular volume and platelet count, reticulocyte count, serum bilirubin determination, and urinary phenol in the preplacement examination and @ 3-month intervals. There are no specific diagnostic tests for naphtha exposure but urinary phenols may indicate exposure to benzene and aromatic hydrocarbons. It should be noted that benzene content of vapor may be higher than predicted by content in the liquid.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get immediate medical attention.

Note to physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitrile, Neoprene rubber, Silvershield, chlorinated polyethylene; styrene-butadiene rubber, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Coal tar naphthas: Up to 1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Causes eye irritation or damage; may require eye protection.

Petroleum naphtha: NIOSH: *Up to 850 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 1100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); *SCBAF (APF = 50) (any SCBA with a full facepiece); SaF (APF = 50) (any supplied-air respirator with a full facepiece).

Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

VM&P naphtha: 3500 milligram per cubic meter: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *8750 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *17,500 milligram per cubic meter:* CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece).

Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Naphthas must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where naphthas are handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of naphthas should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of naphtha. Wherever naphtha is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1136 Coal tar distillates, flammable, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Theses chemicals are flammable liquids. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Use water for cooling only. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Naphthalene is a colorless to brown crystalline solid with a characteristic "moth ball" odor. Shipped as a molten solid. Molecular weight = 128.17; specific gravity (H_2O:1) = 1.03 @ 20°C; boiling point = 217.8°C; freezing/melting point = 80.3°C; vapor pressure = 0.08 mmHg @ 20°C; flash point = 78.9°C; autoignition temperature = 540°C. Explosive limits: LEL = 0.9%; UEL: 5.9%. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0. Practically insoluble in water; solubility = 0.003%.

Potential Exposure: Naphthalene is used as a chemical intermediate or feedstock for synthesis of phthalic, anthranilic, hydroxyl (naphthols), amino (naphthylamines), and sulfonic compounds; which are used in the manufacture of various dyes and in the preparation of phthalic anhydride, 1-naphthyl-*N*-methyl carbonate; and β-naphthol. Naphthalene is also used in the manufacture of hydronaphthalenes, synthetic resins; lampblack, smokeless powder; and celluloid. Naphthalene has been used as a moth repellent.

Approximately 100 million people worldwide have G6PD deficiency which would make them more susceptible to hemolytic anemia on exposure to naphthalene. At present, more than 80 variants of this enzyme deficiency have been identified. The incidence of this deficiency is 0.1% in American and European Caucasians, but can range as high as 20% in American blacks and greater than 50% in certain Jewish groups. Newborn infants have a similar sensitivity to the hemolytic effects of naphthalene, even without G6PD deficiency.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Violent reactions with chromium(III) oxide, dinitrogen pentoxide; chromic anhydride.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 ppm

Odor threshold = 0.038 ppm

OSHA PEL: 10 ppm/50 milligram per cubic meter TWA

NIOSH REL: 10 ppm/50 milligram per cubic meter TWA; 15 ppm/75 milligram per cubic meter STEL

ACGIH TLV[1]: 10 ppm/52 milligram per cubic meter TWA; 15 ppm/79 milligram per cubic meter STEL [skin]

DFG MAK: [skin] Carcinogen Category 3B

PAC Ver. 29[138]

PAC-1: 15 ppm

PAC-2: 83 ppm

PAC-3: 500 ppm

Arab Republic of Egypt: TWA 10 ppm (50 milligram per cubic meter), 1993; Austria: MAK 10 ppm (50 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (52 milligram per cubic meter); STEL 15 ppm (79 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (50 milligram per cubic meter), 1999; Finland: TWA 10 ppm (50 milligram per cubic meter); STEL 20 ppm (100 milligram per cubic meter), 1999; France: VME 10 ppm (50 milligram per cubic meter), 1999; Hungary: TWA 40 milligram per cubic meter; STEL 80 milligram per cubic meter [skin], 1993; the Netherlands: MAC-TGG 50 milligram per cubic meter, 2003; Norway: TWA 10 ppm (50 milligram per cubic meter), 1999; the Phillipines: TWA 10 ppm (50 milligram per cubic meter), 1993; Poland: MAC (TWA) 20 milligram per cubic meter; MAC (STEL) 75 milligram per cubic meter, 1999; Russia: STEL 20 milligram per cubic meter, 1993; Switzerland: MAK-W 10 ppm (50 milligram per cubic meter), 1999; United Kingdom: TWA 10 ppm (53 milligram per cubic meter); STEL 15 ppm (80 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 15 ppm [skin]. Russia[43] set a MAC in ambient air in residential areas of 0.003 milligram per cubic meter (3 μ/m^3). Several states have set guidelines or standards for naphthalene in ambient air[60] ranging from 14 μ/m^3 (Massachusetts) to 166.7 μ/m^3 (New York) to 500 μ/m^3 (Florida) to 500–750 μ/m^3 (North Dakota) to 800 μ/m^3 (Virginia) to 1000 μ/m^3 (Connecticut) to 1190 μ/m^3 (Nevada) to 1250 μ/m^3 (South Carolina).

***Determination in Air*:** Use NIOSH Analytical Methods #1501; OSHA Analytical Method 35.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 100 μg/L; State Drinking Water Standards: New Jersey 300 μg/L; State Drinking Water Guidelines: California 170 μg/L; Connecticut 6.5 μg/L; Florida 100 μg/L; Massachusetts 140 μg/L; Maine 14 μg/L; Minnesota 300 μg/L; Wisconsin 100 μg/L.

Determination in Water: Methylene chloride extraction followed by high pressure liquid chromatography with fluorescence or UV detection; or gas chromatography (EPA Method 610) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol–water coefficient: Log $K_{ow} = 3.3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of vapor or dust, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. High levels cause headache, fatigue, confusion, excitement, malaise, nausea, and vomiting. *Inhalation:* Levels above 10 ppm may cause headache, nausea, excessive sweating, and vomiting. *Skin:* May cause irritation. If hypersensitive to naphthalene, severe irritation may occur.

Eyes: Levels above 15 ppm may cause irritation. Direct contact may cause severe irritation, injury to the cornea and a blurring of vision. *Ingestion:* Ingestion of 0.5 g (1/60 ounce) may cause nausea, vomiting, abdominal pain; irritation of the bladder; and brown or black coloration of the urine. The symptoms usually disappear after a few days. Animal studies indicate that the probable lethal dose for an adult is 5–15 g (1/16–0.5 ounce).

Long-Term Exposure: Repeated exposure or ingestion may cause clouding of the eye (cataract). Inhalation of levels above 10 ppm may cause headaches, nausea, vomiting and a feeling of general discomfort. Chronic skin problems are rare, except in cases of hypersensitivity. May cause skin allergy, kidney, and liver damage. May damage the red blood cells, causing anemia.

Points of Attack: Eyes, skin, blood, liver, kidneys, central nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: blood plasma, hemoglobin; CBC; liver function tests; red blood cells/count, RBC hemolysis; urine (chemical/metabolite); hemoglobin; urinalysis (routine); white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following is recommended before beginning work and at regular times after that: exam of the eyes and vision. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests, CBC. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Up to 2.5 milligram per cubic meter: Qm (APF = 25) (any quarter-mask respirator). *Up to 5 milligram per cubic meter:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or any supplied-air respirator.* *Up to 12.5 milligram per cubic meter:* Sa:Cf (any supplied-air respirator operated in a continuous-flow mode)*; or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 25 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) 100, or P100 filter); or any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter*; or any SCBA with a full facepiece; or any supplied-air respirator with a full facepiece. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Naphthalene must be stored to avoid contact with chromium(III) oxide, dinitrogen pentoxide; and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where naphthalene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of naphthalene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Liquid naphthalene must avoid contact with water.

Shipping: UN1334 Naphthalene, crude or Naphthalene, refined, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN2304 (molten) Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep naphthalene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid but is not easily ignited. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Use caution when using water spray or foam directly on molten naphthalene as extensive foaming may occur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

1-Naphthaleneacetic Acid N:0128

Formula: $C_{12}H_{10}O_2$

Synonyms: Agronaa; Alco NAA; Alpha-Spra; Amcotone; ANA; APPL-SET; Celmone; Destruxol; Dip'n Grow; Fruitone; Goldengro; Hormex; Klingtite; Liqui-Stik; NAA; NAA 800; Nafusaku; Naphthaleneacetic acid(1-); α-Naphthaleneacetic acid; Naphthalene-1-acetic acid; Naphthylacetic acid; α-Naphthylacetic; α-Naphthylacetic acid; 1-Naphthylacetic acid; α-Naphthyleneacetic acid; Niagara-Stik; Nu-Tone; Parmone; Phymone; Pimacol-Sol; Planofix; Plucker; Primacol; Rhizopon b rooting powder; Rootone (component, with indole-3-butyric acid and 1-naphthaleneacetamide); Stafast; Stik; Stop-Drop; Tekkam; Tipoff; Transplantone (component, with 1-naphthaleneacetamide); Tre-Hold; Vardhak

CAS Number: 86-87-3

HSDB Number: 2038

RTECS Number: QJ0875000

UN/NA & ERG Number: UN1759 (Corrosive solids, n.o.s.)/154

EC Number: 201-705-8

Regulatory Authority and Advisory Information

Hazard Alert: Poison (DOT). Combustible, Corrosive solid, Suspected reprotoxic hazard, Agricultural chemical.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C, Xn, Xi; risk phrases: R22; R34; R36/37/38; R41; R51; R63; R68; safety phrases: S22; S23; S24/25; S26; S27; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: α-Naphthyleneacetic acid is a white crystalline solid, needles, powder, or colorless liquid. Odorless. Molecular weight = 186.21; boiling point = (decomposes) 322°C; 352°C; freezing/melting point = 134°C; vapor pressure = very low; negligible. Soluble in water; aqueous solution is acidic.

Potential Exposure: A carboxylic acid plant growth regulator used for thinning fruit sets in apples, pears, olives, and some citrus. Induces root formation on cuttings and transplants. Inhibits fruit drops. Not currently registered in EU countries (may be pending).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, chlorates nitrates, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.6$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—4918.96611 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Inhalation, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Dusts may cause skin, and respiratory tract irritation. Eye irritation may be severe. Ingestion may cause upset stomach and affect central nervous system. LD_{50} (oral, rat) = 1000− >1750 mg/kg; (dermal, rat) = >2 g/kg.

Long-Term Exposure: Possible blood toxin; may cause lower blood cell count. May be a developmental and reproductive toxin. Human toxicity (long term)[101]: Very low—350.00 ppb, Health Advisory.

Points of Attack: Blood, central nervous system, eyes.

Medical Surveillance: CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: (1) Color code—Blue: Health Hazard/Poison. Store in a secure poison location. (2) White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN1759 Corrosive solids, n.o.s., Hazard Class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol-resistant foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Naphthenic Acid N:0130

Formula: Mixture: $R_2C\text{-}CR_2\text{-}CR_2\text{-}CR_2\text{-}CR\text{-}(CH_2)_n\text{-}COOH$ (where $n = 2-6$); $C_nH_{2n}1COOH$; C_7H1O_2

Synonyms: Acido naftalico (Spanish); Agenap; Agenap HMW-H; Cyclopentane carboxylic acid; Naphid; Sunaptic acid B; Sunaptic acid C

CAS Registry Number: 1338-24-5

HSDB Number: 1178

RTECS Number: QK8750000

UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 215-662-8

Regulatory Authority and Advisory Information

Carcinogenicity: DFG MAK: Carcinogenic: Category 3B, chemical of concern.

Hazard Alert: Combustible, Sensitization hazard (skin), Environmental hazard.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, N; risk phrases: R40; R36/37/38; R43; R50; R51/53; safety phrases: S26; S29/35; S36/37; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Naphthenic acid is a gold to black, odorless liquid. Molecular weight = (approx.) 200−250 (mixture); specific gravity (H_2O:1) = 0.982 @ 20°C; boiling point = 132−243°C; freezing/melting point = 31°C; flash point = 149°C (oc). Explosive limits: LEL = 0.9−1%; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0. Slightly soluble in water.

Potential Exposure: Used to make metallic naphthenates for paint dryers and cellulose preservatives. It is also used as a solvent; detergent, rubber reclaiming agent. Used in catalysts, cutting oils; drilling compounds; rust inhibitors; surfactants, emulsions, grease, and wood preservatives.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water, and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with sulfuric acid, caustics, ammonia, aliphatic amines; alkanolamines, isocyanates, alkylene oxides; epichlorohydrin, strong oxidizers. Corrosive to metals.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices. DFG MAK: Carcinogen Category 3B, chemical of concern.

Harmful Effects and Symptoms

Short-Term Exposure: Vapors irritate the eyes, skin, and respiratory tract. Contact with the skin caused reddening. Principal effect is that of mild primary irritation when encountered in high concentrations. Inhalation of vapor causes coughing. Liquid is moderately irritating to eyes and slightly to moderately irritating to skin; excessive exposure could result in dermatitis[136].

Long-Term Exposure: Repeated or prolonged contact causes dry and cracked skin; and may cause contact dermatitis. May cause liver and central nervous system damage.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Evaluation by a dermatologist. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from metals and other incompatible materials listed above. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of carbon and may contain other oxides of carbon.

Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 205-182-7 [*Annex I Index No.:* 604-007-00-5]
Regulatory Authority and Advisory Information
Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.
Canada, WHMIS, Ingredients Disclosure List Concentration 1%.
Hazardous to aquatic life or environment, with possible long lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R20/22; R51/53; R60; R62; safety phrases: S2; S24/25; S29/35; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.
Description: 2-Naphthol is a white, crystalline solid. Slight phenolic odor. Darkens in air and on exposure to light. Molecular weight = 144.18; specific gravity (H_2O:1) = 0.58 @ 0°C; boiling point = 286°C; freezing/melting point = 123°C; vapor pressure = 10 mmHg @ 46°C; flash point = 153°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0; (1-naphthol) Health 3, flammability 1, reactivity 1. Slightly soluble in water.
Potential Exposure: A potential danger to those involved in rubber antioxidant production, synthesis of dyes; leather processing; fungicides, pharmaceuticals, and perfumes. Used as an antioxidant for fats, oils; as an antiseptic; in insecticides.
Incompatibilities: Dust or powder may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, iron salts; 2,3-dimethyl-1-phenyl-3-pyrazolin-5-one (antipyrine); camphor, phenol, menthol, urethane.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 5.9 milligram per cubic meter
PAC-2: 65 milligram per cubic meter
PAC-3: 390 milligram per cubic meter
Russia: STEL 0.1 milligram per cubic meter, 1993
Russia[43] set a MAC in ambient air in residential areas of 0.006 milligram per cubic meter on a momentary basis and 0.003 milligram per cubic meter on a daily average basis.
Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.4 mg/L.
Routes of Entry: Inhalation; skin absorption.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the skin and eyes. Ingestion can cause nephritis, lens opacity, vomiting, diarrhea, abdominal pain; circulatory collapse; convulsion, hemolytic anemia, and death.
Long-Term Exposure: May cause kidney damage, anemia. May cause mutations.
Points of Attack: Eyes, skin, blood, liver, kidneys, central nervous system.
Medical Surveillance: CBC, kidney damage.
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved

and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA.

Storage: Color code—Blue (1-naphthol): Health Hazard/Poison: Store in a secure poison location. Color code—Green (2-naphthol): General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dark place.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mix with flammable solvent and atomize into an incinerator.

Hazardous to aquatic life or environment, with possible long lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, C, Xi; risk phrases: R25; R26; R36/37/38; R43; R50/53; R34; R62; R63; safety phrases: S16; S24; S26; S29/35; S36/37/39; S38; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 1,4-Naphthoquinone is a yellow to greenish-yellow crystalline solid. Pungent odor like benzoquinone. Molecular weight = 158.15; specific gravity (H_2O:1) = 1.4 @ 20°C; sublimation point = 100°C; freezing/melting point = 129°C; vapor pressure = 0.2 mmHg @ 50°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: 1,4-Naphthoquinone is used as a polymerization regulator for rubber and polyester resins; in the synthesis of dyes and pharmaceuticals; and as a fungicide and algicide.

Incompatibilities: Ketones are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrated amines, azo, diazo, azido compounds, carbamates, organic cyanates. May react with many acids and bases liberating heat and flammable gases (e.g., hydrogen) generating heat may be sufficient to start a fire in the unreacted portion of the ketone. May react with reducing agents such as hydrides, alkali metals, and nitrides to produce flammable gas (e.g., hydrogen) and heat. Incompatible with isocyanates, aldehydes, cyanides, peroxides, and anhydrides. May react violently with aldehydes[101].

Permissible Exposure Limits in Air

Odor threshold = 0.02 ppm

PAC Ver. 29[138]

PAC-1: 0.57 milligram per cubic meter

PAC-2: 6.3 milligram per cubic meter

PAC-3: 38 milligram per cubic meter

Russia: STEL 0.1 milligram per cubic meter [skin], 1993

Russia[43] set a MAC in ambient air in residential areas of 0.005 milligram per cubic meter both on a momentary and a daily average basis.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Long-Term Exposure: The most consistent findings reported in the literature for health effects of 1,4-naphthoquinone involve hematological changes; irritant and allergenic activity; and inhibition of biochemical oxidation processes. One study found 1,4-naphthoquinone to be oncogenic. Some evidence of inhibition of *in vitro* endocrine function and of nerve activity was reported.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft. (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: α-Naphthylamine exists as white needle-like crystals which turn red on exposure to air. Has a weak ammonia-like odor. Molecular weight = 143.19; specific gravity (H_2O:1) = 1.02 @ 20°C; boiling point = 301°C; freezing/melting point = 49°C; vapor pressure = 4.2×10^{-3} mmHg @ 25°C; flash point = 157.2°C; autoignition temperature = ~450°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Practically insoluble in water; solubility = 0.002%; 1 mg/mL at 20°C[193].

Potential Exposure: α-Naphthylamine is used as an intermediate in dye production; for manufacturing herbicides and antioxidants; in the manufacture of condensation colors, rubber, and in the synthesis of many chemicals, such as α-naphthol, sodium naphthionate; *o*-naphthionic acid; Neville and Winther's acid; sulfonated naphthylamines, α-naphthylthiourea (a rodenticide); and *N*-phenyl-α-naphthylamine.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrous acid, organic anhydrides, isocyanates, aldehydes. Oxidizes on contact with air.

Permissible Exposure Limits in Air

OSHA: Cancer Suspect Agent, see 29CFR1910.1003.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 2 milligram per cubic meter

PAC-2: 22 milligram per cubic meter
PAC-3: 130 milligram per cubic meter
Austria: carcinogen, 1999; Poland: MAC (TWA) 0 milligram per cubic meter, MAC (STEL) 0 milligram per cubic meter, 1999; Sweden: carcinogen, 1993. α-Naphthylamine is included in the Federal standard for carcinogens; all contact with it should be avoided[63]. Several states have set guidelines or standards for 1-naphthylamine in ambient air[60] ranging from zero in South Carolina to 0.03 μ/m^3 (New York).

Determination in Air: Use NIOSH Analytical Method #5518, Naphthylamines; OSHA Analytical Method 93

Determination in Water: Octanol−water coefficient: Log K_{ow} = <2.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Percutaneous absorption.

Harmful Effects and Symptoms

Short-Term Exposure: 1-Naphthylamine can affect you when breathed in and by passing through your skin. 1-Naphthylamine should be handled as a carcinogen with extreme caution. High exposure can cause the skin and lips to turn blue. This reduces the ability of the blood cells to carry oxygen to body organs (methemoglobinemia). Higher levels can cause breathing difficulties, collapse, and possible death.

Long-Term Exposure: Some related chemicals can damage the liver and/or cause skin allergies. It is not known whether 1-naphthylamine has these effects. A report of excess bladder cancer among individuals who worked with this chemical has been published. This may be due to contamination with 2-naphthylamine, a known human carcinogen.

Points of Attack: Bladder, skin. *Cancer site:* bladder cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. OSHA mandates the following tests or information: *Increased Risk:* reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking.* NIOSH lists the following tests: *increased risk:* reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; cystoscopy; urinalysis (routine). Before beginning employment and at regular times after that, the following are recommended: urine cytology (a test for abnormal cells in the urine). A urine test for 1-naphthylamine can also be done to determine whether this cancer agent is entering the body. For accuracy, it should be done shortly after exposure. If symptoms develop or overexposure is suspected, the following may be useful: test for methemoglobin (most accurate a few hours after exposure; the blood sample must be promptly tested).**Code of Federal Regulations. 29 CFR Part 1910.1000. Subpart Z. Air Contaminants.* United States Government Printing Office (July 1, 2004).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2077 *alpha*-Naphthylamine, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. PGIII.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1-Naphthylamine may burn, but does not readily ignite. Use dry chemical, CO_2, water spray; or foam extinguishers; however, water or foam may cause frothing. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalyst, or thermal device. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: 2-Naphthylamine is a white to red crystals with a faint, aromatic odor. Darkens in air to a reddish-purple color. Molecular weight = 143.20; specific gravity (H_2O:1) = 1.06 @ 97.8°C; boiling point = 294°C; freezing/melting point = 109–110°C; vapor pressure = 1 mmHg @ 104°C; flash point = 157°C. Soluble in hot water.

Potential Exposure: 2-Naphthylamine is presently used only for research purposes. It is present as an impurity in α-naphthylamine. It is as an intermediate in the preparation of other compounds. 2-Naphthylamine was widely used in the manufacture of dyestuffs; as an antioxidant for rubber; and in rubber coated cables.

Incompatibilities: A weak base. Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with nitrous acid.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined. Potential occupational carcinogen.

ACGIH TLV[1]: Exposure by all routes should be carefully controlled to levels as low as possible; Confirmed Human Carcinogen

PAC not available.

DFG MAK: [skin]; Carcinogen Category 1

Australia: carcinogen, 1993; Austria [skin] carcinogen, 1999; Belgium: carcinogen, 1993; Finland: carcinogen, 1999; France: VME 0.001 ppm (0.005 milligram per cubic meter), continuous; carcinogen, 1993; Poland: MAC (TWA) 0 milligram per cubic meter, MAC (STEL) 0 milligram per cubic meter, 1999; Sweden: carcinogen, 1999; Switzerland: [skin] carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. 2-Naphthylamine is included in the federal standard for carcinogens; all contact with it should be avoided. ACGIH states that β-naphthylamine is a human carcinogen without an assigned TLV. Several states have set guidelines of standards for 2-naphthylamine in ambient air[60] ranging from zero (North Dakota, New York, and South Carolina) to 3.0 μ/m^3 (Virginia) to 19.07 μ/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method #5518, Naphthylamines; OSHA Analytical Method 93

Permissible Concentration in Water: Octanol–water coefficient: Log K_{ow} = <2.5. Unlikely to bioaccumulate in marine organisms. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment. EPA[32] has suggested an ambient level goal based on health effects of 291 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Percutaneous absorption.

Harmful Effects and Symptoms

Short-Term Exposure: 2-Naphthylamine is irritating to the eyes and skin; has produced contact dermatitis. High levels can interfere with the blood's ability to carry oxygen (methemoglobinemia). Higher levels can cause breathing difficulties, collapse, and even death.

Long-Term Exposure: 2-Naphthylamine is a known human bladder carcinogen with a latent period of about 16 years. The symptoms are frequent urination, dysuria, and hematuria. Acute poisoning leads to methemoglobinemia or acute hemorrhagic cystitis. 2-Naphthylamine is carcinogenic, producing urinary bladder carcinomas in hamsters, dogs, and nonhuman primates; and hepatomas in mice, after oral administration. Epidemiological studies have shown that occupational exposure to 2-naphthylamine, either alone or when present as an impurity in other compounds, is causally associated with bladder cancer.

Points of Attack: Bladder, skin. *Cancer site:* bladder cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. OSHA mandates the following tests or information: *increased risk:* reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking.* NIOSH lists the following tests: *increased risk:* reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; cystoscopy; urinalysis (routine). Preplacement and periodic examinations should include an evaluation of exposure to other carcinogens; use of alcohol, smoking, and medications; and family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, cystoscopy should be done at once. The general health of exposed persons should also be evaluated in periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store away from heat and light in a refrigerator or a cool, dry place away from incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045 and 1910.1003.

Shipping: UN1650 β-Naphthylamine, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% acetone to avoid airborne dust. Transfer to vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalyst, or thermal device[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Napropamide N:0173

Formula: $C_{17}H_{21}NO_2$

Synonyms: Colzor trio (dimethachlor + napropamide + clomazone); Devrinol; *N,N*-Diethyl-2-(1-naphthalenyloxy) propanamide; 2-(1-Naphthoxy)-*N,N*-diethylpropionamide; [2-(α-Naphthoxy)-*N,N*-diethylpropionamide]; Naproguard; R-7165; Waylay

CAS Number: 15299-99-7

HSDB Number: 6710

RTECS Number: UE3600000

UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 239-333-3

Regulatory Authority and Advisory Information

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R51/53; safety phrases: S2; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Colorless crystalline solid (pure). Technical form is tan to brown solid. Molecular weight = 271.35; specific gravity (H_2O:1) = 1.18; boiling point = 317°C; freezing/melting point = 73.5°C; vapor pressure = 1.72×10^{-7} mm @ 20°C[83]. Soluble in water; solubility = 73 mg/L @ 20°C.

Potential Exposure: A amide/alkanamide general use pesticide and herbicide that is compatible with many other fungicides and herbicides. Used to control broadleaf weeds and annual grasses on a variety of crops including vegetables, fruit trees; fruit bushes, oil seed rape, vines, sunflowers, olives, tobacco, and mint.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salt.

Permissible Exposure Limits in Air:

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: 800 ppb[14].

Determination in Water: Octanol−water coefficient: Log $K_{ow} = >3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, dermal, and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the respiratory tract.

LD_{50} (oral, rat) = >4500 mg/kg; (dermal, rat) = >2 g/kg.

Long-Term Exposure: Possible liver and kidney toxin.

Points of Attack: Liver, kidneys

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to amides exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers; strong acids; strong alkalies. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nifluridide decomposes forming toxic and corrosive gases, including oxides of nitrogen and carbon. This chemical is a combustible solid. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft. for liquids and at least 25 m/75 ft. for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be destroyed by alkaline hydrolysis. Admixture with alkali can be followed by soil burial. Larger quantities can be disposed of by incineration in admixture with acetone or xylene and using effluent gas scrubbing.

Neon N:0190

Formula: Ne

Synonyms: Neon, elemental

CAS Registry Number: 7440-01-9

HSDB Number: 7916

RTECS Number: QP4450000

UN/NA & ERG Number: UN1065 (compressed); UN1913 (liquid)

EC Number: 231-110-9

Regulatory Authority and Advisory Bodies

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R5; R21; safety phrases: S9; S33; S38; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Neon is an inert, colorless, odorless, tasteless gas or liquid. Molecular weight = 20.18; specific gravity (H_2O:1) = 1.2 @ −246°C (BP); boiling point = −246°C; freezing/melting point = −246°C. Slightly soluble in water.

Potential Exposure: Neon is used in photoelectric bulbs and certain light tubes; in the electronic industry; in lasers; in plasma studies; and other research.

Incompatibilities: Compressed neon gas under pressure may explode when heated.

Permissible Exposure Limits in Air

ACGIH TLV[1]: Simple asphyxiant

PAC Ver. 29[138]

PAC-1: 65,000 ppm

PAC-2: 230E + 05 ppm

PAC-3: 400E + 05 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: asphyxiant, 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Simple asphyxiant. Large amounts of neon will decrease the amount of available oxygen. Oxygen content should be tested to ensure that it is at least 19% by volume.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Neon can affect you when breathed in. Exposure can cause you to feel dizzy and lightheaded. Very high levels can cause you to pass out and could cause suffocation from lack of oxygen. Contact with liquefied neon could cause frostbite. Before entering a confined space be certain that sufficient oxygen exists.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Eye protection is required in laser operations to avoid eye burning. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash (gloves, footwear, headgear) which should be clean, available each day, and put on before work. Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues.

Respirator Selection: Exposure to neon is dangerous because it can replace oxygen and lead to suffocation. Only

NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Storage areas should be dry and well ventilated. Protect cylinders of neon from physical damage. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1065 Neon and UN1913 Neon, refrigerated liquid (cryogenic liquid), Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas, but pressurized containers may explode in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Vapors are heavier than air and will collect in low areas. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Venting to atmosphere.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Neon, Trenton, NJ (September 2001).

Neopentane N:0200

Formula: C_5H_{12}; $CH_3C(CH_3)_2CH_3$

Synonyms: 2,2-Dimethylpropane; Dimethylpropane; Neopentane; *tert*-Pentane; Propane, 2,2-dimethyl-; Tetramethylmethane; 1,1,1-Trimethylethane

CAS Registry Number: 463-82-1

HSDB Number: 110

RTECS Number: TY1190000

UN/NA & ERG Number: UN2044/115

EC Number: 207-343-7 [*Annex I Index No.:* 601-005-00-6]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Hazard Alert: Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Environmental hazard.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Canada, WHMIS, Ingredients Disclosure List (neopentane not listed) *n*-pentane Concentration 1%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, N; risk phrases: R5; R12; R21; R44; R53; safety phrases: S1; S2; S9; S16; S29; S33; S38; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Neopentane is an extremely flammable gas and volatile liquid. Molecular weight = 72.17; specific gravity (H_2O:1) = 0.6 @ 0°C; boiling point = 9.5°C; flash point = (gas) −17°C. Explosive limits: LEL = 1.4%; UEL: 7.5%; Autoignition temperature = 450°C. Hazard identification (based on NFPA-704 M Rating System): Health 0; flammability 4; reactivity 0. Insoluble in water.

Potential Exposure: Neopentane is used as a gasoline blending component; for making butyl rubber. A research chemical. Reacts with strong oxidizers, causing fire and explosion hazard. Attacks some plastics, rubbers, and coatings.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

OSHA give limits for *n-pentane* as do several states, but they do not single out "neopentane." *This is shown for reference only.*

NIOSH IDLH = 1500 ppm [LEL]

OSHA PEL: 1000 ppm/2950 milligram per cubic meter TWA

NIOSH REL: 120 ppm/350 milligram per cubic meter TWA

ACGIH TLV[1]: 600 ppm/1770 TWA

PAC Ver. 29[138]

PAC-1: 3000 ppm

PAC-2: 33,000 ppm

PAC-3: 2.00E + 05 ppm

DFG MAK: 1000 ppm/3000 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C

Austria: MAK 600 ppm (1899 milligram per cubic meter), 1999; Denmark: TWA 500 ppm (1500 milligram per cubic meter), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 600 ppm.

United Kingdom[33] TWA 600 ppm (1800 milligram per cubic meter); STEL of 750 ppm (2250 milligram per cubic meter) (all isomers of pentane).

Determination in Air: Charcoal tube; CS_2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1500, Hydrocarbons.

Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = >3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can cause skin irritation and severe burns with redness, itching. May affect the central nervous systems. Skin contact with the undiluted material for 5 hours causes blisters; for one hour it causes irritation, itching, erythema, pigmentation, swelling, burning and pain. Skin contact can cause frostbite. Inhalation can cause headache, dizziness, and suffocation. The toxicity is via the inhalation route. It is narcotic in high concentrations. Ingesting the liquid may cause chemical pneumonia (aspiration).

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. See above.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as pentane): *1200 ppm:* Sa (APF = 10) (any supplied-air respirator). *1500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2044 2,2-Dimethylpropane, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Niacinamide N:0210

Formula: $C_6H_6N_2O$

Synonyms: Acidamide; Nicotimanide; Nicotine acid amide; 3-Pyridine carboxamide; 3-Pyridine carboxylic acid amide; VI-Nicotyl; VI-Nictyl; Vitamin B_3; Vitamin Pp

CAS Registry Number: 98-92-0

HSDB Number: 1237

RTECS Number: QS3675000

EC Number: 202-713-4

Regulatory Authority and Advisory Information

Hazard Alert: Combustible solid, Suspected of causing genetic defects.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/37/38; R41; R60; R61; R62; safety phrases: S16; S26; S27; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Niacinamide is a white crystalline powder or forms colorless needle-like crystals. Molecular weight = 122.14; specific gravity (H_2O:1) = 1.4 @ 20°C; boiling point = 155°C; freezing/melting point = 129−130°C; vapor pressure = 4.2×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 0. Highly soluble in water.

Potential Exposure: Used as a dietary supplement and food additive.

Incompatibilities: Combustible solid; dust may form explosive mixture with air. Amides are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 5.6 milligram per cubic meter

PAC-2: 62 milligram per cubic meter

PAC-3: 690 milligram per cubic meter

Routes of Entry: Ingestion; deral and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: These symptoms reported from cases of medical treatment or self-prescribed massive vitamin dosage. The sudden onset of nausea, vomiting, and fatigue have been reported following increased dose from 4−9 g daily. From animal studies, the lethal human dose has been estimated to be about 0.5 pound.

Long-Term Exposure: The recommended dietary supplement is 10−20 mg per day. This level causes no adverse effects. Levels of 4−9 g per day may cause nausea and vomiting, as well as serious changes in liver tissue and enzymes. May cause mutations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long lasting effects: powder[194].

Hazard symbols, risk, & safety statements: Hazard symbol (*powder*): T, F+, N, Xi; risk phrases: R10 (powder); R17; R40; R43; R48/23; R51/53; R62; R63; safety phrases: S2; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*nickel metal; nickel powder, particle size <0.1 mm*); 1-Low hazard to water. (*nickel, particle size >0.1 mm*).

Description: Nickel metal is a hard, ductile, magnetic metal with a silver-white color. Molecular weight = 58.7; specific gravity (H_2O:1) = 8.9 @ 20°C; boiling point = 2837°C; 29.13°C; freezing/melting point = 1455°C. Hazard identification (based on NFPA-704 M Rating System) (*powder*): Health 2; flammability 4; reactivity 1; (*metal*) Health 1; flammability 0; reactivity 0. Insoluble in water. It occurs free in meteorites and in ores combined with sulfur, antimony, or arsenic. Processing and refining of nickel is accomplished by either the Oxford (sodium sulfide and electrolysis) or the Mond (nickel carbonyl) processes. In the latter, impure nickel powder is reacted with carbon monoxide to form gaseous nickel carbonyl which is then treated to deposit high purity metallic nickel.

Potential Exposure: Nickel is used as an alloy additive in steel manufacture; in the production of coins and other utensils. Nickel forms alloys with copper, manganese, zinc, chromium, iron, molybdenum, etc. Stainless steel is the most widely used nickel alloy. An important nickel−copper alloy is Monel metal, which contains 66% nickel and 32% copper and has excellent corrosion resistance properties. Permanent magnets are alloys chiefly of nickel, cobalt, aluminum, and iron. Elemental nickel is used in electroplating, anodizing aluminum casting operations for machine parts; and in coinage; in the manufacture of acid-resisting and magnetic alloys; magnetic tapes; surgical and dental instruments; nickel−cadmium batteries; nickel soaps in crankcase oil; in ground-coat enamels; colored ceramics; and glass. It is used as a catalyst in the hydrogenation synthesis of acrylic esters for plastics. Exposure to nickel may also occur during mining, smelting, and refining operations. The route by which most people in the general population receive the largest portion of daily nickel intake is through food. Based on the available data from composite diet analysis, between 300 and 600 μg nickel per day are ingested. Fecal nickel analysis, a more accurate measure of dietary nickel intake, suggests about 300 μg per day. The highest level of nickel observed in water was 75 μg/L. Average drinking water levels are about 5 μg/L. A typical consumption of 2 L daily would yield an additional 10 μg of nickel, of which up to 1 μg would be absorbed.

Incompatibilities: Nickel dust is a spontaneously flammable solid and a dangerous fire hazard.

Permissible Exposure Limits in Air

NIOSH IDLH = 10 mg[Ni]/m^3

OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA

NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1] (*elemental*): 1.5 mg[Ni]/m^3 inhalable fraction TWA; not suspected as a human carcinogen; (*inorganic, insoluble compounds*) 0.2 mg[Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen; (*inorganic, soluble compounds*) 0.1 mg[Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.

PAC Ver. 29[138]

PAC-1: 4.5 milligram per cubic meter

PAC-2: 50 milligram per cubic meter

PAC-3: 99 milligram per cubic meter

DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1 DFG TRK: 0.50 μg[Ni]/L in urine, after several shifts; Category 1, human carcinogen, as inhalable dusts/aerosols from nickel metal, nickel carbonate arising in production and processing.

Arab Republic of Egypt: TWA 0.1 milligram per cubic meter, 1993; Australia: TWA 1 milligram per cubic meter, 1993; Austria: carcinogen, 1999; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.1 milligram per cubic meter [skin] carcinogen, 1999; France: VME 1 milligram per cubic meter, continuous carcinogen, 1999; Hungary: STEL 0.005 mg[Ni]/m^3, Carcinogen (insoluble compounds), 1993; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; the Phillipines: TWA 1 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.25 milligram per cubic meter, 1999; Russia: STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.5 milligram per cubic meter (*dust*), 1999; Switzerland: MAK-W 0.5 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 1 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Confirmed Human Carcinogen. Russia[35][43] set a MAC in ambient air in residential areas of 0.0002 milligram per cubic meter for soluble nickel salts. Various states have set guidelines or standards for nickel in ambient air[60] ranging from 0.002 μ/m^3 (Rhode Island) to 0.002−0.018 μ/m^3 (Massachusetts) to 0.0303 μ/m^3 (Kansas) to 0.13−0.70 μ/m^3 (Montana) to 0.24 μ/m^3 (Pennsylvania) to 0.5 μ/m^3 (North Carolina and South Carolina) to 1.0 μ/m^3 (North Dakota) to 2.0 μ/m^3 (Nevada) to 3.3 μ/m^3 (New York) to 5.0 μ/m^3 (Connecticut) to 10.0 μ/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/perchloric acid ashing); #7301, Elements by ICP (Aqua regia ashing); #7303, Elements by ICP [Hot block (HCl/HNO_3 Digestion)]; #9102, Elements on wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 100 μg[Ni]/L; State Drinking Water Standards: California 100 μg[Ni]/L; Connecticut: 100 μg [Ni]/L; Delaware: 100 μg[Ni]/L; Wisconsin: 100 μg[Ni]/L; State Drinking Water Guidelines: Arizona 150 μg[Ni]/L; Massachusetts: 100 μg[Ni]/L; Maine: 140 μg[Ni]/L; Minnesota: 100 μg[Ni]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (heptoxime) determination; or by Inductively Coupled Plasma (ICP) Optical Emission Spectrometry. This gives total nickel; dissolved nickel may be determined by the same method preceded by 0.45 μm filtration.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nickel dusts and fumes can affect you when breathed in. Can cause irritation of the eyes and skin. Skin contact may cause skin allergy, with itching, redness and later, rash. Lung allergy occasionally occurs with asthma-type effects. Fumes from heated nickel can cause pneumonia-like illness with cough and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours or days. This can cause death.

Long-Term Exposure: May cause skin and respiratory sensitization and allergy. May cause allergic asthma, pneumonitis. Breathing nickel dust and fume can cause a sore or hole in the nasal septum. May damage the kidneys and affect liver function. Nickel is a carcinogen and may damage the developing fetus. Occupational exposure to nickel refinery dust contains nickel subsulfide, and is associated with lung cancer. Handle with extreme caution.

Points of Attack: Nasal cavities, lungs, skin, liver, kidneys. *Cancer site:* lung, throat, and nasal cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite); blood plasma; end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- & postshift; sputum cytology; urine (chemical/metabolite); end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: Daily urine nickel for several days (persons with urine nickel over 100 μg need medical attention). Consider chest X-ray for acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Inhalation: Bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended by NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter).

Storage: Pyrophoric (dry nickel powder, Raney nickel, and nickel catalyst) are fire hazards. Prior to working with these chemicals, all handlers should be trained on its proper handling and storage. Finely divided nickel must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids, fluorine, ammonia, phosphorus, sulfur, selenium, hydrazine, and performic acid. Sources of ignition, such as smoking and open flames, are prohibited where pulverized nickel is handled, used, or stored. Wherever pulverized nickel is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use dry chemicals, sand, water spray or foam. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep nickel catalyst spills out of confined spaces, such as sewers, because of the possibility of an explosion or fire. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nickel dust is flammable. Use dry chemical, soda ash; or lime extinguishers. Thermal decomposition products may include metal oxides. Dry nickel catalyst may spontaneously ignite and the fire may restart after it has been extinguished. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Nickel compounds-encapsulation followed by disposal in a chemical waste landfill. However, nickel from various industrial wastes may also be recovered and recycled as described in the literature.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xi, N; risk phrases: R45; R27/28; R42/43; R50/53; R62; R63; safety phrases: S13; S22; S28; S29/35; S36/37; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Nickel ammonium sulfate is a green, odorless powder. Molecular weight = 286.93; specific gravity (H_2O:1) = 1.9. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0; reactivity 1. Soluble in water; forms an acidic solution.

Potential Exposure: This material is used in electroplating.

Incompatibilities: Forms an acidic solution with water. A weak oxidizer; keep away from combustible materials, reducing agents, including hydrides. Possible violent reaction with strong acids. Incompatible with nickel nitrate, sulfur, selenium, wood, organics, and other combustibles.

Permissible Exposure Limits in Air
NIOSH IDLH = 10 mg[Ni]/m^3
OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA
NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV[1] (*inorganic, soluble compounds*) 0.1 mg [Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.
PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter
PAC-2: 13 milligram per cubic meter
PAC-3: 79 milligram per cubic meter
DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 100 μg[Ni]/L; State Drinking Water Standards: California 100 μg[Ni]/L; Connecticut: 100 μg [Ni]/L; Delaware: 100 μg[Ni]/L; Wisconsin: 100 μg[Ni]/L; State Drinking Water Guidelines: Arizona 150 μg[Ni]/L; Massachusetts: 100 μg[Ni]/L; Maine: 140 μg[Ni]/L; Minnesota: 100 μg[Ni]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nickel ammonium sulfate can affect you when breathed in. Eye and skin contact may cause irritation and burns. Lung damage may result from a single high exposure or lower repeated exposure. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. This is sometimes delayed for 1−2 days after exposure.

Long-Term Exposure: Skin contact may cause skin allergy with itching, redness, and later, rash. Lung allergy occasionally occurs, with asthma-type effects. High or repeated lower exposures may cause scarring of the lungs, and may damage the heart, liver, or kidneys.

Points of Attack: Lungs, kidneys, heart, liver, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- & postshift; sputum cytology; urine (chemical/metabolite); end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days (person's urine nickel over 100 μg needs medical attention). Lung function tests. Consider chest X-ray following acute overexposure. Liver and kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility for medical observation up to 2 days and tests for urine nickel. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when

skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel*.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nickel ammonium sulfate must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sulfur.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of nitrogen, sulfur, metal and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Nickel carbonyl is a colorless, highly volatile, flammable liquid with a musty odor. The Odor Threshold is 1.3 ppm. It decomposes above room temperature producing carbon monoxide and finely divided nickel. Molecular weight = 170.73; specific gravity (H_2O:1) = 1.32 @ 17°C; boiling point = 42°C; freezing/melting point = -19°C; vapor pressure = 315 mmHg @ 20°C; 750 mmHg @ 42°C; Flash point < -24°C (cc); Autoignition temperature: 60°C. Explosive limits: LEL = 2%; UEL: 34%. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 3; reactivity 3. Insoluble in water.

Potential Exposure: Nickel carbonyl is used as an intermediate product in the refining of nickel. The primary use for nickel carbonyl is in the production of nickel by the Mond process. Impure nickel powder is reacted with carbon monoxide to form gaseous nickel carbonyl which is then treated to deposit high purity metallic nickel and release carbon monoxide. Other uses include gas plating; the production of nickel products; in chemical synthesis as a catalyst, particularly for oxo reactions (addition reaction of hydrogen and carbon monoxide with unsaturated hydrocarbons to form oxygen-function compounds); e.g., synthesis of acrylic esters; and as a reactant.

Incompatibilities: May spontaneously ignite on contact with air. In the presence of air, oxidizes and forms a deposit which becomes peroxidized; this tends to decompose and ignite. May explode when heated above 60°C. Decomposes on contact with acids producing carbon monoxide. Violent reaction with oxidizers; may cause fire and explosions. Vapor may promote the ignition of mixtures of combustible vapors (such as gasoline) and air. Attacks some plastics, rubber and coatings. Store under inert gas blanket.

Permissible Exposure Limits in Air

NIOSH IDLH = 2 ppm

Conversion factor: 1 ppm = 6.98 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.0001 ppm/0.007 mg[Ni]/m^3 TWA

NIOSH REL: 0.0001 ppm/0.007 mg[Ni]/m^3 TWA, potential carcinogen, limit occupational exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.05 ppm/0.12 mg[Ni]/m^3 TWA

PAC* Ver. 29[138]

PAC-1: 0.0033 ppm

PAC-2: **0.036**$_{\mathbf{A}}$ ppm

PAC-3: **0.16**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: [skin] Carcinogen Category 2

Arab Republic of Egypt: TWA 0.007 ppm (0.001 milligram per cubic meter), 1993; Australia: TWA 0.05 ppm (0.1 milligram per cubic meter), 1993; Austria: carcinogen, 1999; Belgium: carcinogen, 1993; Denmark: TWA 0.001 ppm (0.007 mg[Ni]/m^3 [skin]), 1999; Finland: TWA 0.001 ppm (0.007 milligram per cubic meter); STEL 0.003 ppm, carcinogen, 1999; France: VME 0.05 ppm (0.23 mg[Ni]/m^3), 1999; the Netherlands: MAC-TGG 0.35 milligram per cubic meter, 2003; Japan: 0.001 ppm (0.007 milligram per cubic meter), 1999; Norway: TWA 0.001 ppm (0.007 milligram per cubic meter), 1999; the Phillipines: TWA 0.001 ppm (0.007 milligram per cubic meter), 1993; Russia: TWA 0.001 ppm; STEL 0.0005 milligram per cubic meter, carcinogen, 1993; Sweden: NGV 0.001 ppm (0.007 milligram per cubic meter), carcinogen, 1999; Switzerland: MAK-W 0.05 ppm (0.35 milligram per cubic meter), [skin], carcinogen, 1999; Thailand: TWA 0.001 ppm (0.007 milligram per cubic meter), 1993; Turkey: TWA 0.001 ppm (0.007 milligram per cubic meter), 1993; United Kingdom: STEL 0.1 ppm (0.24 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.05 (Ni) ppm. The Czech Republic:[35] TWA 0.01 milligram per cubic meter; ceiling value 0.02 milligram per cubic meter. Several states have set guidelines or standards for nickel carbonyl in ambient air[60] ranging from 1.17 μ/m^3 (New York) to 1.75 μ/m^3 (Connecticut and South Carolina) to 5.0 μ/m^3 (Virginia) to 8.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #6007, Nickel carbonyl. Charcoal tube (low Ni); HNO_3; Graphite furnace atomic absorption spectrometry; NIOSH Analytical Method (IV) #6007.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 100 μg[Ni]/L; State Drinking Water Standards: California 100 μg[Ni]/L; Connecticut: 100 μg [Ni]/L; Delaware: 100 μg[Ni]/L; Wisconsin: 100 μg[Ni]/L; State Drinking Water Guidelines: Arizona 150 μg[Ni]/L; Massachusetts: 100 μg[Ni]/L; Maine: 140 μg[Ni]/L; Minnesota: 100 μg[Ni]/L.

Routes of Entry: It may be possible for appreciable amounts of the liquid to be absorbed through the skin; also ingestion and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates and burns the eyes and skin. Irritates the respiratory tract. May affect the central nervous system and the kidneys, causing tissue lesions. Medical observation is advised for 3 days or more; delayed lung effects may occur. Probable oral lethal dose for a human is between 50 and 500 mg/kg, between one teaspoon and one ounce per 150 lb person. Nickel carbonyl has also been estimated to be lethal in humans at atmospheric exposures of 30 ppm for 20 minutes. Autopsies show congestion, collapse, and tissue destruction; as well as hemorrhage in the brain. Dermatitis, recurrent asthmatic attacks; and increased number of white blood cells (eosinophils) in respiratory tract are acute health hazards. Acute exposure to nickel carbonyl may result in dizziness, giddiness, weakness, convulsions, hallucinations, delirium, nausea, vomiting, and diarrhea. Following inhalation, respiration will initially be rapid, accompanied by a nonproductive cough; and followed by pain and tightness in the chest. Pulmonary edema, cerebral edema; and hepatic (liver) degeneration may also occur. Vapor is irritating to the eyes, nose, and throat. Nickel contact dermatitis is the most common reaction to nickel carbonyl. Nickel itch may begin with a burning sensation and itching, often followed by erythema (redness) and nodular eruptions.

Long-Term Exposure: Repeated or prolonged inhalation exposure may cause skin and lung sensitization and asthma. A potential occupational carcinogen. In animals: reproductive, teratogenic effects. Permanent lung damage may occur following a single high exposure or lower repeated exposure. High or repeated exposures may cause damage to the heart muscle, liver, and/or kidney damage.

Points of Attack: Lungs, paranasal sinus, central nervous system; reproductive system; liver, kidney, heart.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; blood plasma; chest X-ray, electrocardiogram, Expired Air, 2H; pulmonary function tests; Forced Vital Capacity, Forced Expiratory Volume (1 second); sputum cytology; urinalysis (routine); white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Urine or plasma test for nickel (unexposed persons have urine levels under 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days. Lung function tests. Chest X-ray (persons with urine levels over 100 μg/L need medical observation). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is advised for 3 days or more; delayed lung effects including pulmonary edema may occur.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Nickel carbonyl must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric). Sources of ignition, such as smoking and open flames, are prohibited where nickel carbonyl is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of nickel carbonyl should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of nickel carbonyl. Wherever nickel carbonyl is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1259 Nickel carbonyl, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid, Inhalation Hazard Zone A. A United States DOT Severe Marine Pollutant.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft./m)500/150

Then: Protect persons downwind (mi/km)

Day 0.9/1.5

Night 3.1/4.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 3000/1000

Then: Protect persons downwind (mi/km)

Day 7.0 +/11.0+*

Night 7.0+/11.0+*

*+ means distance can be larger in certain atmospheric conditions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Solid streams of water may be ineffective. Material is too dangerous to health to expose fire fighters. A few whiffs of the vapor could cause death. If liquid or vapor penetrates fire fighter's protective gear it will cause fatality. Normal full protective gear available to the average fire department will not provide adequate inhalation or skin protection. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a flammable solvent. Also, nickel carbonyl used in metallizing operations may be recovered and recycled. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 100 μg[Ni]/L; State Drinking Water Standards: California 100 μg[Ni]/L; Connecticut: 100 μg [Ni]/L; Delaware: 100 μg[Ni]/L; Wisconsin: 100 μg[Ni]/L; State Drinking Water Guidelines: Arizona 150 μg[Ni]/L; Massachusetts: 100 μg[Ni]/L; Maine: 140 μg[Ni]/L; Minnesota: 100 μg[Ni]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nickel chloride can affect you when breathed in. Exposure can irritate and inflame the air passages and sinuses; causing cough, phlegm, shortness of breath; and ulceration. Contact can irritate and burn the eyes or skin.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Repeated or prolonged contact may cause skin sensitization. Repeated or prolonged inhalation exposure may cause asthma-like allergy. Once allergy develops, even low future exposures can trigger symptoms. Repeated exposure can cause lung scarring and may affect the kidneys. Nickel chloride may cause mutations. Handle with extreme caution.

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis; whole blood (chemical/metabolite);

blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- & postshift; sputum cytology; urine (chemical/metabolite); end-of-shift; white blood cell count/differential. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider lung function tests if lung symptoms are present. Kidney function tests. Chest X-ray. Daily testing for urine nickel for several days. Persons with urine nickel over 100 μg/L require immediate medical attention.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel*.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nickel chloride must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from potassium and sulfur. Mixtures of nickel chloride and potassium will produce a strong explosion on impact.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Nickel chloride itself may burn but does not easily ignite. Thermal decomposition products may include hydrogen chloride and oxides of metal and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recycle or disposal in a chemical waste landfill is recommended[22].

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazardous to aquatic life or environment, with possible long lasting effects[291,292].
Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xi; risk phrases: R49; R32; R42/43; R48/23; R50/53; safety phrases: S41; S45; S53; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]
Description: Nickel cyanide is a yellowish-brown plates or powder that may change to a green color by absorbing moisture. Odor is a weak almond odor like cyanide. Moledcular weight = 110.75; specific gravity (H_2O:1) = 2.4 @ 20°C; Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Insoluble in water.
Potential Exposure: Nickel cyanide is used in metallurgy, electroplating and making other chemicals.
Incompatibilities: Nnickel cyanide is thermally unstable and easily oxidized. Weakly basic. Liberates flammable and lethally poisonous hydrogen cyanide gas on contact with acids or acid fumes. Undergoes violent reactions with fluorine, hypochlorites, nitric acid, nitrates, nitrites. Undergoes an explosive reaction if melted with nitrites or chlorates (at about 450°C). Violent reaction with magnesium. Keep away from acids, active metals, heat, or CO_2; contact can cause release of toxic cyanide gas.
Permissible Exposure Limits in Air
NIOSH IDLH = 10 mg[Ni]/m^3
OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA
NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV[1] (*inorganic, soluble compounds*) 0.1 mg [Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.
PAC Ver. 29[138]
PAC-1: 1.1 milligram per cubic meter
PAC-2: 13 milligram per cubic meter
PAC-3: 75 milligram per cubic meter
DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1.
Russia set a MAC level of 0.005 milligram per cubic meter for nickel salts and aerosols.
as cyanides
NIOSH recommends a level of 5 milligram per cubic meter not to be exceeded during any 10-minute work period. ACGIH recommends a TWA of 5 milligram per cubic meter.
Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.
Permissible Concentration in Water: Federal Drinking Water Standards: EPA 100 μg[Ni]/L; State Drinking Water Standards: California 100 μg[Ni]/L; Connecticut: 100 μg[Ni]/L; Delaware: 100 μg[Ni]/L; Wisconsin: 100 μg [Ni]/L; State Drinking Water Guidelines: Arizona 150 μg[Ni]/L; Massachusetts: 100 μg[Ni]/L; Maine: 140 μg [Ni]/L; Minnesota: 100 μg[Ni]/L. Federal Drinking Water

Guidelines: EPA 200 μg[CN]/L; State Drinking Water Standards: California 150 μg[CN]/L; State Drinking Water Guidelines: Arizona 220 μg[CN]/L; Maine 140 μg[CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L. Consider the restrictions imposed both by nickel and by cyanide. However, the lifetime health advisories developed by EPA[49] are 154 μg/L for cyanide and 150 μg/L for nickel, which are nearly the same.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nickel cyanide can affect you when breathed in. Eye contact may cause irritation. Skin contact may cause skin allergy, with itching and redness, and later, rash. Fumes can cause pneumonia-like illness, with coughing and/or shortness of breath. Lung damage may result from a single high exposure or lower repeated exposures. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Lung allergy occasionally occurs with asthma-type effect. High or repeated lower exposures may damage the heart, liver, or kidneys.

Long-Term Exposure: Lung allergy occasionally occurs with asthma-type effect. Skin contact can cause allergy. High or repeated lower exposures may damage the lungs, with scarring of the lung tissue; and may cause damage to the heart, liver, or kidneys.

Points of Attack: Lungs, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- & postshift; sputum cytology; urine (chemical/metabolite); end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function tests, urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days (persons with urine nickel over 100 μg need medical attention). Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility for medical observation, up to 2 days and test for urine nickel. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection: *Nickel: At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter). *Cyanides: Up to 25 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nickel cyanide must be stored to avoid contact with magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids since heat and acids can release toxic cyanide.

Shipping: UN1653 Nickel cyanide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Nickel cyanide itself does not burn. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen, nickel, and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nickel hydroxide can affect you when breathed in. Irritates and burns the eyes and skin on contact. Irritates the respiratory tract causing phlegm and/or shortness of breath. Lung damage may result from a single high or lower repeated exposures. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Lung allergy occasionally occurs with asthma-type effects. High or repeated lower exposure may cause lung scarring and may damage the heart, liver, or kidneys. Skin contact may cause skin allergy, with itching, redness, and later rash. Nickel hydroxide is a carcinogen; handle with extreme caution.

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite); blood plasma; end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- & postshift; sputum cytology; urine (chemical/metabolite), end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel levels for several days (persons with urine nickel over 100 μg need medical attention). Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers away from strong acids. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nickel hydroxide is combustible but not easy to ignite. Thermal decomposition products may include oxides of nickel. Use dry chemicals, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recover and recycle where possible or dispose of in a chemical waste landfill[22].

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen (Nickel compounds and metallic nickel); IARC: (compounds) *carcinogenic to humans,* Group 1, 1997; NIOSH: Potential occupational carcinogen.

California Proposition 65 Chemical[102]: (nickel compounds) Cancer 5/7/2004

Hazard Alert: Poison, Strong oxidizer, Environmental hazard, Suspected of causing genetic defects, Suspected reprotoxic hazard.

United States National Primary Drinking Water Regulations: MCLG = 10 mg[N]/L; MCL = 10 mg[N]/L nitrate measured as Nitrogen.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as nickel compounds

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as nickel and compounds

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as nickel compounds, n.o.s.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: O, T, N, Xi; risk phrases: R45; R49; R61; R8; R20/22; R38; R41; R42/43; R48/23; R68; R50/53; safety phrases: S29/35; S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

14216-75-2

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as nickel compounds

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR401.15 Section 307 Toxic Pollutants as nickel and compounds; Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as nickel compounds, n.o.s.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: O, T, N; risk phrases: R8; R49; R61; R8; R20/22; R38; R41; R42/43; R48/23; R68; R50/53; safety phrases: S17; S41; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Nickel nitrate is a green powder. Molecular weight = 182; specific gravity (H_2O:1) = 2.1; boiling point = 137°C; freezing/melting point = 57°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 3 (oxidizer). Highly soluble in water.

Hexahydrate: Molecular weight = 290.9; specific gravity (H_2O:1) = 2.1; boiling point = 137°C; freezing/melting point = 57°C.

Potential Exposure: Nickel nitrate is used in electroplating, in nickel catalyst production for making other chemicals and the manufacture of brown ceramic colors.

Incompatibilities: A strong oxidizer. Incompatible with strong acids; sulfur, combustibles, organics, and other easily oxidizable materials. Noncombustible, but it will accelerate the burning of combustible materials. If large quantities are involved in a fire or the combustible material is finely divided, an explosion may result. Prolonged exposure to fire or heat may result in an explosion[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 10 mg[Ni]/m^3

OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA

NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1] (*inorganic, soluble compounds*) 0.1 mg [Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.

PAC Ver. 29[138]

13138-45-9

PAC-1: 0.93 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 61 milligram per cubic meter

13478-00-7, *hexahydrate*

PAC-1: 1.5 milligram per cubic meter

PAC-2: 53 milligram per cubic meter

PAC-3: 320 milligram per cubic meter

DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1

Russia set a MAC level of 0.005 milligram per cubic meter for nickel salts and aerosols.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 100 μg[Ni]/L; State Drinking Water Standards: California 100 μg[Ni]/L; Connecticut: 100 μg [Ni]/L; Delaware: 100 μg[Ni]/L; Wisconsin: 100 μg[Ni]/L; State Drinking Water Guidelines: Arizona 150 μg[Ni]/L; Massachusetts: 100 μg[Ni]/L; Maine: 140 μg[Ni]/L; Minnesota: 100 μg[Ni]/L. Safe Drinking Water Act (47FR 9352): MCLG = 10 mg[N]/L; MCL = 10 mg[N]/L nitrate measured as nitrogen.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nickel nitrate can affect you when breathed in. Irritates and burns the eyes and skin. Irritates the respiratory tract causing coughing and phlegm.

Long-Term Exposure: Skin contact may cause skin allergy with itching, redness and rash. Nickel nitrate may cause mutations. There is limited evidence that nickel nitrate may decrease fertility in males. Handle with extreme caution. Exposure may also cause lung allergy (asthma) to nickel. Once allergy asthma develops, even low future exposures can cause symptoms. Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, may die.

Symptoms include shortness of breath and blue-baby syndrome.

Points of Attack: Skin, lungs.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite); blood plasma; end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- & postshift; sputum cytology; urine (chemical/metabolite); end-of-shift; white blood cell count/differential. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider lung function tests if lung symptoms are present.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter).

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; sulfur, combustibles, organics, or other readily oxidizable materials. Avoid storage on wood floors. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2725 Nickel Nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and metal. Nickel nitrate is an oxidizer. It increases the flammability of combustible or organic substances. Extinguish fire using an agent suitable for type of surrounding fire. Nickel nitrate itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long lasting effects[191,192].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xn, Xi; risk phrases: R45; R22; R36/37/38; R40; R42/43; R50/53; R62; R63; safety phrases: S16; S22; S23; S26; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Nickel sulfate is a blue to blue-green crystalline solid. It has a sweet taste (do not test). Molecular weight = 154.76; specific gravity (H_2O:1) = 4.01; boiling point = 103°C; freezing/melting point = (decomposes) 848°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0; (hexahysrate) Health 3, flammability 0; reactivity 0. Soluble in water.

Hexahydrate: Molecular weight = 262.9; specific gravity (H_2O:1) = 2.03.

Potential Exposure: Nickel sulfate is used in plating baths, and as an intermediate in the production of nickel ammonium sulfate; as a mordant in dyeing, and printing textiles; coatings, and ceramics.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. The aqueous solution is a weak acid. Sulfates may react violently with aluminum, magnesium.

Permissible Exposure Limits in Air

NIOSH IDLH = 10 mg[Ni]/m^3

OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA

NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 100 μg[Ni]/L; State Drinking Water Standards: California 100 μg[Ni]/L; Connecticut: 100 μg [Ni]/L; Delaware: 100 μg[Ni]/L; Wisconsin: 100 μg[Ni]/L; State Drinking Water Guidelines: Arizona 150 μg[Ni]/L; Massachusetts: 100 μg[Ni]/L; Maine: 140 μg[Ni]/L; Minnesota: 100 μg[Ni]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nickel sulfate can affect you when breathed in. It may also cause infertility in males. High or repeated exposures can scar the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy, with itching, redness, and later rash. Repeated or prolonged inhalation exposure may cause asthma-like lung allergy. Lungs may be scarred by repeated or prolonged exposure to the aerosol. Nickel sulfate may cause mutations. Handle with extreme caution. Carcinogenic to humans. Animal tests show that this substance possibly causes toxic effects upon human reproduction. May cause kidney damage.

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite); blood plasma; end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- & postshift; sputum cytology; urine (chemical/metabolite); end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function test. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days (persons with urine nickel over 100 μg/L need medical attention). Lung function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel*.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nickel sulfate must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); wood, and other combustibles, since violent reactions occur. A regulated, marked area should be established where nickel sulfate is handled, used or stored.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nickel sulfate is not flammable. Thermal decomposition products may include oxides of sulfur and metal. Use agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans.

Description: White crystalline solid or powder. Phenolic odor. Molecular weight = 410.41; specific gravity (H_2O:1) = 1.45 @20°C; boiling point = (decomposes) 165°C; freezing/melting point = 141-144°C; 172°C; Henry's Law constant = 4.13 × 10^{-18} atm-m^3/mol @ 25°C[83,USDA]. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0. Highly soluble in water; solubility = 0.25 g/L @ 25°C; 1.2 × 10^4 mg/L @ 25°C[83,USDA].

Potential Exposure: Nicosulfuron is a sulfonylurea post-emergence herbicide used to control a variety of weeds on field corn and popcorn crops. Some formulations may be registered as United States Restricted Use Pesticides (RUP)

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. Decomposed >165°C.

Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <1.0$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, dermal contact, ingestion

Harmful Effects and Symptoms

Human health effects from the sulfonylurea herbicides at low environmental doses or at biomonitored levels from low environmental exposures are unknown. The sulfonylurea herbicides are generally of low toxicity in mammalian studies. Animal studies showed low acute toxicity and little chronic, reproductive, or developmental toxicity or teratogenic effects. Developmental or teratogenic effects tended only to occur at high or maternally toxic doses. At high sublethal, chronic oral doses, such nonspecific effects as weight loss and anemia were observed. Some chemical-specific effects were noted at high doses in animals[96].

Short-Term Exposure: May cause skin, eye and respiratory tract irritation. Moderately poisonous if ingested or inhaled. LD_{50} (oral, rat) = >5 g/kg; LD_{50} (dermal, rat) = >2 g/kg.

Medical Surveillance: Urinary levels of the sulfonylurea herbicides reflect recent exposure. There is very limited information on the biomonitoring of sulfonylurea herbicides or their metabolites. Detection of the metabolites may reflect exposure to more than one particular sulfonylurea herbicide or from exposure to environmental degradation products. The urinary metabolites dimethoxypyrimidine and dimethylpyrimidine can be used as nonspecific markers of exposure to the pyrimidinylsulfonylureas, a group that includes bensulfuron-methyl, halosulfuron, primisulfuron-methyl, and sulfosulfon. The urinary metabolite methoxymethyl triazine can be used as a nonspecific marker of exposure to the triazinylsulfonylureas, a group that includes chlorosulfuron, prosulfuron, and triasulfuron[96].

Harmful Effects and Symptoms

Human health effects from the sulfonylurea herbicides at low environmental doses or at biomonitored levels from low environmental exposures are unknown. The sulfonylurea herbicides are generally of low toxicity in mammalian studies. Animal studies showed low acute toxicity and little chronic, reproductive, or developmental toxicity or teratogenic effects. Developmental or teratogenic effects tended only to occur at high or maternally toxic doses. At high sublethal, chronic oral doses, such nonspecific effects as weight loss and anemia were observed. Some chemical-specific effects were noted at high doses in animals[96].

Short-Term Exposure: May cause skin and eye irritation. Moderately poisonous if ingested or inhaled. LD_{50} (oral, rat) = >5 g/kg; (dermal, rat) = >2 g/kg.

Long-Term Exposure: Prolonged or repeated contact can cause chronic injury. See below:

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Urinary levels of the sulfonylurea herbicides reflect recent exposure. There is very limited information on the biomonitoring of sulfonylurea herbicides or their metabolites. Detection of the metabolites may reflect exposure to more than one particular sulfonylurea herbicide or from exposure to environmental degradation products. The urinary metabolites dimethoxypyrimidine and dimethylpyrimidine can be used as nonspecific markers of exposure to the pyrimidinylsulfonylureas, a group that includes bensulfuron-methyl, halosulfuron, primisulfuron-methyl, and sulfosulfon. The urinary metabolite methoxymethyl triazine can be used as a nonspecific marker of exposure to the triazinylsulfonylureas, a group that includes chlorosulfuron, prosulfuron, and triasulfuron[96].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 or UN3082 Environmentally hazardous substances, liquid or solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include fluorine and nitrogen oxides. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft. for liquids and at least 25 m/75 ft. for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Nicotine is a pale yellow to dark brown, oily liquid. Slight, fishy or pyridine-like odor when warm. It is also available as a powder. Molecular weight = 162.23; specific gravity (H_2O:1) = 1.01; boiling point = 250°C; freezing/melting point = −78.9°C; vapor pressure = 0.08 mmHg @ 20°C; flash point = 95°C (cc); autoignition temperature = 240°C. Explosive limits: LEL = 0.7%; UEL: 4.0%. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 1; reactivity 0. Slightly soluble in water.

Potential Exposure: An alkaloid produced from tobacco. Nicotine is used in some drugs; and in tanning. At one time, nicotine was used in the United States as an insecticide and fumigant; however, it is no longer produced or used in the United States for this purpose.

Incompatibilities: Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with strong acids. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 milligram per cubic meter

OSHA PEL: 0.5 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA [skin]

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 3.5 milligram per cubic meter

PAC-3: 35 milligram per cubic meter

DFG MAK: [skin]

Arab Republic of Egypt: TWA 0.5 milligram per cubic meter [skin], 1993; Australia: TWA 0.5 milligram per cubic meter [skin], 1993; Austria: MAK 0.07 ppm, 1999; Belgium: TWA 0.5 milligram per cubic meter [skin], 1993; Denmark: TWA 0.5 milligram per cubic meter [skin], 1999; Finland: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter [skin], 1999; France: VME 0.5 milligram per cubic meter [skin], 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter [skin], 2003; Norway: TWA 0.5 milligram per cubic meter, 1999; the Phillipines: TWA 0.5 milligram per cubic meter [skin], 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Switzerland: MAK-W 0.07 ppm (0.5 milligram per cubic meter), KZG-W 0.14 ppm [skin], 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 milligram per cubic meter [skin], 1993; United Kingdom: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 milligram per cubic meter [skin]. Several states have set guidelines or standards for nicotine in ambient air[60] ranging from 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2544, #2551.

Determination in Water: Hazardous to the aquatic environment. Octanol−water coefficient: Log K_{ow} = 1.2. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Nicotine affects the nervous system and the heart. Exposure to relatively small amounts can rapidly be fatal [77].

Short-Term Exposure: Irritates the eyes and skin. Even small exposures can cause increased heart rate; increased blood fat levels; and change vital hormone levels. May affect the cardiovascular system and central nervous system; resulting in convulsions and respiratory failure. Nicotine is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg or a taste (less than 7 drops) for a 70 kg (150 lb) person. It may be assumed that ingestion of 40−60 mg of nicotine is lethal to humans. There is a fundamental difference between acute toxicity from use of nicotine as an insecticide instead of from ingestion; and chronic toxicity that may be caused by prolonged exposure to small doses as occurs in smoking. Maternal smoking during pregnancy is associated with increased risk of spontaneous abortion, low birth weight and still-birth. Acute exposure to nicotine may result in headache, dizziness, confusion, agitation, restlessness, lethargy, seizures, and coma. Victims may experience hypertension (high blood pressure), tachycardia (rapid heart rate), and tachypnea (rapid respirations), followed by hypotension (low blood pressure), bradycardia (slow heart rate), and respiratory depression. Cardiac arrhythmias may also occur. Gastrointestinal effects include nausea, vomiting, abdominal pain or burning sensation; and diarrhea. Increased salivation, lacrimation (tearing), and sweating may be noted. High levels, far above the OEL, may result in death.

Determination in Water: Octanol−water coefficient: Log K_{ow} = <1.2. Unlikely to bioaccumulate in marine organisms.

Long-Term Exposure: Animal tests show that this substance possibly causes toxic effects upon human reproduction. Nicotine was found as a cocarcinogen in animals.

Points of Attack: Central nervous system; cardiovascular system; lungs, GI tract; reproduction system. Has been shown to be a teratogen in animals; may be a teratogen in humans. Causes fat deposits in the arteries (reducing blood supply to many body organs). This increases the risk of heart attack, stroke, and many other poor circulation problems. Chronic high blood pressure can also result.

Medical Surveillance: NIOSH lists the following tests: blood plasma, during exposure; pre- and postshift; urine (chemical/metabolite). Before beginning employment and at regular times after that, the following is recommended: blood test for nicotine (only accurate shortly after exposure); consider test to evaluate typical exposures as well as for suspected overexposure or if symptoms are present. Even those who have smoked for a long time can reduce the risk of developing health problems by stopping.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

possibility of skin contact. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Nicotine must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1654 Nicotine, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nicotine is a combustible liquid. Extinguish with foam, dry chemical, or carbon dioxide extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. Water may cause frothing if it gets below surface of liquid and turns to steam. However, water fog gently applied to surface will cause frothing which will extinguish the fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R26/27/28; R34; R36/37/38; R50/53; R61; R62; safety phrases: S1/2; S13; S16; S26; S28; S29; S36/37/39; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: Nicotine sulfate is a white crystalline solid. Molecular weight = 420.58; autoignition temperature = 244°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 1; reactivity 0. Soluble in water.
Potential Exposure: Nicotine sulfate is used as an insecticide and in veterinary medicine as an anthelmintic and external parasiticide. An alkaloid produced from tobacco.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 0.82 milligram per cubic meter
PAC-2: 9 milligram per cubic meter
PAC-3: 18 milligram per cubic meter
Russia set a MAC in ambient air in residential areas of 0.005 milligram per cubic meter on a once-daily basis and 0.001 milligram per cubic meter on a daily average basis.
Routes of Entry: Inhalation, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: The liquid irritates the eyes and skin. Inhalation irritates nose and throat. May affect the central nervous system; causing convulsions and respiratory failure. Exposure at high concentrations may result in death. Onset of acute poisoning is rapid. Symptoms include nausea, salivation, abdominal pain; vomiting, diarrhea, cold sweat; headache, dizziness, disturbed hearing and vision; mental confusion; marked weakness; faintness and prostration, lowered blood pressure; difficult breathing; and weak, rapid and irregular pulse. It is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg (less than 7 drops) for a 70 kg (150 lb) person. Death is possible from respiratory failure caused by paralysis of the respiratory muscles.
Long-Term Exposure: Animal tests show that this substance possibly causes toxic effects upon human reproduction.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1658 Nicotine sulfate solution, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Solution: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. To clean up, do not touch spilled material; stop leak if possible. Use water spray to reduce vapors. *Small spills*: Take up with sand or other noncombustible absorbent material and place into containers for disposal. Small dry spills with clean shovel place material into clean, dry container, and cover; move containers from spill area. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. As for nicotine, extinguish with alcohol foam, dry chemical, or carbon dioxide. Large fires can be extinguished with water spray, fog, or foam. Wear positive pressure breathing apparatus and special protective clothing. Dike fire control water; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Nitric acid is a colorless to light brown fuming liquid with an acrid, suffocating odor. Fuming nitric acid is a reddish fuming liquid. Fumes in moist air. Often used in an aqueous solution. Fuming nitric acid is concentrated nitric acid that contains dissolved nitrogen dioxide. Nitric acid is a solution of nitrogen dioxide, NO_2, in water and so-called fuming nitric acid contains an excess of NO_2 and is yellow to brownish-red in color. Molecular weight = 63.02; specific gravity (H_2O:1) = 1.50 @ 25°C; boiling point = 82.8°C; freezing/melting point = −42°C (monohydrate); −19°C (trihydrate); vapor pressure = 48 mmHg. Soluble in water.

Potential Exposure: Nitric acid is the second most important industrial acid and its production represents the sixth largest chemical industry in the United States. Nitric acid is used in chemicals, explosives, fertilizers, steel pickling; metal cleaning. The largest use of nitric acid is in the production of fertilizers. Almost 15% of the production goes into the manufacture of explosives, with the remaining 10% distributed among a variety of uses, such as etching, bright-dipping; electroplating, photoengraving, production of rocket fuel; and pesticide manufacture.

Incompatibilities: A strong oxidizer and strong acid. Reacts violently with combustible and reducing agents; carbides, hydrogen sulfide, turpentine, charcoal, alcohol, powdered metals; strong bases. Heat causes decomposition producing nitrogen oxides. Attacks some plastics. Corrosive to metals.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 ppm

Conversion factor: 1 ppm = 2.58 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 2 ppm/5 milligram per cubic meter TWA

NIOSH REL: 2 ppm/5 milligram per cubic meter TWA; 4 ppm/10 milligram per cubic meter STEL

ACGIH TLV[1]: 2 ppm/5.2 milligram per cubic meter TWA; 4 ppm/10 milligram per cubic meter STEL

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.16}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{24}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{92}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values. DFG MAK: 2 ppm/5.2 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D

Arab Republic of Egypt: TWA 2 ppm (5 milligram per cubic meter), 1993; Australia: TWA 2 ppm (5 milligram per cubic meter); STEL 4 ppm, 1993; Austria: MAK 2 ppm (5 milligram per cubic meter), 1999; Belgium: TWA 2 ppm (5.2 milligram per cubic meter); STEL 4 ppm (10 milligram per cubic meter), 1993; Denmark: TWA 2 ppm (5 milligram per cubic meter), 1999; Finland: TWA 2 ppm (5 milligram per cubic meter); STEL 5 ppm (13 milligram per cubic meter) [skin], 1999; France: VME 2 ppm (5 milligram per cubic meter), VLE 5 ppm (10 milligram per cubic meter), 1999; Hungary: STEL 5 milligram per cubic meter, 1993; Japan: 2 ppm (5.2 milligram per cubic meter), 1999; Norway: TWA 2 ppm (5 milligram per cubic meter), 1999; the Phillipines: TWA 2 ppm (5 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 10 milligram per cubic meter, 1999; Russia: TWA 2 ppm; STEL 2 milligram per cubic meter [skin], 1993; Sweden: NGV 2 ppm (5 milligram per cubic meter), KTV 5 ppm (13 milligram per cubic meter), 1999; Thailand: TWA 2 ppm (5 milligram per cubic meter), 1993; Turkey: TWA 2 ppm (5 milligram per cubic meter), 1993; United Kingdom: LTEL 2 ppm (5 milligram per cubic meter); STEL 4 ppm (10 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 4 ppm. Russia set a MAC for nitric acid in ambient air in residential areas of 0.4 milligram per cubic meter on a once-daily basis and 0.15 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for nitric acid in ambient air[60] ranging from 50−100 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut, Florida, New York, and South Dakota) to 119 μ/m^3 (Nevada) to 125 μ/m^3 (South Carolina) to 1000 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #7903, acids, inorganic; OSHA Analytical Methods ID-127 and ID-165SG.

Permissible Concentration in Water: The EEC set a MAC in drinking water of 50 mg NO_3/liter and a guideline level of 25 mg NO_3/liter[35]. Russia[43] set a MAC of 0.4 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Corrosive if ingested. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. This compound is a Primary irritant (w/o allergic reaction), and causes burns and ulceration of all tissues and membranes that it contacts. This includes burns to the eyes and skin by contact; burns to the mouth, throat, esophagus, and stomach by ingestion; and the entire respiratory tract by inhalation. Circulatory collapse and shock is often the immediate cause of death. The approximate minimum lethal dose is 5 ml for a 150 lb person. Persons with skin, eye, or cardiopulmonary disorders are at a greater risk. Signs and symptoms of acute ingestion of nitric acid may be severe and include increased salivation; intense thirst; difficulty in swallowing; chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of nitric acid. Acute inhalation exposure may result in sneezing, hoarseness, choking, laryngitis, dyspnea (shortness of breath), respiratory tact irritation; and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa; chronic bronchitis; and pneumonia may also occur. If the eyes have come in contact with nitric acid, irritation, pain, swelling, corneal erosion; and blindness may occur. Dermal exposure may result in severe burns, pain, and dermatitis (red, inflamed skin).

Long-Term Exposure: The mists or vapors may cause erosion of the teeth. May affect the lungs.

Points of Attack: Eyes, skin, respiratory system; teeth.

Medical Surveillance: NIOSH recommends that workers subject to nitric acid exposure have comprehensive preplacement and annual medical examinations including a 14″ × 17″ posterior-anterior chest X-ray, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); and a visual examination of the teeth for evidence of dental erosion.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitric acid: Neoprene (up to 30%); Natural rubber or polyvinyl chloride (up to 70%); Neoprene/natural rubber or Saranex (more than 70%). For fuming nitric acid the following are recommended: Viton, nitrile, Neoprene, natural rubber, chlorobutyl, or Neoprene/natural rubber. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. possibility of skin contact with liquids of pH < 2.5 or repeated or prolonged contact with liquids of pH > 2.5. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash if liquids of pH < 2.5 are involved.

Respirator Selection: *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); orCcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:SCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection. Only nonoxidizable sorbents are allowed (not charcoal).

Storage: Store nitric acid separately from acetic acid. Storage in another isolated location and/or in the shipping container, usually Styrofoam, is preferred.

(1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nitric acid must be stored to avoid contact with metallic powders, carbides, hydrogen sulfide; turpentine, or strong bases because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Heat may cause containers to burst and result in an escape of poisonous gases. Fuming nitric acid should be avoided.

Shipping: UN2031 Nitric acid other than red fuming, with >70% nitric acid or Nitric acid other than red fuming, with at least 65%, but not >70% nitric acid, Hazard Class: 8; Labels: 8-Corrosive material, 5.1-Oxidizer. UN2032 Nitric acid, red fuming, Hazard Class: 8; Labels: 8-Corrosive material, 5.1-Oxidizer, 6.1-Poisonous material. Inhalation, Hazard Zone B. UN2031 Nitric acid other than red fuming, with >20% and <65% nitric acid or Nitric acid other than red fuming, with not >20% nitric acid, Hazard Class: 8; Labels: 8-Corrosive material.

Spill Handling:

UN2032 Nitric acid, red fuming

Initial isolation and protective action distances (UN2032 fuming nitric acid)

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

Nitric acid, fuming and red fuming

First: Isolate in all directions (ft./m)100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 0.7/1.2

Keep unnecessary people away. Do not touch spilled material; stop leak if you can do so without risk. Isolate the hazard area and deny entry. Stay upwind and keep out of low areas. Ventilate closed spaces before entering them. Ventilate area of spill or leak. Remove all ignition sources. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Use water spray to reduce vapors; do not get water inside container. *Small spills*: flush area with flooding amounts of water. *Large spills*: dike far ahead of spill for later disposal. Flush with copious quantities of water and neutralize with alkaline material (such as soda ash, lime, etc.). Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Nitric acid is noncombustible. However, it can increase the flammability of combustible, organic, and readily oxidizable materials, or even cause ignition of some of these with water. Thermal decomposition products may include nitrogen oxides. Use water spray. *Small fires:* water, dry chemical, or soda ash. *Large fires:* flood fire area with water. Move container from fire area if you can do so without risk. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Soda ash-slaked lime is added to form the neutral solution of nitrate of sodium and calcium. This solution can be discharged after dilution with water[22]. Also, nitric acid can be recovered and reused in some cases as with acrylic fiber spin solutions. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with

EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Nitric oxide is a colorless gas with a sharp, sweet odor; brown at high concentration in air. Shipped as a nonliquefied compressed gas. Molecular weight = 30.01; specific gravity (H_2O:1) = 1.22 @ 20°C; boiling point = −151.7°C; freezing/melting point = −163.3°C; Relative vapor density (air = 1) = 1.04; vapor pressure = 750 mmHg @ −152°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0 ₩, oxidizer. Slightly soluble in water; solubility = 5%. The liquid is very sensitive to detonation in the presence of water[101].

Potential Exposure: Nitric oxide is used in the manufacture of nitric acid; it is also used in the bleaching of rayon; it is a raw material for nitrosyl halide preparation.

Incompatibilities: A strong oxidizer but may also act as a reducing agent[101]. Explosive reaction with nitrogen trichloride, ozone, carbon disulfide; pentacarbonyl iron; chlorine monoxide. Incompatible with halogens, combustibles, metals, oil, alcohols, chlorinated hydrocarbons (e.g., trichloroethylene), reducing agents (such as NH_3), oxygen, fluorine, metals. Reacts with water to form nitric acid. Rapidly converted in air to nitrogen dioxide. Combines very rapidly with oxygen in the air to form nitrogen dioxide. Nitrogen dioxide reacts with water to form nitric acid and nitric oxide, reacts with alkalis to form nitrates and nitrites[206,136].

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 1.88 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 0.3–1.0 ppm.

OSHA PEL: 25 ppm/30 milligram per cubic meter TWA

Austria: MAK 25 ppm (30 milligram per cubic meter), 1999; Denmark: TWA 25 ppm (30 milligram per cubic meter), 1999; France: VME 25 ppm (30 milligram per cubic meter), 1999; Norway: TWA 25 ppm (30 milligram per cubic meter), 1999;

Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 10 milligram per cubic meter, 1999; Sweden: NGV 25 ppm (30 milligram per cubic meter), KTV 50 ppm (60 milligram per cubic meter), 1999; Thailand: TWA 25 ppm (30 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 30 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 25 ppm. Several states have set guidelines or standards for nitric oxide in ambient air[60] ranging from 0.3 milligram per cubic meter (North Dakota) to 0.5 milligram per cubic meter (Virginia) to 0.6 milligram per cubic meter (Connecticut) to 0.714 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6014, Nitric oxide and nitrogen dioxide, 6014; OSHA Analytical Method #ID-109.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin. Strong respiratory tract irritant. High levels can interfere with the blood's ability to carry oxygen (methemoglobinemia). Nitric oxide forms acids in the respiratory system which are irritating and can cause congestion in the lungs or pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Nitric oxide can cause death or permanent injury after a very short exposure to small quantities. Can cause unconsciousness. Concentrations of 60-150 ppm cause immediate irritation of the nose and throat with coughing and burning in the throat and chest 6−24 hours after exposure; labored breathing and unconsciousness may result. Concentrations of 100−150 ppm are dangerous for a short exposure of 30−60 minutes. Concentrations of 200−700 ppm may be fatal after very short exposure. Nitric oxide can cause death due to blockage of gas exchange in lungs. Initially, symptoms include slight coughing, fatigue and nausea at high concentrations; coughing, choking, headache, nausea, abdominal pain; and shortness of breath are seen. Latent symptoms are uneasiness, restlessness, rapid and shallow breathing; bluing of skin, lips and fingernail beds; anxiety, mental confusion; and finally loss of consciousness.

Long-Term Exposure: Can irritate the lungs; bronchitis may develop. Can cause headache, nausea, vomiting, fatigue, mental confusion; unconsciousness, and death. Increased blood methemoglobin levels.

Points of Attack: Eyes, skin, respiratory system; blood, central nervous system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, on workers over 40 years, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second). Consider the points of attack in preplacement and periodic physical examinations. Blood methemoglobin levels.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact resistant, gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. pressure, pressure-demand, full facepiece SCBA (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical resistant suit.

Respirator Selection: NIOSH/OSH: *1000* ppm*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFS (APF = 50) (any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern); or PaprS (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern); or GmFS (APF = 50) (any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern); or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:*

GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Only nonoxidizable sorbents are allowed (not charcoal).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow Stripe: Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (3) Prior to working with this chemical, personnel should be trained on its proper handling and storage. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1660/124 Nitric oxide, compressed, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Un1660 nitric oxide or nitric oxide, compressed

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft./m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.5/2.4

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nitric oxide itself does not burn. It will react with water or steam to produce heat and corrosive fumes. Thermal decomposition products may include nitrogen oxides. This gas is under pressure; containers may rupture and explode when heated. May ignite other combustible materials (wood, paper, oil, etc.). Mixture with fuels may explode. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapor explosion and poison hazard indoors, outdoors or in sewers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration with added hydrocarbon fuel, controlled so as to produce elemental nitrogen, CO_2, and water. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 205-355-7

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1999; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat. United States Environmental Protection Agency Gene-Tox Program, Positive: Carcinogenicity-mouse/rat; Negative: D *melanogaster* sex-linked lethal.

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected reprotoxic hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazard symbols, risk; & safety statements: Hazard symbol: T, Xn; risk phrases: R45; R20/21/22; R36/37/38; R34; R40; R63; safety phrases: S22; S26; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Nitrilotriacetic acid is a crystalline compound. Molecular weight = 191.16; boiling point = 167°C; freezing/melting point = 242°C (decomposition). Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0. Slightly soluble in water.

Potential Exposure: Nitrilotriacetic acid (NTA) was used as a phosphate replacement in laundry detergents in the late 1960s. In 1971, the use of NTA was discontinued. The possibility of resumed use arose in 1980. NTA is now used in laundry detergents in states where phosphates are banned. NTA is also used as a boiler feed-water additive at a maximum use level of 5 ppm of trisodium salt. Currently, the remaining nondetergent uses of NTA are for water treatment, textile treatment; metal plating and cleaning; and pulp and paper processing.

Incompatibilities: Dust may form explosive mixture with air. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Attacks aluminum, copper, copper alloy and nickel.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 4.4 milligram per cubic meter

PAC-2: 49 milligram per cubic meter

PAC-3: 290 milligram per cubic meter

DFG MAK: avoid simultaneous exposure to Iron (Fe) compounds.

Permissible Concentration in Water: No criteria set for drinking water; NTA addition to boiler feed-water is limited to 5 ppm by FDA. NTA levels in the United States drinking water prior to NTA's discontinued use in detergents was estimated by EPA to have ranged from 0.20−24.5 μg/L. NTA is rapidly degraded under aerobic conditions at temperatures above 5°C, and biodegradation does not lead to the formation of persistent intermediates.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < -3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. This material is moderately toxic; harmful when ingested. The LD_{50}-oral-rat is 1470 mg/kg.

Long-Term Exposure: Possibly carcinogenic. Possible kidney damage.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid dust. Or, use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

CAS Registry Number: 602-87-9

HSDB Number: 4092

RTECS Number: AB1060000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 210-025-0 [*Annex I Index No.:* 609-037-00-2]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987. NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat, 1987.

California Proposition 65 Chemical[102]: Cancer 4/1/1988.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R45; R50; R62; safety phrases: S1; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 5-Nitroacenaphthene is a yellow crystalline solid. Molecular weight = 199.22; freezing/melting point = 103-104°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 1; reactivity 0.

Potential Exposure: Used in organic synthesis.

Incompatibilities: 5-Nitroacenaphthene is an aromatic hydrocarbon (nitro compound). It may be flammable or explosive. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides; alkalis may increases the thermal sensitivity of this chemical.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: Carcinogen Category 2

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: May reduce the blood's ability to carry oxygen (methhemoglobinemia) with cyanosis, fatigue, dizziness, headache. May affect the central nervous system.

Long-Term Exposure: Little is known aside from the fact that it is a carcinogen. May cause liver and kidney damage. Poisoning may cause anemia, cyanosis, fatigue, insomnia, weight loss.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon, Silvershield, Viton, Viton/chlorobutyl rubber, chlorinated polyethylene; and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with acetone. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Careful incineration in an incinerator equipped with afterburner and scrubbers[22].

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

European/International Regulations (*all isomers*): Hazard symbol: T, N; risk phrases: R23/24/25; R33; R51/53; R61; R62; R63; safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *p*-Nitroaniline consists of yellow crystals with a pungent, faint ammonia-like odor. Molecular weight = 138.12; specific gravity (H_2O:1) = 1.42 @ 20°C; boiling point = 332°C; freezing/elting point = 148°C; vapor pressure = 0.000002 mmHg @ 20°C; Flash point = 198.9°C; Autoignition temperature = 510°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0. Slightly soluble in water.

Potential Exposure: *p*-Nitroaniline is used as an intermediate in the manufacture of dyes; antioxidants, pharmaceuticals, and pesticides.

Incompatibilities: A combustible liquid. A strong oxidizer. Incompatible with strong acids; sulfur, combustibles, organics, and other easily oxidizable materials. Will accelerate the burning of combustible materials. If large quantities are involved in a fire or the combustible material is finely divided, an explosion may result. Prolonged exposure to fire or heat may result in an explosion[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 300 milligram per cubic meter

OSHA PEL: 1 ppm/6 milligram per cubic meter TWA [skin]

NIOSH REL: 3 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 3 milligram per cubic meter TWA [skin]; not classifiable as a human carcinogen; BEIM issued for Methemoglobin inducers.

DFG MAK: [skin]; Carcinogen Category 3A

PAC Ver. 29[138]

PAC-1: 9 milligram per cubic meter

PAC-2: 71 milligram per cubic meter

PAC-3: 300 milligram per cubic meter

Arab Republic of Egypt: TWA 1 ppm (6 milligram per cubic meter) [skin], 1993; Australia: TWA 3 milligram per cubic meter [skin], 1993; Austria: MAK 1 ppm (6 milligram per cubic meter) [skin], 1999; Belgium: TWA 3 milligram per cubic meter [skin], 1993; Denmark: TWA 0.5 ppm (3 milligram per cubic meter) [skin], 1999; Finland: TWA 1 ppm (6 milligram per cubic meter); STEL 3 ppm (18 milligram per cubic meter) [skin], 1993; France: VME 3 milligram per cubic meter [skin], 1999; the Netherlands: MAC-TGG 6 milligram per cubic meter, [skin], 2003; Japan: 3 milligram per cubic meter [skin], 1999; Norway: TWA 1 milligram per cubic meter, 1999; the Phillipines: TWA 1 ppm (6 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 3 milligram per cubic meter; MAC (STEL) 10 milligram per cubic meter, 1999; Russia: STEL 0.1 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 0.5 ppm (3 milligram per cubic meter) [skin], 1999; Turkey: TWA 1 ppm (6 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 6 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for *p*-nitroaniline in ambient air[60] ranging from zero (Connecticut) to 6.0 μ/m^3 (New York) to 7.143 μ/m^3 (Kansas) to 15 μ/m^3 (South Carolina) to 30 μ/m^3 (Florida and North Dakota) to 50 μ/m^3 (Virginia) to 71 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5033.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 2.7. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *p*-Nitroaniline can affect you when breathed in and by passing through your skin. Exposure by skin contact or breathing can interfere with the ability of the blood to carry oxygen (metheglobinemia) and kidney impairment. This can cause headaches, dizziness, cyanosis (a Blue color to the skin and lips), trouble breathing and even collapse and death.

Long-Term Exposure: Because this is a potential mutagen, handle it as a possible cancer-causing substance-with extreme caution. May affect the blood, causing the forming of methemoglobin, low blood count (anemia), kidney and liver damage. People with "G-6-P-D Deficiency" may be at higher risk for developing health problems following exposure.

Points of Attack: Respiratory system, blood, heart, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Methhemoglobin; CBC; liver function tests. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: kidney function tests. Also, tests for the condition called "G-6-P-D Deficiency."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 30 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator).* *Up to 75 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 150 milligram per cubic meter:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 300 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp; ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv100 [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. *p*-Nitroaniline must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); reducers and strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Wherever *p*-nitroaniline is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1661 Nitroanilines (*m-, o-, p-*), Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include sulfur dioxide and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 seconds minimum) with scrubbing for nitrogen oxides abatement. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence; Human No Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat, 1978. 5-Nitro-*o*-anisidine was removed from the NTP 6th Report on Carcinogens as a substance "reasonably anticipated to be a human carcinogen" in 1991, when NTP concluded there was insufficient evidence of carcinogenicity. California Proposition 65 Chemical[102]: Cancer delisted 12/8/2006

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects,

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R20/21/22; R27/28; R36/37/38; R46; R51; R62; safety phrases: S13; S22; S36/37/39; S45; S53; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: 5-Nitro-*o*-anisidine is an orange-red crystalline compound. Molecular weight = 168.17; freezing/melting point = 118°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0.

Potential Exposure: 5-Nitro-*o*-anisidine is a chemical intermediate in the production of C.I. Pigment red 23, which is used as a colorant for commodities, such as printing inks, interior latex paints; lacquers, rubber, plastics, floor coverings; paper coating; and textiles. It is also used with other C.I. coupling components to produce various hues of red, brown, yellow, and violet on cotton, silk, acetate and nylon.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid chlorides; acid anhydrides; chloroformates.

Permissible Exposure Limits in Air No OELs have been established, but this chemical can be absorbed through the skin. Several states have set guidelines or standards for 5-nitro-*o*-ansidine in ambient air[60] ranging from zero (North Dakota) to 0.08 μ/m^3 (Rhode Island).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: High levels can interfere with the blood's ability to carry oxygen (methemoglobinemia) causing dizziness, cyanosis. Higher levels can cause trouble breathing; collapse, and even death.

Long-Term Exposure: This compound is a proved carcinogen in experimental animals. Related chemicals can cause allergic skin rash, and irritate the nose, throat, and lungs. It is not known whether this substance can cause these effects.

Points of Attack: Blood. *Cancer site:* bladder.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Blood hemoglobin level, CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; acid chlorides; acid anhydrides; and chloroformates. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 seconds minimum) with scrubbing for nitrogen oxides abatement.

EC Number: 202-052-1 [609-047-00-7]

Regulatory Authority and Advisory Information

Carcinogenicity: (91-23-6) NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B. California Proposition 65 Chemical[102]: Cancer, 10/1/1990

Hazard Alert: Poison, (91-23-6): Poison, Combustible, Strong oxidizer; Possible risk of forming tumors, Suspected of causing genetic defects.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations (91-23-6): Hazard symbol: T, O; risk phrases: R45; R8; R22; R45; R50/53; R62; safety phrases: S17; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 2-Nitroanisole is a yellowish or light-red to amber liquid. May be transported in molten form. Molecular weight = 153.15; specific gravity (H_2O:1) = 1.254 @ 20°C; boiling point = 271°C @ 760 mmHg; freezing/melting point = 9.4-10.5°C; vapor pressure = 4×10^{-3} mmHg @ 25°C; Henry's Law constant = 4.29×10^{-7} atm-m^3/mol @ 25°C (est)[72]; flash point = >110°C; 142°C; autoignition temperature = 464°C. Practically insoluble in water; solubility = <1 mg/mL @ 24°C.

Potential Exposure: A dye intermediate and for synthesis of other chemicals. NFPA has reported an explosion on during reduction with a nickel catalyst. Occupational exposure to 2-nitroanisole may occur through inhalation and dermal contact with this compound at workplaces where the chemical is produced or used.

Incompatibilities: A strong oxidizer. Incompatible with strong acids; sulfur, combustibles, organics, and other easily oxidizable materials. Will accelerate the burning of combustible materials. If large quantities are involved in a fire or the combustible material is finely divided, an explosion may result. Prolonged exposure to fire or heat may result in an explosion[101]. Explodes at temperatures >110°C. Combustible-liquid or fine powder may form explosive mixture with air. Nitroanisole reacts explosively with (sodium hydroxide + zinc). It reacts vigorously with hydrogen + catalyst (@ 250°C & 25,500 mmHg)[193].

Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol-water coefficient: Log K_{ow} = <2. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation skin contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic, may be fatal if inhaled, swallowed or absorbed through skin. Contact with molten substance may cause severe burns to skin and eyes. Avoid any skin contact. Effects of contact or inhalation may be delayed[DOT, ERG 152]. LD_{50} = (oral-rat) <800 mg/kg.

Long-Term Exposure: May cause cancer. Possible risk of forming tumors. May be mutagenic

Points of Attack: Not found.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: *Eyes*: First check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20−30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. *Immediately* transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin: immediately* flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, *immediately* call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation: immediately* leave the contaminated area; take deep breaths of fresh air. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician and be prepared to transport the victim to a hospital. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA should be used; if not available, use a level of protection greater than or equal to that advised under Protective Clothing. *Ingestion: do not induce vomiting*. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and *immediately* call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. *Do not induce vomiting. Immediately* transport the victim to a hospital.

Personal Protective Methods: Reacts—do *not* use—with cellulose-based absorbents and expanded polymeric absorbents. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; acid chlorides; acid anhydrides; and chloroformates. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2730 Nitroanisoles, liquid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3458 Nitroanisoles, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Eliminate all ignition sources (no smoking, flares, sparks or flames in immediate area). Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. *Do not get water inside containers.*

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. If tank, rail car or tank truck is involved in a fire, *isolate* for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire:* dry chemical, CO_2 or water spray. Large fire: water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving tanks or car/trailer loads:* fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. *For massive fire*, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Nitrobenzene is a pale yellow to dark brown oily liquid whose odor resembles bitter almonds (or black paste shoe polish). Molecular weight = 123.11; specific gravity (H_2O:1) = 1.2 @ 20°C; boiling point = 211°C; freezing/melting point = 5.7°C; vapor pressure = 0.3 mmHg @ 25°C; Flash point = 88°C (cc); Autoignition temperature = 480°C. Explosive limits: LEL = 1.8% @ 93°C; 2000 ppm[138]; UEL: 40%. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 1. Practically insoluble in water; solubility = 0.2%.

Potential Exposure: Nitrobenzene is used in the manufacture of explosives and aniline dyes and as solvent and intermediate. It is also used in floor polishes; leather dressings and polished; and paint solvents, and to mask other unpleasant odors. Substitution reactions with nitrobenzene are used to form *m*-derivatives. Pregnant women may be especially at risk with respect to nitrobenzene as with many other chemical compounds, due to transplacental passage of the agent. Individuals with glucose-6-phosphate dehydrogenase deficiency may also be special risk groups. Additionally, because alcohol ingestion or chronic alcoholism can lower the lethal or toxic dose of nitrobenzene, individuals consuming alcoholic beverages may be at risk.

Incompatibilities: Concentrated nitric acid, nitrogen tetroxide; caustics; phosphorus pentachloride; chemically-active metals, such as tin or zinc. Violent reaction with strong oxidizers and reducing agents. Attacks many plastics. Forms thermally unstable compounds with many organic and inorganic compounds.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm

Conversion factor: 1 ppm = 5.04 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.044; 0.02 ppm (NJ)

OSHA PEL: 1 ppm/5 milligram per cubic meter TWA [skin]

NIOSH REL: 1 ppm/5 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 1 ppm TWA [skin]; BEI: 5 mg[total *p*-nitrophenol]/g creatinine in urine/end-of-shift at end of work-week; 1.5% methemoglobin in blood, end-of-shift. confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 3 ppm

PAC-2: 20 ppm

PAC-3: 200 ppm

DFG MAK: [skin] Carcinogen Category 3B; BAT: 100 μg [Aniline, released from aniline-hemoglobin conjugate]/L in blood, for long-term exposure, after several shifts (sampling time) [skin]

Arab Republic of Egypt: TWA 1 ppm (5 milligram per cubic meter) [skin], 1993; Australia: TWA 1 ppm (5 milligram per cubic meter) [skin], 1993; Austria: MAK 1 ppm (5 milligram per cubic meter) [skin], 1999; Belgium: TWA 1 ppm (5 milligram per cubic meter) [skin], 1993; Denmark: TWA 1 ppm (5 milligram per cubic meter) [skin], 1999; Finland: TWA 1 ppm (5 milligram per cubic meter); STEL 3 ppm (15 milligram per cubic meter) [skin], 1999; France: VME 1 ppm (5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, [skin], 2003; Japan: 1 ppm (5 milligram per cubic meter) [skin], 1999; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; Poland: MAC (TWA) 3 milligram per cubic meter; MAC (STEL) 10 milligram per cubic meter, 1999; Russia: TWA 1 ppm; STEL 3 milligram per cubic meter [skin], 1993; Sweden: NGV 1 ppm (5 milligram per cubic meter), KTV 2 ppm (10 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 1 ppm (5 milligram per cubic meter), KZG-W 2 ppm (10 milligram per cubic meter) [skin], 1999; Turkey: TWA 1 ppm (5 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 1 ppm (5.1 milligram per cubic meter); STEL 2 ppm (10 milligram per cubic meter), [skin], 2000; New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic: TWA 1 ppm (5 milligram per cubic meter)[35]. Russia[43] has set 0.008 milligram per cubic meter (8 μ/m^3) as an MAC for ambient air in residential areas. Several states have set guidelines or standards for nitrobenzene in ambient air[60] ranging from 6.8 μ/m^3 (Massachusetts) to 16.7 μ/m^3 (New York) to 25 μ/m^3 (North Carolina and South Carolina) to 50 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2017. See also Method #2005.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA Two approaches were used to derive criterion levels for nitrobenzene. Based on available toxicity data, to protect public health the derived level is 19.8 mg/L. Using available organoleptic data, to control undesirable taste and odor qualities of ambient water the estimated level is 30 μg/L. Organoleptic data have limitations as a basis for establishing water criterion, and have no demonstrated relationship to potential adverse human health effects. State Drinking Water Guidelines: Arizona 3.5 μg/L; Florida 9.5 μg/L; Maine 3.5 μg/L.

Determination in Water: Methylene chloride extraction followed by exchange to toluene, gas chromatography with flame ionization detection (EPA Method 609) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log $K_{ow} = 1.86$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Penetrates the skin.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* Has caused headache and nausea @ 3-6 ppm. 40 ppm may cause intoxication. Symptoms due to decreased ability of blood to carry oxygen may include Blue coloration of lips, fingernails and earlobes; headache, dizziness, loss of coordination; labored breathing; rapid heartbeat; vomiting, coma, and death. Symptoms may be delayed Up to 4 hours. *Skin:* Easily absorbed through the skin and contributes significantly to symptoms listed under inhalation. May also cause irritation and allergic sensitization. Death has been reported from skin absorption. *Eyes:* May cause irritation and damage to the cornea. *Ingestion:* May cause symptoms listed under inhalation and include burning of throat, abdominal pain; bloody diarrhea; and enlarged spleen and liver. Death has resulted from as little as 0.4 ml (0.05 liq. oz), about 8 drops. High levels of exposure can interfere with the blood's ability to carry oxygen (methemoglobinemia). Signs and symptoms of acute exposure to nitrobenzene may be severe and include cyanosis (blue tint to the skin and mucous membranes), tachycardia (rapid hearth rate), Hypotension (low blood pressure), and cardiac arrhythmias. Respiratory depression and respiratory failure may also occur. Headache, lethargy, weakness, vertigo (dizziness), severe depression; and coma may be noted. Gastrointestinal symptoms include nausea and vomiting. Urine and vomitus may have the odor of bitter almonds.

Long-Term Exposure: Occupational exposure to 40 ppm for 6 months has caused intoxication and anemia. Can cause skin allergy. Can cause jaundice, liver and spleen damage; fatigue, bladder distress; nerve damage. May affect the blood forming organs, causing anemia. Exposure may affect vision (acuity and contraction of fields).

Points of Attack: Blood, liver, kidneys, cardiovascular system, skin.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), carboxyhemoglobin; whole blood (chemical/metabolite), methhemoglobin; whole blood (chemical/metabolite), methhemoglobin, end-of-shift; CBC; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift at end-of-work-week; urine (chemical/metabolite), end-of-work-week. Preemployment and periodic examinations should be concerned particularly with a history of dyscrasias, reactions to medications; alcohol intake; eye disease; skin, and cardiovascular status. Liver and renal functions should be evaluated periodically, as well as blood and general health. Follow methemoglobin levels until normal in all cases of suspected cyanosis. The metabolites in urine, *p*-nitro-and *p*-aminophenol, can be used as evidence of exposure. Liver function tests. *Note:* Alcohol ingestion increases the toxic effects of nitrobenzene. Persons with blood, heart, liver or lung diseases should not work with this substance.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Chlorinated polyethylene, polyvinyl alcohol, teflon, Viton/chlorobutyl, and Silvershield are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *50 ppm:* CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *200 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode).

Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Nitrobenzene must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) and chemically active metals (such as potassium, sodium, magnesium and zinc) caustic nitrogen tetroxide or silver perchlorate, since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1662 Nitrobenzene, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 seconds minimum) with scrubbing for nitrogen oxides abatement[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R 45; R50-45; R63; safety phrases: S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 4-Nitrobiphenyl exists as yellow plates or needles. Molecular weight = 199.21; boiling point = 340°C; freezing/melting point = 113.9°C; Flash point = 143.3°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Insoluble in water.

Potential Exposure: 4-Nitrobiphenyl was formerly used in the synthesis of 4-aminodiphenyl. It is presently used only for research purposes; there are no commercial uses.

Incompatibilities: Incompatible with strong reducing agents such as hydrides, oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = Not determined, potential occupational carcinogen

OSHA: Cancer Suspect Agent [skin], see Code of Federal Regulations 29CFR1910.1003.

NIOSH REL: A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: [skin] Suspected Human Carcinogen *as 4-nitrodiphenyl*

PAC Ver. 29[138]

PAC-1: 6.7 milligram per cubic meter

PAC-2: 74 milligram per cubic meter

PAC-3: 440 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2

Australia: carcinogen, 1993; Austria: [skin], carcinogen, 1999; Belgium: carcinogen, 1993; Finland: carcinogen, 1999; Norway: TWA 0.01 milligram per cubic meter, 1999; Sweden: carcinogen, 1999; Switzerland: [skin], carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. Several states have set guidelines or standards for nitrobiphenyl in ambient air[60] ranging from zero (New York, North Dakota, South Carolina, Virginia) to 2.77 μ/m^3 (Pennsylvania).

Determination in Air: Collection on a glass fiber filter in series with silica gel, elution with 2-propanol, analysis by gas chromatography/flame ionization detection; NIOSH (II-4) P&CAM Method #273; OSHA Analytical Method PV-2082.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 890 μg/L based on health effects.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Percutaneous absorption.

Harmful Effects and Symptoms

Short-Term Exposure: 4-Nitrobiphenyl can affect you when breathed in and by passing through your skin. Other health effects are not well known at this time, but contact with biphenyls can cause irritation of the skin and eyes; and may cause liver nerve damage; disturbed sleep; headache, lethargy (drowsiness or indifference), dizziness; dyspnea (breathing difficulty); ataxia, weakness, methemoglobinemia, urinary burning; acute hemorrhagic cystitis.

Long-Term Exposure: 4-Nitrobiphenyl is a potential occupational carcinogen. Handle with extreme caution. May cause liver damage. Related compounds have caused damage to the nerves of the arms and legs.

Points of Attack: Bladder, blood, liver. Cancer site in animals: bladder tumors.

Medical Surveillance: OSHA mandates tests and information on the following: *Increased Risk;* reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking. NIOSH lists the following tests: *increased risk*; reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; urine (chemical/metabolite) placement and periodic examinations should include an evaluation of exposure to other carcinogens, as well as an evaluation of smoking; or use of alcohol and medications; and of family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, cystoscopy should be done at once. The general health of exposed persons should also be evaluated in periodic examinations. Liver function tests, CBC. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045 and 1910.1003.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and flame. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.
Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.
Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Incineration @ 982°C/2.0 seconds (minimum) with scrubbing for nitrogen oxides abatement.

Nitrocellulose N:0420

Formula: $C_{12}H_{16}(ONO_2)_4O_6$
Synonyms: Box toe gum; Celloidin; Cellulose nitrate solution; Collodion cotton; Gun cotton; Nitrocellulose; Nitrocellulose gum; Nitrocellulose solution; Nitrocellulose, with plasticizer; Nitrocotton; Nitron; Nixon N/C; NT; Pyroxylin solution; Synpor; Tsapolak 964; Xyloidin
CAS Registry Number: 9004-70-0
HSDB Number: 1973
RTECS Number: QW0970000
UN/NA & ERG Number: UN2059 [nitrocellulose, solution, flammable with not >12.6% nitrogen, by mass, and not > 55% nitrocellulose]/127; UN2555 [nitrocellulose with water with not <25% water, by mass]/113; UN2556 [nitrocellulose with alcohol with not <25% alcohol by mass, and with not >12.6% nitrogen, by dry mass]/113; UN2557 [nitrocellulose, with not >12.6% nitrogen, by dry mass, or nitrocellulose mixture with pigment or nitrocellulose mixture with plasticizer or nitrocellulose mixture with pigment and plasticizer]/133; UN0340 [Nitrocellulose, dry or wetted with <25% water (or alcohol), by mass]/112; UN0341 [nitrocellulose, unmodified or plasticized with <18% plasticizing substance, by mass]/112; UN0343 [nitrocellulose, plasticized with not <18% plasticizing substance, by mass]/112; UN0342 [nitrocellulose, wetted with not <25% alcohol, by mass]/112; 3270 (Nitrocellulose membrane filters)/133.
Regulatory Authority and Advisory Information
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard: explosives* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).
Hazard Alert: Explosive, Highly flammable solid.
Hazard symbols, risk, & safety statements: Hazard symbol: E, F+, T, Xi, Xn; risk phrases: R1 (containing more than 12,6% nitrogen); R3; R11; R12; R16; R17; R22; R36/38; R61; R66; R67; safety phrases: S1; S1; S7; S9; S16; S21; S23; S29; S33; S35; S36/37/39; S45; S53; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Nitrocellulose is a pulpy, cotton-like solid, or a colorless liquid solution. Molecular weight = 504.3; specific gravity (H_2O:1) = 1.66; boiling point = about 34°C; Flash point = 12–27°C (wet with alcohol); Autoignition

temperature = 160°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 3 (oxidizer). Insoluble in water.

Potential Exposure: It is used in making explosives, rocket propellants and celluloid.

Incompatibilities: Dust and powder form explosive mixture with air. Keep wet; do not allow to become dry. Dry material is a shock-sensitive explosive. Desensitize using water or alcohol. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 27

PAC-1: 15 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 990 milligram per cubic meter

Harmful Effects and Symptoms

Short-Term Exposure: Only those associated with the flammable and explosive nature of this flammable and reactive material. However, it may be wetted with alcohol, ether, or other dangerous liquid material that can be irritating to the eyes, nose, and throat. If inhaled will cause dizziness, difficult breathing; or loss of consciousness.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls must be effective to ensure that exposure to nitrocellulose does not occur. See respirator for solvent used as a wetting agent.

Storage: Color code—Red: Flammability Hazard: Store in a flammable materials storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nitrocellulose must be stored to avoid contact with oxidizers, strong acids (such as hydrochloric, sulfuric, and nitric) and alkaline materials (such as sodium hydroxide and potassium hydroxide), since violent reactions occur. Store nitrocellulose away from high temperatures and direct sunlight. Do not allow material to become dry. Sources of ignition, such as smoking and open flames, are prohibited where nitrocellulose is handled, used, or stored. Wherever nitrocellulose is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2555, UN2556 and UN2557 requires a shipping label of "FLAMMABLE SOLID." They fall in DOT Hazard Class 4.1. UN0342 and UN0343 requires a shipping label of "EXPLOSIVE." They fall in DOT Hazard Class 1.3C.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Immediately flood spill area with water, collect material and deposit in sealed containers. Keep nitrocellulose out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing:[17] Presents an unusually severe fire hazard; when dry, ignites readily and burns explosively. Should never be kept for any appreciable time in any dry fibrous state. Unstabilized product decomposes gradually at relatively low temperature, with evolution of copious volumes of toxic and flammable gases, and rapid heat generation. In prolonged storage and aging of nitrocellulose plastics, camphor is lost with deterioration and the decomposition temperature may be lowered to 40°C. The resulting flameless decomposition is self-sustaining and accelerative, presenting the added hazard of dangerous pressures in building structures.

Use extreme caution in approaching fires involving this material as it may explode. No attempt should be made to fight advanced fires, except for remote activation of installed fire extinguishing equipment and/or with unmanned fixed turrets and hose nozzles. The surrounding areas should be evacuated. Fires should be approached from upwind and SCBA used. Since cellulose nitrate supplies its own oxygen, prompt cooling with a large quantity of water is essential; water applied through spray nozzles is effective if fused quickly and in sufficient volume, in a manner to wet the entire exposed surface. Thermal decomposition products may include oxides of nitrogen (and possibly hydrogen cyanide, and carbon monoxide). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1996; NIOSH: Potential occupational carcinogen.

California Proposition 65 Chemical[102]: Cancer 10/29/1999.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/24/25; R40; R48/20/21/22; R62; R63; R68; R51/53; safety phrases: S1/2; S28; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *p*-Nitrochlorobenzene is a yellow crystalline solid with a sweet odor. Molecular weight = 157.56; specific gravity (H_2O:1) = 1.52; 1.3 @ 90°C; boiling point = 242°C; freezing/melting point = 82°C; vapor pressure = 0.2 mmHg @ 20°C; Flash point = 127.2°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 3. Shock and heat sensitive. Insoluble in water.

Potential Exposure: *p*-Nitrochlorobenzene (PNCB) is used as an intermediate in pesticide (parathion) manufacture, drug (phenacetin and acetaminophen) manufacture; and in dye making; rubber and antioxidant manufacture.

Incompatibilities: A strong oxidizer. Reacts violently with oxidizers, combustibles, alkalis, sodium methoxide; and reducing materials

Permissible Exposure Limits in Air

NIOSH IDLH = 100 milligram per cubic meter, potential occupational carcinogen.

OSHA PEL: 1 milligram per cubic meter TWA [skin]

NIOSH REL: A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.BEIM issued for Methemoglobin inducers.

ACGIH TLV[1]: 0.1 ppm/0.64 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 1.9 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 3B

Australia: TWA 0.1 ppm (0.6 milligram per cubic meter) [skin], 1993; Austria Suspected: carcinogen, 1999; Belgium: TWA 0.1 ppm (0.64 milligram per cubic meter) [skin], 1993; Denmark: TWA 0.1 ppm (0.64 milligram per cubic meter) [skin], 1999; Finland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter [skin], 1999; Hungary: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter [skin], 1993; Japan: 0.1 ppm (0.64 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, [skin], 2003; Norway: TWA 1 milligram per cubic meter, 1999; the Phillipines: TWA 1 milligram per cubic meter [skin], 1993; Poland: MAC (TWA) 1 milligram per cubic meter; MAC (STEL) 3 milligram per cubic meter, 1999; Russia: TWA 0.1 ppm; STEL 1 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 1 milligram per cubic meter, KZG-W 2 milligram per cubic meter [skin], 1999; United Kingdom: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia[43] set a MAC in ambient air of residential areas of 0.004 milligram per cubic meter both on a momentary and a daily average basis. Several states have set guidelines or standards for 4-chloronitrobenzene in ambient air[60] ranging from 3.3 μ/m^3 (New York) to 5 μ/m^3 (South Carolina) to 10 μ/m^3 (Florida) to 20 μ/m^3 (Connecticut) to 24 μ/m^3 (Nevada) to 30 μ/m^3 (North Dakota) to 50 μ/m^3 (Virginia) to 83.33 μ/m^3 (Kansas).

Determination in Air: Use NIOSH Analytical Method (IV) #2005,[18] Nitrobenzene.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin on contact. Inhalation can cause irritation of the respiratory tract with coughing and wheezing. High levels can interfere with the body's ability to carry oxygen (methemoglobinemia) causing cyanosis, headache, dizziness, fatigue. Can also cause nausea, vomiting, dyspnea. Higher levels can cause trouble breathing; collapse, and death.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Can affect the nervous system. May damage the liver and kidneys. May cause methemoglobinemia, hemoglobinuria, anemia, spleen, bone marrow changes; reproductive effects. Potential occupational carcinogen. In animals: hematuria (blood in the urine)

Points of Attack: Blood, liver, kidneys, cardiovascular system; spleen, bone marrow; reproductive system. Cancer site in animals: vascular and liver tumors.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Methhemoglobin; CBC. Consider the points of attack in preplacement and periodic physical examinations. Evaluation by a qualified allergist. Liver and kidney function tests. Alcohol consumption may increase liver damage caused by PNCB.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator and protect from shock, heat sources, light, oxidizers, reducing agents; alkalis, and sodium methoxide. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1578 Chloronitrobenzenes, solid or liquid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. It does not readily ignite. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. Thermal decomposition products may include nitrogen oxides and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 second for primary combustion; 1204°C, 1.0 second for secondary combustion). The formation of elemental chlorine can be prevented through injection of steam or methane into the combustion process. nitrogen oxides may be abated through the use of thermal or catalytic devices.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Strong oxidizer.

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R11; R23/24/25; R36/37/38; R50/53; safety phrases: S13; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Nitrocyclohexane is a highly flammable, colorless liquid. Molecular weight = 129.18; specific gravity (H_2O:1) = 1.06 @ 20°C; boiling point = (decomposes) 206°C; freezing/melting point = −34°C; Flash point = 88°C; vapor pressure = 0.35 mmHg @ 25°C;. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 2 (oxidizer). Insoluble in water.

Potential Exposure: Used in organic synthesis.

Incompatibilities: A nitro compound; a fire and explosive hazard. May form explosive mixture with air. Nitrocyclohexane, a nitroalkane, is a strong oxidizing agents. If mixed with reducing agents, including hydrides, sulfides and nitrides, they may begin a vigorous reaction that culminates in a detonation. Nitroalkanes are milder oxidizing agents, but still react violently with reducing agents at higher temperature and pressures. Nitroalkanes react with inorganic bases to form explosive salts. The presence of metal oxides increases the thermal sensitivity of nitroalkanes. Nitroalkanes with more than one nitro group are generally explosive. Incompatible with alkalis, and metal oxides. This chemical is highly reactive and may be heat-and shock-sensitive.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.14 milligram per cubic meter

PAC-2: 1.5 milligram per cubic meter

PAC-3: 9 milligram per cubic meter

Russia[43] set a MAC in work-place air of 1.0 milligram per cubic meter.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

The LD_{50} = (oral-mouse) 250 mg/kg (moderately toxic).

Short-Term Exposure: Insufficient data is available on the effect of this substance on human health, therefore utmost care must be taken. May be absorbed through the skin. May be an irritant to the eyes, skin and respiratory system. Similar chemical can cause cyanosis due to formation of methemoglobin.

Long-Term Exposure: Similar chemicals can cause kidney and liver damage.

Points of Attack: Most of the above information is based on similar nitro compounds of aromatic hydrocarbons. May cause blood, liver and kidney effects.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended. The following might be considered: blood methemoglobin level, CBC, liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. pressure, pressure-demand, full facepiece SCBA (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, alkalis, metal oxides. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3382 Toxic by inhalation liquid, n.o.s. with an LC_{50} lower than or equal to 1000 ml/m3 and saturated vapor concentration ≥ 10 LC_{50}, Hazard Class: 6.1; Labels: 6.1 Technical Name Required, Inhalation Hazard Zone B.

Spill Handling:

Toxic/Poisonous by inhalation liquid, n.o.s. (Inhalation Hazard Zone B)

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft./m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spilled material; stop leak if you can do so without risk. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Stay upwind; keep out of low areas. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Formula: $C_2H_5NO_2$: $CH_3CH_2NO_2$

Synonyms: Ethane, nitro-; Nitroetano (Spanish)

CAS Registry Number: 79-24-3

HSDB Number: 105

RTECS Number: KI5600000

UN/NA & ERG Number: UN2842/129

EC Number: 201-188-9 [*Annex I Index No.:* 609-035-00-1]

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Inconclusive: Mammalian micronucleus.

Hazard Alert: Highly flammable, Suspected reprotoxic hazard.

List 1, DEA chemical code 6724 (Title 21 CFR1310.02)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R11; R20/22; R63; safety phrases: S2; S9; S21; S25; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Nitroethane is a colorless, oily liquid with a mild, fruity odor. The Odor Threshold is 163 ppm[41]. Molecular weight = 75.08; specific gravity (H_2O:1) = 1.05; boiling point = 113.9°C; freezing/melting point = −90°C; vapor pressure = 21 mmHg @ 25°C; 15.6 mmHg @ 20°C; Flash point = 28°C. Begins to decompose @ 300°C; Autoignition temperature = 414°C. Explosive limits: LEL = 3.4%; UEL: Unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 3. Slightly soluble in water; solubility = 5%.

Potential Exposure: Nitroethane is used as solvent for polymers, cellulose esters; vinyl, waxes, fats, dyestuffs, and alkyd resins; as a stabilizer. It has been used as a rocket propellant. It is used as an intermediate in pharmaceutical manufacture and in pesticide manufacture.

Incompatibilities: A nitroparaffin, nitroethane forms explosive mixture with air. Explodes when heated or when shocked; in confined area, with elevated temperatures. A strong reducing agent. Violent reaction with oxidizers, hydrocarbons, other combustibles; amines, metal oxides. Forms shock-sensitive compounds with strong acids; strong alkalis. Attacks some plastics and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm

OSHA PEL: 100 ppm/310 milligram per cubic meter TWA

NIOSH REL: 100 ppm/310 milligram per cubic meter TWA

ACGIH TLV[1]: 100 ppm/307 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 60 ppm

PAC-2: 170 ppm

PAC-3: 1000 ppm

DFG MAK: 100 ppm/310 milligram per cubic meter TWA; Peak Limitation Category II(4); Pregnancy Risk Group D

Australia: TWA 100 ppm (310 milligram per cubic meter), 1993; Austria: MAK 100 ppm (310 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (307 milligram per cubic meter), 1993; Denmark: TWA 100 ppm (310 milligram per cubic meter), 1999; Finland: TWA 100 ppm (310 milligram per cubic meter); STEL 150 ppm (465 milligram per cubic meter), 1999; France: VME 100 ppm (310 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 60 milligram per cubic meter, 2003; the Phillipines: TWA 100 ppm (310 milligram per cubic meter), 1993; Poland: MAC (TWA) 30 milligram per cubic meter, MAC (STEL) 240 milligram per cubic meter, 1999; Russia: STEL 30 milligram per cubic meter, 1993; Sweden: TWA 20 ppm (60 milligram per cubic meter); STEL 50 ppm (150 milligram per cubic meter), 1999; Switzerland: MAK-W 100 ppm (310 milligram per cubic meter), 1999; Turkey: TWA 100 ppm (310 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm

(312 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 100 ppm. Several states hve set limits in ambient air ranging from 3.1 milligram per cubic meter (North Dakota) to 5.2 milligram per cubic meter (Virginia) to 6.2 milligram per cubic meter (Connecticut) to 7.38 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2526.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 0.18$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing and wheezing. High exposure could cause headache, dizziness and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. LD_{50} = (oral-rat) 250 mg/kg (moderately toxic).

Long-Term Exposure: May cause liver and kidney damage. Can cause dermatitis, drying and cracking skin. Can cause lung irritation; bronchitis may develop.

Points of Attack: Skin, respiratory system; central nervous system; kidneys, liver.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or Sa: Pd,Pp (APF = 1000): ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator away from oxidizers, strong acids; amines, alkalis, hydrocarbons, combustibles, metal oxides; strong bases; and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2842 Nitroethane, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Do not use dry chemical powder. Use carbon dioxide, or alcohol; or polymer foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes[22].

Regulatory Authority and Advisory Information

Carcinogenicity: NTP (*technical grade*)13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC (*technical grade*): Animal Sufficient Evidence; Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat, 1978; (feed); clear evidence: mouse, 1979; (feed); no evidence: rat, 1979. United States Environmental Protection Agency Gene-Tox Program, Positive: Carcinogenicity-mouse/rat; Inconclusive: Mammalian micronucleus.

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Poison, High acute toxicity, Highly flammable, Endocrine disruptors (medium), Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, N; risk phrases: R11; R45; R20/22; R23/25; R33; R50/53; R61; R62; R63; safety phrases: S20/21; S28; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Nitrofen is a crystalline solid. Molecular weight = 284.10; freezing/melting point = 70−71°C; vapor pressure = 1.2×10^{-7} mm @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 0. Very slightly soluble in water.

Potential Exposure: Nitrofen is a contact herbicide used for pre-and post-emergency control of annual grasses and broadleaf weeds on a variety of food and ornamental crops. Occupational exposure to nitrofen, primarily through inhalation and dermal contact may occur among workers at production facilities. Field handlers of the herbicide are subject to inhalation exposure during application procedures.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Finland: carcinogen, 1999; Russia: STEL 1 milligram per cubic meter, 1993; United Kingdom: carcinogen, TWA 1 ppm (7.1 milligram per cubic meter), 2000. Russia set a MAC in ambient air in residential areas of 0.02 milligram per cubic meter on a once-daily basis and 0.01 milligram per cubic meter on an average daily basis. Pennsylvania has set a guideline for nitrofen in ambient air[60] of 0.75 μ/m^3.

Permissible Concentration in Water: Nitrofen presumably falls under the EPA Priority Toxic Pollutant category of haloethers[6] but specific limits have not been set. Russia has set a limit in surface water of 4.0 mg/L.

Determination in water: Hazardous to the aquatic environment. Fish Tox = 92.54948000 ppb (INTERMEDIATE). Octanol-water coefficient: Log K_{ow} = >4.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Toxic by ingestion. Severe eye irritant. Causes skin irritation on contact. Inhalation can cause irritation to the respiratory tract. May cause difficult breathing; fatigue, and loss of appetite.

Long-Term Exposure: May cause cancer. Long-term exposure may cause damage to the blood cells, causing low white cell (leukocyte) count, reduced hemoglobin; and reduced serum cholinesterase and erythrocyte catalase activities. May cause liver damage. May affect the nervous system.

Points of Attack: Blood, liver, kidneys, nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure, CBC. Liver function tests. Examination of the nervous system and interview for brain effects.

First Aid: *Skin Contact*: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others[52]. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower that his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3345 Phenoxyacetic acid derivative pesticide, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all sources of ignition and dampen spilled material with 60−70% acetone to avoid airborne dust. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small quantities may be landfilled but large quantities should be incinerated[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Nitrofen, Trenton, NJ (September 2001).

Nitrogen N:0470

Formula: N_2

Synonyms: Liquid nitrogen; Nitrogen, compressed; Nitrogen, cryogenic liquid; Nitrogen gas; Nitrogen, refrigerated liquid

CAS Registry Number: 7727-37-9

HSDB Number: 5060

RTECS Number: QW9700000

UN/NA & ERG Number: UN1066 (compressed)/121; UN1977 (refrigerated liquid)/120

EC Number: 231-783-9

Regulatory Authority and Advisory Information

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Hazard symbols, risk, & safety statements: risk phrases: R5, R21; safety phrases: S9; S33; S38 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Nitrogen is a nonflammable, stable, odorless, cryogenic liquid or a compressed gas. Molecular weight = 28.02; specific gravity (H_2O:1) = 0.81 @ −196°C; boiling point = −196°C; freezing/melting point = −210°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Slightly soluble in water.

Potential Exposure: Nitrogen is present in the air we breathe. Health effects may occur at concentrations above 80%. It has many medical and industrial uses including the quick freezing of food. The gas is used for purging, heat treating; food freezing; annealing, cooling, oil recovery; in the inert blanketing of sensitive materials and as a reactant in chemical synthesis of ammonia.

Incompatibilities: Containers may explode when heated. Liquid nitrogen is very unreactive, nonflammable, noncombustible and nontoxic. Contact with water may result in vigorous or violent boiling and extremely rapid vaporization. If the water is hot, there is the possibility that a liquid "superheat" explosion may occur. Pressures may build to dangerous levels if the liquid contacts water in a closed container[136].

Permissible Exposure Limits in Air Before entering an enclosed space where nitrogen may be present, oxygen content should be tested to ensure that it is at least 19% by volume.

Determination in Air:

OSHA PEL: Simple asphyxiant-inert gases and vapors

NIOSH REL: Simple asphyxiant-inert gases and vapors

ACGIH TLV[1]: Simple asphyxiant

PAC Ver. 29[138]

PAC-1: 796,000 (7.96E + 05) ppm

PAC-2: 832,000 (8.32E + 05) ppm

PAC-3: 869,000 (8.69E + 05) ppm

United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Simple asphyxiant: nitrogen is a simple asphyxiant inert gas or vapor; *oxygen* content should be at least 19%.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* No significant toxic effects except as an asphyxiant; that is, it may threaten life if levels are so high as to reduce oxygen levels below 19%. Since nitrogen is odorless, colorless and tasteless, there may not be adequate warning of high levels. Symptoms of lack of oxygen may include nausea, drowsiness, Blue coloration of skin and lips; unconsciousness, and death. *Skin:* Liquid may cause frostbite and freezing burns. *Eyes:* Liquid may cause frostbite and freezing burns. *Ingestion:* Liquid may cause frostbite and cryogenic burns.

Long-Term Exposure: No information is known at this time.

First Aid: *Inhalation:* Move person to fresh air. Give oxygen or artificial respiration as necessary. *Skin:* Remove liquid-soaked clothing after allowing to thaw. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention. *Eyes:* Seek immediate medical attention if contact with liquid occurs. *Ingestion:* Seek medical attention as necessary.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming

frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. If vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Respirator Selection: Exposure to nitrogen is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where nitrogen is handled, used, or stored. Store liquid containers and cylinders in cool, well-ventilated areas. Use only in well-ventilated areas. Cylinders must be secured and protected against damage. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1066 Nitrogen, compressed, Hazard Class:, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas; UN1977 Nitrogen, refrigerated liquid cryogenic liquid, Hazard Class:, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If liquid nitrogen is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate the area of spill or leak. Stop the leak or move the container to a safe area and allow the liquid to evaporate. If nitrogen gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Nitrogen itself does not burn. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Vent to atmosphere.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. European/International Regulations (*nitrogen dioxide*; *nitrogen tetraoxide*): Hazard symbol: T+, N; risk phrases: R8; R26; R34; R62; R63; safety phrases: S1/2; S9; S26; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (*nitrogen dioxide*; *nitrogen tetraoxide*)

Description: Nitrogen dioxide (and nitrogen tetroxide, the solid dimer) is a dark brown gas (above 21°C) or a yellow, fuming liquid or colorless solid with a pungent, acrid odor. The solid form is colorless below about −11°C; it is found structurally as N_2O_4. Molecular weight = 46.01; 92 (tetroxide); specific gravity (H_2O:1) = 1.44 @ 20°C; 1.5 @ 20°C (tetroxide); boiling point = 21°C (dioxide & tetroxide); freezing/melting point = −9.3°C; −11.2°C (tetroxide); vapor pressure = 908 mmHg @ 25°C. Decomposes @ 160°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity ₩ (oxidizer). Decomposes (reacts) with water.

Potential Exposure: Nitrogen dioxide is found in automotive and diesel emissions. Nitrogen dioxide is an industrial chemical used as an intermediate in nitric and sulfuric acid manufacture; it is used in the nitration of organic compounds; it is used as an oxidizer in liquid propellant rocket fuel combinations. It is also used in firefighting, welding and brazing.

Incompatibilities: A strong oxidizer. Reacts violently with combustible matter, chlorinated hydrocarbons; ammonia, carbon disulfide; reducing materials. Reacts with water, forming nitric acid and nitric oxide. Attacks steel in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 20 ppm

Conversion factor: 1 ppm = 1.88 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 5 ppm

OSHA PEL: 5 ppm/9 milligram per cubic meter Ceiling Concentration

NIOSH REL: 1 ppm/1.8 milligram per cubic meter STEL

ACGIH TLV[1]: 3 ppm/5.6 milligram per cubic meter TWA; 5 ppm/9.4 milligram per cubic meter STEL, not classifiable as a human carcinogen

10102-44-0

PAC* Ver. 29[138]

PAC-1: **0.50**$_{\mathbf{A}}$ ppm

PAC-2: **12**$_{\mathbf{A}}$ ppm

PAC-3: **20**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.5 ppm/0.95 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D; Carcinogen Category 3B

Arab Republic of Egypt: TWA 3 ppm (6 milligram per cubic meter), 1993; Austria: MAK 3 ppm (6 milligram per cubic meter), 1999; Denmark: TWA 3 99 m (5.6 milligram per cubic meter), 1999; Finland: TWA 3 ppm (6 milligram per cubic meter); STEL 6 ppm (12 milligram per cubic meter), 1999; France: VLE 3 ppm (6 milligram per cubic meter), 1999; Japan: pending, 1999; the Netherlands: MAC-TGG 4 milligram per cubic meter, 2003; the Phillipines: TWA 5 ppm (9 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 10 milligram per cubic meter, 1999; Sweden: NGV 2 ppm (4 milligram per cubic meter), TGV 5 ppm (13 milligram per cubic meter), 1999; Switzerland: MAK-W 3 ppm (6 milligram per cubic meter), KZG-W 6 ppm (12 milligram per cubic meter), 1999; Thailand: TWA 5 ppm (9 milligram per cubic meter), 1993; Turkey: TWA 5 ppm (9 milligram per cubic meter), 1993; United Kingdom: TWA 3 ppm (5.7 milligram per cubic meter); STEL 5 ppm (9.6 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 5 ppm. Russia[43] set a MAC for ambient air in residential areas of 0.085 milligram per cubic meter (85 μ/m^3). Several states have set guidelines or standards for nitrogen dioxide in ambient air[60] ranging from 100 μ/m^3 (Arizona and Connecticut) to 143 μ/m^3 (Nevada).

10544-72-6, nitrogen tetroxide

NIOSH IDLH = 20 ppm

PAC-1: **0.25**$_{\mathbf{A}}$ ppm

PAC-2: **6.2**$_{\mathbf{A}}$ ppm

PAC-3: **10**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Air: Use NIOSH Analytical Method (IV) #6014, Nitric oxide and nitrogen dioxide; OSHA Analytical Methods ID-109 and ID-182.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nitrogen dioxide and its vapors irritate the eyes, skin, and respiratory tract. Inhalation exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Acute exposure to nitrogen dioxide may be severe and result in a weak, rapid pulse; cyanosis (blue tint to the skin and mucous membranes); and circulatory collapse. Cough, dyspnea (shortness of breath), bronchitis, pneumonitis, and pulmonary edema may occur following inhalation exposure. Gastrointestinal symptoms include nausea and abdominal pain. Fatigue, lethargy, restlessness, fever, anxiety, headache, mental confusion; and loss of consciousness may also occur. Contact with the skin and mucous membranes may result in severe irritation and burns. When liquid nitrogen dioxide contacts the skin, frostbite will result. *Inhalation:* 10–20 ppm can cause mild irritation of the nose and throat. 25–50 ppm can cause an inflammation of the lungs, such as bronchitis or pneumonia. Levels above 100 ppm can cause death. Only highly concentrated fumes cause immediate symptoms, such as coughing, choking, headache, nausea and stomach or chest pain. However, exposures to less concentrated fumes may produce these symptoms after 5–72 hours. Rapid and shallow breathing; bluish coloration in skin and unconsciousness may develop along with lung irritation or congestion. *Skin:* Can cause severe irritation and burns. *Eyes:* Levels of 10–20 ppm can cause irritation. Higher vapor concentration can cause eye injury. Contact with liquid can cause severe chemical burns. *Ingestion:* Can cause burns in mouth, throat and stomach.

Long-Term Exposure: Can cause headache, weakness, loss of sleep and appetite; sores in nose and mouth; nausea and erosion of teeth. Exposure to 0.4–2.7 ppm for 4–6 years has been associated with emphysema and bronchitis. Genetic changes have been shown in experimental animals; possibly causes toxic effects on human reproduction. Nitrogen dioxide may affect the immune system and lungs, resulting in a decreased resistance to infection.

Points of Attack: Respiratory system, lungs, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: Electrocardiogram, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; white blood cell count/differential. Preplacement and periodic examinations should be concerned particularly with the skin, eyes, and with significant pulmonary and heart diseases. Smoking history should be known. Methemoglobin studies may be of interest if exposure to nitric oxide is present. In the case of nitric acid vapor mist exposure, dental effects may be present.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to Physician: Inhalation: bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis. Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Individuals should be equipped with supplied air respirators with full facepiece or chemical goggles, and enclosed areas should be properly ventilated before entering. An observer equipped with appropriate respiratory protection should be outside the area and standing by to supply any aid needed. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash, where nitrogen oxides may accumulate (e.g., silos).

Respirator Selection: NIOSH: *20 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* *Only nonoxidizable sorbents are allowed (NOT charcoal).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow Stripe: Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Protect containers from physical damage. Store separately from combustible, organic and readily oxidizable materials. Transfer facilities should be outdoors.

Shipping: UN1067/124 Dinitrogen tetroxide, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A. UN1975 Nitric oxide and dinitrogen tetroxide mixtures or Nitric oxide and nitrogen dioxide mixtures, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Nitric oxide and dinitrogen tetroxide mixtures or Nitric oxide and nitrogen dioxide mixtures, Inhalation Hazard Zone A

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package) dinitrogen tetroxide, nitrogen dioxide, Dinitrogen tetroxide and Nitric oxide mixture; Nitric oxide and Dinitrogen tetroxide mixture; Nitric oxide and Nitrogen dioxide mixture; Nitric oxide and Nitrogen tetroxide mixture; Nitrogen dioxide and Nitric oxide mixture; Nitrogen tetroxide and Nitric oxide mixture

First: Isolate in all directions (ft./m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 1000/400
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 1.8/2.8

Dinitrogen tetroxide and nitric oxide mixture; nitric oxide and dinitrogen tetroxide mixture; nitric oxide and nitrogen dioxide mixture; nitric oxide and nitrogen tetroxide mixture; nitrogen dioxide and nitric oxide mixture; nitrogen tetroxide and nitric oxide mixture

First: Isolate in all directions (ft./m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.4/2.3

Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Evacuate area endangered by gas. For water spills, neutralize with agricultural lime (slaked lime), crushed limestone, or sodium bicarbonate. For an air spill, apply water spray or mist to knock down vapors. Vapor knockdown water is corrosive or toxic and should be diked for containment. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Stop leak if you can do so without risk. Use water spray to reduce vapor but do not put water on leak or spill area. Isolate area until gas has dispersed. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: NO_2 is nonflammable but supports combustion. Wearing proper equipment, shut off flow of gas. Use water spray to keep containers cool and to also direct escaping gas away from personnel attempting to shut off leak. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destroy by incineration with the addition of hydrocarbon fuel, controlled in such a way that combustion products are elemental nitrogen, CO_2, and water. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen

California Proposition 65 Chemical[102]: Cancer 4/1/1988; developmental 7/1/1990

Hazard Alert: Exposure can be lethal, Corrosive, Possible risk of forming tumors, Drug, Suspected of causing genetic defects, Suspected reprotoxic hazard, Drug (antineoplastic agent).

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C; risk phrases: R14; R21/22/23; R26/27/28; R31; R34; R35; R42/43; R45; R46; R61; R62; R63; safety phrases: S36/37/39; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Highly toxic white to yellowish crystalline solid or powder. May be available as an unstable aqueous solution. Fish-like odor. Molecular weight = 192.515; freezing/melting point = ~110°C. Hazard identification (based on NFPA-704 M Rating System): Health 4; flammability 0; reactivity 0. Water soluble. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure:

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, bases. Dry crystals are stable at temperatures up to 40°C. *Note:* Chlorinating agents destroy nitrogen mustards. Dry chlorinated lime and chloramines with a high content of active chlorine vigorously chlorinate nitrogen mustards to the carbon chain, giving low toxicity products. In the presence of water this interaction proceeds less actively. They are rapidly oxidized by peracids in aqueous solution at weakly alkaline pH. In acid solution the oxidation is much slower.

Permissible Exposure Limits in Air:
PAC* Ver. 29[138]
PAC-1: 0.013 milligram per cubic meter
PAC-2: 0.14 milligram per cubic meter
PAC-3: 0.83 milligram per cubic meter
DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2A; Germ Cell Mutation Category 2

Routes of Entry: Inhalation, ingestion, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: This compound is highly toxic and may be fatal if inhaled, swallowed or absorbed through the skin. It is a powerful vesicant. A severe irritant of the mucous membranes and a powerful vesicant, high concentrations are extremely destructive to tissues of the skin, eyes, mucous membranes and upper respiratory tract. Symptoms of exposure to this compound may include irritation of the mucous membranes, vesication, burning sensation, destruction of tissues of the skin, eyes (possible necrotizing uveitis), mucous membranes and upper respiratory tract, shortness of breath and headache, weakness, nausea, vomiting, diarrhea, and anorexia. Thrombophlebitis, thrombosis and necrosis have occured following extravascular injections. LD_{50} = (oral-rat) 10 mg/kg.

Long-Term Exposure: Exposure can lead to hemolytic anemia, chromosomal abnormalities, agranulocytosis, thrombocytopenia, depression of the hematopoietic system, persistent pancytopenia, oligomenorrhea, temporary or permanent amenorrhea. In males it may cause impaired spermatogenesis, azoospermia and total germinal aplasia. Problems of bone marrow function, kidney function, gastrointestinal symptoms, hemorrhagic complications, maculopapular skin eruptions, herpes zoster.

Points of Attack: Eyes, skin, kidneys, blood, gastrointestinal tract, male sperm, women's reproductive system, hematopoietic system, bone marrow.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Individuals should be equipped with supplied air respirators with full facepiece or chemical goggles, and enclosed areas should be properly ventilated before entering.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. In order to maintain stability, keep dry crystals at temperatures below 40°C. Store in tightly closed containers in a well-ventilated area away from oxidizing agents; chemically active metals; strong bases; moisture. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2928 Toxic solids, corrosive, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep ethylene glycol diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic fumes of hydrogen chloride gas and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is not appropriate to dispose of expired or waste product such as lab chemicals by flushing them down the toilet or discarding them to the trash. Larger quantities shall carefully take into consideration applicable EPA, and FDA regulations. If possible return the lab chemicals to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste lab chemicals shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Nitrogen Oxides (NOx) N:0490

Formula: NO (nitric oxide); NO_2 (nitrogen dioxide); N_2O_3 (nitrogen trioxide); N_2O_4 (dinitrogen tetraoxide); N_2O_5 (nitrogen pentoxide)

Synonyms: Amidogen, OXO-; Mononitrogen monoxide; Monoxyde d'azote (French); Monoxyde d'azote, comprimé (French); Nitric oxide (NO); Nitric oxide trimer; Nitric oxide, compressed; Nitrogen monooxide; Nitrogen monoxide; Nitrogen(II) oxide; Nitrosyl radical; Oxido nítrico (Spanish); Oxido nítrico, comprimido (Spanish); Oxyde nitrique (French); Oxyde nitrique, comprimé (French)

CAS Registry Number: 10102-43-9 (nitric oxide, nitric monoxide); 10544-73-7 (nitrogen trioxide); 10102-03-1 (dinitrogen pentoxide); 10024-97-2 (nitrous oxide)

UN/NA & ERG Number: (PIH) UN1660 (nitric oxide)/124; UN2201(Nitrous oxide, refrigerated liquid)/122; UN2421(Nitrogen trioxide)/124; UN1067 (dinitrogen tetroxide)/124; UN2421 (dinitrogen tetroxide)/124

EC Number: 233-032-0 (nitrous oxide); 233-271-0 9 (nitrogen monoxide); 234-128-5 (dinitrogen trioxide); 233-264-2 (dinitrogen pentaoxide)

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (*commercial grade, nitrogen trioxide*)

Hazard Alert: Poison inhalation hazard: exposure can be lethal, High acute toxicity *(nitrogen trioxide*) See entries for specific compound

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (nitrogen dioxide, nitric oxide, nitrogen tetroxide; nitrogen trioxide).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%, nitrous oxide 10024-97-2

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R27/28; R50/53; safety phrases: S1; S13; S28; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water (for above CAS number except dinitrogen pentoxide; no hazard value assigned).

Description: Nitrogen oxides are colorless (NO, N_2O) to brick red (NO_2) gases. Little or no odor, or an irritating odor (NO_2). When frozen they appear to be white to bluish-white snow. Molecular weight = 30 (*nitric oxide*); 76.01(*nitrogen trioxide*); specific gravity (H_2O:1) = (nitric oxide) 1.23 @ 20°C; (nitrogen tetroxide) 1.04 @ 2°C; boiling point = −152°C (*nitric oxide*); 21°C (*nitrogen dioxide*); 47°C (*nitrogen pentoxide*); freezing/melting point = −163°C (*nitric oxide*); −9°C (*nitrogen dioxide*); 30°C (*nitrogen pentoxide*); −101°C (*Nitrogen tetroxide*); vapor pressure = (nitric oxide) 750 mmHg @ −151°C;. Hazard identification (based on NFPA-704 M Rating System) (*nitric oxide*): Health 4; flammability 0; reactivity 1; (*nitrogen dioxide*) Health 2, flammability 0; reactivity 0. They decompose in water.

Potential Exposure: See entries for specific compound

Incompatibilities: Stability and reactivity is variable depending on specific compound. All are strong oxidizers that enhance the combustion of easily oxidizer materials, reducing agents; combustibles, organics.

Permissible Exposure Limits in Air

nitric oxide; nitrogen dioxide; nitrogen tetroxide
10102-43-9 (nitric oxide, nitric monoxide)
PAC-1: $\mathbf{0.5_A}$ ppm
PAC-2: $\mathbf{12_A}$ ppm
PAC-3: $\mathbf{20_A}$ ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
10024-97-2, nitrous oxide
PAC-1: 910 ppm
PAC-2: 10,000 ppm
PAC-3: 20,000 ppm
10544-73-7, *nitrogen trioxide*
PAC-1: 0.82 ppm
PAC-2: 20 ppm
PAC-3: 33 ppm
See entries for specific compound. The United States Environmental Protection Agency has set national ambient air quality standards for nitrogen oxides of 0.05 ppm (100 μ/m^3) as an annual arithmetic mean value.

Harmful Effects and Symptoms

Short-Term Exposure: Serious health hazards. Corrosive to the eyes and skin. Harmful if inhaled. See "Nitric oxide," "Nitrogen dioxide," etc.

First Aid: If any of these chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with nitrogen oxides all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizable materials. Outside or detached storage is preferred. Do not put on wooden floors. See NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers.*

Shipping: UN1660 Nitric oxide, compressed, Hazard Class: 2.3; Labels: 2.3-Poison Gas, 8-Corrosive material, 5.1-Oxidizer, Inhalation Hazard Zone A. UN2201 Nitrous oxide, refrigerated liquid, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas, 5.1-Oxidizer. UN2421 Nitrogen trioxide, Nitrogen trioxide, Hazard Class: 2.3; Labels: 2.3-Poison Gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A. UN1067 Dinitrogen tetroxide, Hazard Class: 2.3; Labels: 2.3-Poison Gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A. UN2421 Nitrogen trioxide, Hazard Class: 2.3; Labels: 2.3-Poison Gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A.

Spill Handling:
Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft./m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft./m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.5/2.4

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Runoff of less volatile nitrogen oxides may contain nitric acid.

Fire Extinguishing: Nitrogen oxides enhance the activity of an existing fire. This gas is under pressure; containers may rupture and explode when heated. Wearing proper equipment, shut off flow of gas. Use water spray to keep containers cool and to also direct escaping gas away from personnel attempting to shut off leak. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Nitrogen Trifluoride N:0500

Formula: F_3N; NF_3
Synonyms: Nitrogen fluoride; Nitrogen trifluoride, compressed; Perfluoroammonia; Trifluoramine; Trifluorammonia; Trifluoroamine; Trifluoroammonia; Trifluorure d'azote (French); Trifluorure d'azote, comprimé (French); Trifluoruro de nitrógeno (Spanish); Trifluoruro de nitrógeno, comprimido (Spanish) Trifluoramine; Trifluorammonia
CAS Registry Number: 7783-54-2
HSDB Number: 1113
RTECS Number: QX1925000
UN/NA & ERG Number: (PIH) UN2451/122
EC Number: 232-007-1
Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Explosive, Oxidizer (gas), Corrosive (contact with moisture), Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: O; risk phrases: R5; R8; R20; R21; R23/24; safety phrases: S7/8; S9; S17; S23; S33; S38; S41; S45(see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Not hazardous to water (Lit.).

Description: Nitrogen trifluoride is a colorless gas. Moldy odor. Shipped as a nonliquefied compressed gas. Molecular weight = 71.01; specific gravity (H_2O:1) = 1.5 @ −129°C; boiling point = −129°C; freezing/melting point = −209°C; Relative vapor density (air = 1) 2.46 @ 20°C; vapor pressure = >1 atm. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity ₩. Practically insoluble in water (reactive).

Potential Exposure: This material has been used in chemical synthesis and as an oxidizer for high-energy fuels (as an oxidizer in rocket propellant combinations).

Incompatibilities: The gas is a powerful oxidizer. Presents dangerous fire hazard in the presence of reducing agents.

Etches glass in the presence of moisture[101]. Reacts with oil, grease, reducing agents and other oxidizable materials; combustibles, organics, ammonia, carbon monoxide; methane, hydrogen, hydrogen sulfide; activated charcoal; diborane, water. Can react violently with hydrogen, ammonia, carbon monoxide, diborane, hydrogen sulfide, methane, tetrafluorohydrazine, charcoal[101]. Nitrogen trifluoride will increase intensity of an existing fire.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm

Conversion factor: 1 ppm = 2.90 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/29 milligram per cubic meter TWA

NIOSH REL: 10 ppm/29 milligram per cubic meter TWA

ACGIH TLV[1]: 10 ppm/29 milligram per cubic meter TWA; BEIM issued for Methemoglobin inducers.

PAC* Ver. 29[138]

PAC-1: $\mathbf{200}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{530}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{860}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values. United Kingdom: TWA 10 ppm (30 milligram per cubic meter); STEL 15 ppm (44 milligram per cubic meter), 2000; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; the Netherlands: MAC-TGG 29 milligram per cubic meter, 2003. Several states have set guidelines or standards for NF3 in ambient air[60] ranging from 0.3 milligram per cubic meter (North Dakota) to 0.5 milligram per cubic meter (Virginia) to 0.58 milligram per cubic meter (Connecticut) to 0.714 milligram per cubic meter (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Insufficient data are available on the effect of this substance on human health, therefore utmost care must be taken. May be corrosive to eyes, skin and respiratory tract. In animals: anoxia, cyanosis, methemoglobinemia; weakness, dizziness, headache, liver, kidney injury. (NIOSH).

Long-Term Exposure: However, a Japanese source[24] states that NF3 is corrosive to tissue and that teeth and bones are affected on long inhalation. See also, "Fluoride," above.

Points of Attack: Blood, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methhemoglobin; CBC. Liver and kidney function tests. Urine fluoride test (levels above 3−4 mg/L at the end of exposure represent increased exposure).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. No protective devices other than respirators are indicated by NIOSH. rubber gloves, face shield and overalls are suggested by others, however[22]. Specific engineering controls are recommended in NIOSH Criteria Document #76-103: *Inorganic fluorides*.

Respirator Selection: *Up to 100 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *Up to 500 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern];* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SAF(any supplied-air respirator with a full facepiece). *Up to 1000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow Stripe: Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2451 Nitrogen trifluoride, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas; 5.1-Oxidizer. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a nonflammable gas. Thermal decomposition products may include hydrogen fluoride and oxides of nitrogen. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Vent into large volume of concentrated reducing agent (bisulfites, ferrous salts or hypo) solution, then neutralize and flush to sewer with large volumes of water.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).

Hazard Alert: Explosive (unstable), Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction); FDA-proprietary drug. Listed for Tier 1 screening as an endocrine disruptor[88].

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P081

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: E, T+, N; risk phrases: R3; R26/27/28; R33; R51/53; R62; R63; safety phrases: S1/2; S28; S33; S35; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Nitroglycerin is a pale yellow liquid or crystalline solid (below 13°C). Molecular weight = 227.09; specific gravity (H_2O:1) = 1.6 @ 20°C; boiling point = begins to decompose @ 50−60°C; explodes @ 261°C; freezing/melting point = 13.5°C; vapor pressure = 0.0003 mmHg @ 20°C; Flash point = explodes; Autoignition temperature = 261°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 4. Practically insoluble in water.

Potential Exposure: An explosive ingredient in dynamite (20−40%) with ethylene glycol dinitrate (80−60%). It is also used in making other explosives, rocket propellants; and medicine (vasodilator).

Incompatibilities: Heat, ozone, shock, acids. An OSHA Class A Explosive (1910.109). Heating may cause violent combustion or explosion. May explosively decompose on shock, friction, or concussion. Reacts with ozone causing explosion hazard.

Permissible Exposure Limits in Air

NIOSH IDLH = 75 milligram per cubic meter

Conversion factor: 1 ppm = 9.29 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.2 ppm/2 milligram per cubic meter Ceiling Concentration [skin]

NIOSH REL: 0.1 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.05 ppm/0.46 milligram per cubic meter [skin]

PAC Ver. 29[138]

PAC-1: 0.1 ppm

PAC-2: 2 ppm

PAC-3: 75 ppm

DFG MAK: [skin] Carcinogen Category 3B; Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.02 ppm (0.2 milligram per cubic meter) [skin], 1993; Australia: TWA 0.05 ppm (0.5 milligram per cubic meter) [skin], 1993; Austria: MAK 0.05 ppm (0.5 milligram per cubic meter) [skin], 1999; Belgium: TWA 0.05 ppm (0.46 milligram per cubic meter) [skin], 1993; Denmark: TWA 0.02 ppm (0.2 milligram per cubic meter) [skin], 1999; Finland: TWA 0.1 ppm (0.9 milligram per cubic meter); STEL 0.3 ppm (3 milligram per cubic meter) [skin], 1999; France: VME 0.1 ppm (1 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, [skin], 2003; Japan: STEL 0.05 ppm (0.46 milligram per cubic meter) [skin], 1999; Norway: TWA 0.03 ppm (0.27 milligram per cubic meter), 1999; the Phillipines: TWA 0.2 ppm (2 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter; MAC (STEL) 1 milligram per cubic meter, 1999; Russia: STEL 0.5 ppm, 1993; Sweden: NGV 0.03 ppm (0.3 milligram per cubic meter), KTV 0.1 ppm (0.9 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 0.05 ppm (0.5 milligram per cubic meter), KZG-W 0.1 ppm (1 milligram per cubic meter) [skin], 1999; Thailand: TWA 0.2 ppm (2 milligram per cubic meter), 1993; Turkey: TWA 0.2 ppm (2 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 0.2 ppm (1.9 milligram per cubic meter); STEL 0.2 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.05 ppm [skin]. Several states have set guidelines or standards for nitroglycerin in ambient air[60] ranging from 1.67 μ/m^3 (Nevada) to 5.0 μ/m^3 (Florida, North Dakota and South Carolina) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2507. See also OSHA Analytical Method #43.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nitroglycerin can affect you when breathed and by passing through skin. Irritates the eyes. May affect the cardiovascular system and blood, causing lowered blood pressure; circulatory collapse; and interfere with the blood's ability to carry oxygen resulting in cyanosis, the formation of methemoglobin; trouble breathing and even death. Exposure can cause headaches, nausea, and lightheadedness.

Long-Term Exposure: After repeated exposure to nitroglycerin, a marked tolerance develops. Returning to work after a short absence from exposure can cause headaches and other symptoms, and may lead to sudden death. Angina (chest pain) and heart attacks can occur when exposure stops suddenly. Repeated or prolonged contact may cause skin sensitization and allergy.

Points of Attack: Cardiovascular system, blood, skin, central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); Blood Plasm; CBC, electrocardiogram, EKG (immediately, if any chest discomfort is felt). Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #78-187 *Occupational Exposure to Nitroglycerin and Ethylene Glycol Dinitrate.*

Respirator Selection: NIOSH: *Up to 1 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator).* *Up to 2.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 5 milligram per cubic meter:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); * or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 75 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Explosive. Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nitroglycerin must be stored to avoid contact with heat, flames, mechanical shock or ozone, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric). Sources of ignition, such as smoking and open flames are prohibited where nitroglycerin is handled, used, or stored. Nitroglycerin has a special shipping regulation by DOT and therefore requires specific handling procedures. Metal containers involving the transfer of 5 gallons or more of nitroglycerin should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of nitroglycerin. Wherever nitroglycerin is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Nitroglycerin is often found mixed with ethylene glycol dinitrate. Also consult the entry on "Ethylene glycol dinitrate."

Shipping: UN1204 Nitroglycerin solution in alcohol with not >1% nitroglycerin, Hazard Class: 3; Labels: 3-Flammable liquid. UN3064 Nitroglycerin, solution in alcohol with >1% but not >5% nitroglycerin, Hazard Class: 3; Labels: 3-Flammable liquid. UN0143 Nitroglycerin, desensitized with not <40% nonvolatile, water-insoluble phlegmatizer, by mass. It falls in Hazard Class 1.1D (subsidiary hazard: 6.1).

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Do not touch or disturb spilled material. Consult an expert trained for this kind of emergency. Do NOT wash away into sewer (extra personal protection: complete protective clothing including SCBA). It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an explosive and flammable liquid. In case of fire, evacuate area. Combustion in an enclosed space can result in explosion. Isolate area around fire and call for expert help. Consider letting fire burn. Thermal decomposition products may include oxides of nitrogen and carbon. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not wash into sewer. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 400 (commercial grade).

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 2000; NCI: Carcinogenesis Studies (inhalation); clear evidence: mouse, rat.

California Proposition 65 Chemical[102]: Cancer 5/1/1997.

Hazard Alert: Highly flammable, Possible risk of forming tumors,

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg)

Carcinogenicity: (New Jersey)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R5; R11; R22; safety phrases: S1; S2; S21; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Nitromethane is a highly flammable and explosive colorless liquid with a strong, disagreeable odor. Molecular weight = 61.05; specific gravity (H_2O:1) = 1.13 @ 20°C; boiling point = 101°C; freezing/melting point = −29°C; vapor pressure = 28 mmHg @ 20°C; Flash point = 35°C (cc); Autoignition temperature = 417°C. Explosive limits: LEL = 7.3%; UEL: 63%. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 3; reactivity 4 (Possible detonation). Slightly soluble in water.

Potential Exposure: Nitromethane is used in the production of the fumigant, chloropicrin. It is best known as racing car fuel. It is also used as a solvent and as an intermediate in the pharmaceutical industry.

Incompatibilities: May explode from heat, shock, friction, or concussion. Reacts with alkalis, strong acids; metallic oxides. Detonates or reacts violently with strong oxidizers, strong reducing agents such as hydrides; formaldehyde, copper, copper alloys; lead, lead alloys; hydrocarbons and other combustibles, causing fire and explosion hazard. Forms shock sensitive mixture when contaminated with acids, amines, bases, metal oxides; hydrocarbons, and other combustible materials.

Permissible Exposure Limits in Air

NIOSH IDLH = 750 ppm

Conversion factor: 1 ppm = 2.50 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = <200 ppm

OSHA PEL: 100 ppm/250 milligram per cubic meter TWA

NIOSH REL: see *NIOSH Pocket Guide*, Appendix D.

ACGIH TLV[1]: 20 ppm/ 50 milligram per cubic meter TWA, confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 60 ppm
PAC-2: 210 ppm
PAC-3: 1000 ppm
DFG MAK: [skin] Carcinogen Category 3B

Austria: MAK 100 ppm (250 milligram per cubic meter), 1999; Denmark: TWA 100 ppm (250 milligram per cubic meter), 1999; Finland: TWA 100 ppm (250 milligram per cubic meter); STEL 150 ppm (375 milligram per cubic meter), 1999; France: VME 100 ppm (250 milligram per cubic meter), 1999; Norway: TWA 50 ppm (125 milligram per cubic meter), 1999; the Phillipines: TWA 100 ppm (250 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 50 milligram per cubic meter, 2003; Sweden: NGV 20 ppm (50 milligram per cubic meter), KTV 50 ppm (125 milligram per cubic meter), 1999; Switzerland: MAK-W 100 ppm (250 milligram per cubic meter), 1999; Turkey: TWA 100 ppm (250 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (254 milligram per cubic meter); STEL 150 ppm, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for nitromethane in ambient air[60] ranging from 2.5 milligram per cubic meter (North Dakota) to 4.0 milligram per cubic meter (Virginia) to 5.0 milligram per cubic meter (Connecticut) to 5.952 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method(IV) #2527, Nitromethane.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.005 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin and eyes on contact. Inhaling nitromethane irritates the nose and throat causing mild pulmonary irritation with coughing and wheezing. May affect the central nervous system; causing CNS depression, weakness, muscular incoordination; convulsions.

Long-Term Exposure: Repeated or prolonged contact may cause dry and cracked skin. May affect or damage the peripheral nervous system. May cause kidney and liver damage. May cause anorexia, nausea, vomiting and diarrhea.

Points of Attack: Eyes, skin, central nervous system; kidneys, liver.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber; Neoprene, polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *750* ppm*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA). Note: Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator and protect from heat, oxidizers, strong acids; strong bases; formaldehyde, amines, hydrocarbons, combustibles. metallic oxides, reducing agents; copper and its alloys; lead and its alloys, light. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1261 Nitromethane, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well first with alcohol, then with soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Water may be ineffective. Alcohol foam is recommended[17].

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes[22].

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

Hazard symbols, risk, & safety statements:

Description: There are three isomers of nitrophenol. The isomer of greatest concern, and the subject of *ATSDR Toxicology Profile*, is the *p*-isomer (4-nitrophenol). The meta-form is produced from *m*-nitroaniline, and the *o*-and *p*-isomers are produced by nitration of phenol. They are colorless to slightly yellowish crystals with an aromatic to sweetish odor. Molecular weight = (*o-, m-, & p*-isomers) 139.11; specific gravity (H_2O:1) = (*o*-, *m*-& *p*-isomers) 1.5 @ 20°C; boiling point = (*o*-isomer) 215°C; (*m*-isomer) 194°C; (*p*-isomer) 279°C (decomposes); freezing/melting point = (*o*-isomer) 45°C; 97°C (*m*-isomer); (*p*-isomers) 114°C (sublimes); vapor pressure = (*o*-isomer) 1 mmHg @ 49°C; (*m*-isomer) 0.1 mmHg @ 25°C; Flash point = (*o-& m*-isomers) 102°C; (*p*-isomer) 169°C; Autoignition temperature = (*p*-isomer) 283°C. Explosive limits (*m*-isomer) LEL = 73,000 ppm; UEL: unknown. NFPA 704 M Hazard identification (*m*-, *o*-, *p*-): Health 3; flammability 1; reactivity 2. Not soluble in water.

Potential Exposure: (*p*-isomer): Possible risk of forming tumors, Suspected reprotoxic hazard. Nitrophenols are used as intermediates in production of dyes; photochemicals, pesticides, and pharmaceuticals; in leather tanning.

Incompatibilities: Nitrophenols are strong oxidizers. Reacts violently with combustible and reducing agents. Contact with potassium hydroxide forms an explosive mixture. May explode on heating.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

88-75-5, o-isomer

PAC-1: 2.1 milligram per cubic meter

PAC-2: 23 milligram per cubic meter

PAC-3: 140 milligram per cubic meter

554-84-7 *m-isomer*

PAC-1: 2.8 milligram per cubic meter

PAC-2: 31 milligram per cubic meter

PAC-3: 180 milligram per cubic meter

100-02-7 *p-isomer 100-02-7 & mixed isomers*

PAC-1: 0.69 milligram per cubic meter

PAC-2: 7.6 milligram per cubic meter

PAC-3: 46 milligram per cubic meter

Russia set a MAC for 4-nitrophenols in ambient air in residential areas of 0.003 milligram per cubic meter on a once-daily basis. Guidelines for *p*-nitrophenol in ambient air[60] have been set by South Carolina at zero and by New York at 0.03 μ/m^3.

Permissible Concentration in Water: Federal Drinking Water Guidelines (*4-Nitrophenol*): EPA 60 μg/L. State Drinking Water Guidelines (*2-Nitrophenol*): Florida 20 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Percutaneous absorption of liquid.

Harmful Effects and Symptoms

Short-Term Exposure: Nitrophenols can affect you when breathed in and by passing through your skin. Nitrophenols can irritate and burn the skin and eyes with possible eye damage. Vapors can cause irritation of the respiratory tract with coughing and/or shortness of breath. High levels of vapors may cause metabolism increase and rapid heart beat. High levels can lower the ability of the blood to carry oxygen (methemoglobinemia), leading to cyanosis (a bluish color to the skin and lips), headaches, dizziness and collapse. Higher levels can cause death. Exposure can cause headache, upset stomach; dizziness, weakness, confusion, fever, breathing trouble; a slow pulse; fall in blood pressure; convulsions (fits) and death.

Long-Term Exposure: Nitrophenols may damage the kidney and liver. Nitrophenols can irritate the lungs; bronchitis may develop. High or repeated exposure may affect the nervous system.

Points of Attack: Liver, kidneys, blood.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: A blood test for methemoglobin level, liver function tests; kidney function tests; nervous system tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is recommended by a manufacturer and other authorities as a protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to nitrophenols, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Nitrophenols must be stored to avoid contact with reducing agents; oxidizers, combustibles, organic materials; and strong bases, since violent reactions occur. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1663 Nitrophenols (*o-; m-; p-*), Hazard Class: 6.1; Labels: 6.1-Poisonous materials

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration-care must be taken to maintain complete combustion at all times. Incineration of large quantities may require scrubbers to control the emission of nitrogen oxides. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 203-544-9 [*Annex I Index No.:* 609-001-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R20/21/22; R36/37/38; R62; safety phrases: S2; S9; S21; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 1-Nitropropane is a colorless liquid with a mild, fruity odor. Molecular weight = 89.1; specific gravity (H_2O:1) = 1.01; boiling point = 131°C; freezing/melting point = −108°C; vapor pressure = 7.5 mmHg @ 20°C; Flash point = 35.6°C (cc); Autoignition temperature = 421°C. Explosive limits: LEL = 2.2%; UEL-unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 2. Slightly soluble in water; solubility = 1%. *Note:* Technical products measurably contaminated with 2-Nitropropane.

Potential Exposure: 1-Nitropropane is used as a solvent for polymers, as a stabilizer; and in organic synthesis. *Note:* Technical products measurably contaminated with 2-Nitropropane, see also 2-Nitropropane (N: 0550)

Incompatibilities: 1-Nitropropane, a nitroparaffinin, forms exposive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, reducing agents; nitrates, amines, hydrocarbons, and other combustible materials; metal oxides. May explode on heating.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm [LEL]
Odor threshold = 140 ppm.
OSHA PEL: 25 ppm/90 milligram per cubic meter TWA
NIOSH REL: 25 ppm/90 milligram per cubic meter TWA
ACGIH TLV[1]: 25 ppm/91 milligram per cubic meter TWA, not classifiable as a human carcinogen.
PAC Ver. 29[138]
PAC-1: 75 ppm
PAC-2: 380 ppm
PAC-3: 2300 ppm
DFG MAK: 25 ppm/1992 milligram per cubic meter TWA; Peak Limitation Category I(4); Pregnancy Risk Group D

Austria: MAK 25 ppm (90 milligram per cubic meter), 1999; Denmark: TWA 5 ppm (18 milligram per cubic meter), 1999; Finland: TWA 25 ppm (90 milligram per cubic meter); STEL 40 ppm (150 milligram per cubic meter), 1999; France: VME 25 ppm (90 milligram per cubic meter), 1999; Norway: TWA 20 ppm (70 milligram per cubic meter), 1999; the Phillipines: TWA 25 ppm (90 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 90 milligram per cubic meter, 2003; Switzerland: MAK-W 5 ppm (18 milligram per cubic meter), carcinogen, 1999; Turkey: TWA 25 ppm (90 milligram per cubic meter), 1993; United Kingdom: TWA 25 ppm (93 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for 1-nitropropane in ambient air[60] ranging from 0.3 milligram per cubic meter (New York) to 0.9 milligram per cubic meter (Florida and North Dakota) to 1.5 milligram per cubic meter (Virginia) to 1.8 milligram per cubic meter (Connecticut) to 2.143 milligram per cubic meter (Nevada) to 2.25 milligram per cubic meter (South Carolina).

Determination in Air: Use OSHA Analytical Method 46.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing, wheezing, and/or shortness of breath. High levels can interfere with the ability of the blood to carry oxygen (methemoglobinemia), causing cyanosis, headaches, fatigue, dizziness nausea, vomiting, diarrhea. Higher levels can cause collapse and death.

Long-Term Exposure: In animals: liver, kidney damage.

Points of Attack: Eyes, central nervous system; liver, kidneys.

Medical Surveillance: Liver and kidney function tests. Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber; Teflon, and Silvershield are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 250 ppm:* Sa (APF = 10) (any supplied-air respirator).* *Up to 625 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). **Up to 1000 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied air respirator with a full facepiece).

Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist.

Shipping: UN2608 Nitropropanes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, T; risk phrases: R45; R11, R45; R10; R20/22; R62; R63; safety phrases: S21; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 2-Nitropropane is a colorless liquid. Molecular weight = 89.1; specific gravity (H_2O:1) = 0.99; boiling point = 120°C; freezing/melting point = −91°C; vapor pressure = 13 mmHg @ 20°C; 7.5 mmHg @ 10.7°C; Flash point = 23.9°C; Autoignition temperature = 428°C. Explosive limits: LEL = 2.6%; UEL: 11.0%. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 3; reactivity 2. Slightly soluble in water; solubility = 2%.

Potential Exposure: 2-Nitropropane is used as a solvent for polymers, organic compounds; cellulose, esters; gums, vinyl resins; waxes, epoxy resins, fats, dyes, and chlorinated rubber; as a stabilizer. Its combustion properties have made it useful as a rocket propellant and as a gasoline and diesel fuel additive. 2-Nitropropane also has limited use as a paint and varnish remover. It serves as an intermediate in organic synthesis of some pharmaceuticals; dyes, insecticides, and textile chemicals.

Incompatibilities: 1-Nitropropane, a nitroparaffin compound, forms explosive mixture with air. Contact with heavy metal oxides may cause decomposition. Mixtures with hydrocarbons are extremely flammable. Attacks some plastics, rubber and coatings. May explode on heating. Violent reaction with strong bases; strong acids and metal oxides. Shock-sensitive compounds are formed with acids, amines, inorganic bases and heavy metal oxides. Incompatible with strong oxidizers, combustible materials. 2-Nitropropane reacts with activated carbon causing decomposition. *This reaction may occur in activated carbon respirator filters.*

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm
Odor Threshold = 300 ppm.
OSHA PEL: 25 ppm/90 milligram per cubic meter TWA
NIOSH REL:A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV[1]: 10 ppm/36 ppm TWA, confirmed animal carcinogen with unknown relevance to humans.
PAC Ver. 29[138]
PAC-1: 30 ppm
PAC-2: 380 ppm
PAC-3: 2300 ppm
DFG MAK: [skin] Carcinogen Category 2

Austria carcinogen, 1999; Denmark: TWA 5 ppm (18 milligram per cubic meter), 1999; France: carcinogen, 1993; Norway: TWA 10 ppm (35 milligram per cubic meter), 1999; the Phillipines: TWA 25 ppm (90 milligram per cubic meter), 1993; Sweden: NGV 5 ppm (18 milligram per cubic meter), TGV 10 ppm (35 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.036 milligram per cubic meter, 2003; Turkey: TWA 25 ppm (90 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (19 milligram per cubic meter), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Brazil [35] has set a TWA of 20 ppm (70 milligram per cubic meter). Several states have set guidelines or standards for 2-nitropropane in ambient air[60] ranging from zero in North Dakota to 0.2 μ/m^3 (Rhode Island) to 21.67 μ/m^3 (Pennsylvania) to 350 μ/m^3 (Virginia) to 360 μ/m^3 (Connecticut) to 2143 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2528; OSHA Analytical Method 46 (which supercedes Method 15).

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 0.9$.Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The vapor irritates the eyes and respiratory tract. 2-Nitropropane can affect you when breathed in. 2-Nitropropane may cause mutations. Handle with extreme caution. Exposure can cause headaches, dizziness, nausea, vomiting, and diarrhea. At levels, causing these symptoms, severe liver damage can occur that can cause death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure may also damage the kidneys, heart, and may interfere with the ability of the blood to carry oxygen (methemoglobinemia); this can cause weakness, trouble breathing and cyanosis, a bluish color to the skin and lips. Exposure to high levels may cause liver damage. Exposure to very high levels may result in death.

Long-Term Exposure: May affect the liver, kidneys, heart, and nervous system. Based on animal tests, this chemical is a potential occupational carcinogen. Animal tests show that this substance may cause mutations and affect human reproduction.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys, liver, heart. Cancer site in animals: liver tumors.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber; and polyvinyl chloride are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Nitropropane must be stored to avoid contact with strong bases and strong acids (such as hydrochloric, sulfuric, and nitric) and metal oxides; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of 2-nitropropane. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2608 Nitropropanes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes[22]. Dilute with pure kerosene and burn with care as it is potentially explosive. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: *N*-Nitrosodi-*n*-butylamine is a yellow, oily liquid. Molecular weight = 158.28; boiling point = 235°C; 116°C @ 14 mm. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 0; reactivity 0. Slightly soluble in water.

Potential Exposure: *N*-Nitrosodi-*n*-butylamine is a carcinogenic nitrosamine. It is found or used in various manufacturing industries, including chemical, rubber, metal, etc., and in research.

Incompatibilities: *N*-Nitrosodi-*n*-butylamine is light sensitive. Nitrosamines can be strong oxidizers; contact with these materials may cause fires or explosions. Keep away from combustible materials, alkaline materials, strong acids, strong bases. Nitrated organics range from slight to strong oxidizing agents. If mixed with reducing agents, including hydrides, sulfides and nitrides, they may begin a vigorous reaction. Amines are a chemical base: will neutralize acids to form salts plus water with an exothermic reaction. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated by amines in combination with strong reducing agents such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Exposure Limits in Air

DFG MAK: [skin] Carcinogen Category 2

There is no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 38.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 2.6. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation; dermal contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: *N*-Nitrosodi-*n*-butylamine irritates the skin and respiratory tract. Nitrosamines can cause headaches, abdominal cramps; weakness and dizziness. It is unknown if this chemical causes all of these same symptoms.

Long-Term Exposure: May be a human carcinogen; causes urinary bladder, esophagus, and liver cancer in animals. This chemical is toxic to the fetus and causes fetal death in animals. Repeated exposure may cause liver damage.

Points of Attack: Liver, bladder.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Under 40 CFR 261.5 small quantity generators of this waste may qualify for partial exclusion from hazardous waste regulations.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: *N*-Nitrosodiethylamine is a yellow liquid. Molecular weight = 102.16; boiling point = 175−177°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0. Soluble in water.

Potential Exposure: An additive in gasoline and lubricants; an antioxidant and stabilizer in plastics. Used in research.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with reducing agents may form hydrazine; hydrogen bromide. Light sensitive; rapidly decomposes.

Permissible Exposure Limits in Air

PAC not available. There is no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

DFG MAK: [skin] Carcinogen Category 2

Determination in Air: Use NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 38.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the skin and eyes. The vapors cause respiratory tract irritation. Some related nitrosamines can cause headaches, abdominal cramps; weakness and dizziness. It is unknown if this chemical causes all of these same symptoms.

Long-Term Exposure: Potential human carcinogen.

Prolonged or repeated exposure may cause liver damage. May damage the developing fetus.

Points of Attack: Liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Plastic, latex, or Neoprene gloves, may be effective protection. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dark, well-ventilated area away from light, oxidizers, reducing agents; hydrogen bromide. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R25; R26; R45; R48/25; R50/53; R62; R63; safety phrases: S45; S48/25; S51/53; S53; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: *N*-Nitrosodimethylamine is a yellow oily liquid. Faint, characteristic odor. Molecular weight = 74.08; specific gravity (H_2O:1) = 1.01 @ 20°C; boiling point = 152°C; vapor pressure = 7.5 mmHg @ 37°C; Flash point = 61°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 1. Soluble in water.

Potential Exposure: Nitrosodimethylamine was formerly used in the production of rocket fuels. Presently used as an antioxidant; as an additive for lubricants and as a softener of copolymers. It is used as an intermediate for 1,1-dimethylhydrazine.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, especially peracids strong bases. Sensitive to UV light. Should be stored in dark bottles.

Permissible Exposure Limits in Air

IDLH = Not determined, Potential occupational carcinogen.

OSHA PEL: Cancer suspect agent. Exposure of workers to this chemical is to be controlled through the required use of engineering controls, work practice; and personal protective equipment, including respirators. See 29CFR1910.1003.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration

ACGIH TLV[1]: Exposures by all routes should be carefully controlled to levels as low as possible. [skin] confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 0.082 milligram per cubic meter

PAC-2: 0.9 milligram per cubic meter

PAC-3: 10 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2

Austria: carcinogen, 1999; France: carcinogen, 1993; Switzerland: MAK-W 0.001 milligram per cubic meter, carcinogen, 1999; United Kingdom: carcinogen, 2000; the Netherlands: MAC-TGG 0.001 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans.

Determination in Air: Use NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 38.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA: The levels for *N*-nitrosodimethylamine through ingestion of contaminated water and contaminated aquatic organisms which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 14 ng/L, 1.4 ng/L, and 0.14 ng/L, respectively. For consumption of aquatic organisms only, excluding consumption of water, the levels are 160,000 ng/L, 16,000 ng/L, and 1600 ng/L, respectively. State Drinking Water Guidelines: California 0.01 μg/L; Florida 7.5 μg/L; Massachusetts 0.01 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with nitrogen-phosphorus or reductive Hall detectors (EPA Method 607); or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log K_{ow} = – negative. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Symptoms of exposure include nausea, vomiting and malaise. Extremely high toxicity. The lowest lethal oral dose in humans has been reported @ 10 mg/kg/80 week intermittent exposure.

Long-Term Exposure: Chronic exposure may cause liver disease with jaundice and swelling with low platelet count; cirrhosis. The effects may be delayed. Based on animal tests, this substance may be a potential carcinogen in humans.

Points of Attack: Liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. OSHA mandates the following tests: increased risk: reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking. NIOSH lists the tests: *increased risk*: reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; liver function tests; pulmonary function tests. Based on human experience and on animal studies, preplacement and periodic examinations should include a history of exposure to other carcinogens, alcohol and smoking habits; medications, and family history. Special attention should be given to liver size and function, and to any changes in lung symptoms or X-rays. Renal function should be followed. Sputum and urine cytology may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for because the symptoms of jaundice may be delayed. Keep victim quiet and maintain normal body temperature.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). See also Appendix E *NIOSH Pocket Guide*.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator in brown bottles, and protect from oxidizers and prolonged exposure to light. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. PG I.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft./m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.2/0.3

Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 1000/300

Then: Protect persons downwind (mi/km)

Day 1.1/1.8

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in celite, vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour over soda ash, neutralize with HCl, then flush to drain with large volumes of water. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *N*-Nitrosodiphenylamine is a yellow to orange-brown crystalline solid. Molecular weight = 198.24; specific gravity (H_2O:1) = 1.23 @ 20°C; boiling point = 268°C (estimated); freezing/melting point = 67°C. Hazard identification (based on NFPA-704 M Rating System): Health 1; flammability 2; reactivity 0. Slightly soluble in water.

Potential Exposure: *N*-Nitrosodiphenylamine is not a naturally occurring substance; it is a man-made chemical that is no longer produced in the United States. It was used in the manufacture of plastics, resins, rubber and synthetic textiles; to help control processes involved in making rubber products, such as tires and mechanical goods; however, in the early 1980s, the United States manufacturers stopped producing *N*-nitrosodiphenylamine because new and more efficient chemicals were found to replace its uses. In addition, the use of *N*-nitrosodiphenylamine had several undesirable side effects which do not occur with the replacement chemicals.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 5.5 milligram per cubic meter

PAC-2: 60 milligram per cubic meter

PAC-3: 360 milligram per cubic meter

DFG MAK: Carcinogen Category 3 B

There is no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 23 or 38.

Permissible Concentration in Water:State Drinking Water Guidelines: Kansas 71.0 μg/L, and Minnesota 71.1 μg/L. Russia set a MAC in surface water of 0.1 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Information is not available regarding effects of brief exposures to *N*-nitrosodiphenylamine on human health. Very little is known about the health effects of brief exposures to *N*-nitrosodiphenylamine in experimental animals, other than that relatively high doses by ingestion are required to produce death. It is not known if exposure to *N*-nitrosodiphenylamine by breathing or skin contact can affect the health of humans or animals, but, because ingestion of *N*-nitrosodiphenylamine has been shown to have adverse health effects in animals. Exposure of humans to *N*-nitrosodiphenylamine should be minimized.

Long-Term Exposure: Long-term exposure of experimental animals to *N*-nitrosodiphenylamine by ingestion produced inflammation and cancer of the bladder. It is not known whether these effects or birth defects would occur in humans if they were exposed to *N*-nitrosodiphenylamine.

Points of Attack: Cancer site in animals: bladder.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Although the presence of the chemical in blood and urine can be detected by chemical analysis, this analysis has not been used as a test for human exposure or to predict potential health effects.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere for prolonged storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep:[52] remove all sources of ignition and dampen spilled material with 60−70% acetone to avoid airborne dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent paper dampened with 60−70% acetone to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Burn in admixture with flammable solvent in furnace equipped with afterburner and scrubber[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: TKB is a black powder or a green plate-like material with a bluish luster. Molecular weight = 198.2; freezing/melting point = 145°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Slightly soluble in water.

Potential Exposure: Used as a chemical intermediate for dyes and pharmaceuticals; in making monomers; and vulcanizing rubber.

Incompatibilities: Nitrated organics range from slight to strong oxidizing agents. If mixed with reducing agents, including hydrides, sulfides and nitrides, they may begin a vigorous reaction. Reaction with aliphatic amines can release carcinogenic nitrosamines. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. 4-nitrosodiphenylamine neutralizes acids in exothermic reactions to form salts plus water. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. May generate hydrogen, a flammable gas, in combination with strong reducing agents such as hydrideds and active metals. May react with strong oxidizing agents[101].

Permissible Exposure Limits in Air

This chemical is a potential occupational carcinogen and all exposure should be reduced to the lowest possible level.

PAC Ver. 29[138]

PAC-1: 0.58 milligram per cubic meter

PAC-2: 6.4 milligram per cubic meter

PAC-3: 39 milligram per cubic meter

Determination in Air: Use NIOSH IV; Method #2522; OSHA Analytical Method 38.

Permissible Concentration in Water: Russia set a MAC in surface water of 0.1 mg/L. Two states have set guidelines for nitrosodiphenylamine in drinking water[60]. They are Kansas @ 71.0 μg/L, and Minnesota @ 71.1 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eyes. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause eye irritation.

Long-Term Exposure: There is limited evidence that this chemical causes bladder cancer in animals.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft.(NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R22; R50/53; R62; safety phrases: S53; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: *N*-nitrosodi-*N*-propylamine is a yellow liquid. Molecular weight = 130.22; boiling point = 206°C; freezing/melting point = 144°C. Explosive limits: LEL = 22,000 ppm; UEL: unknown. Slightly soluble in water.

Potential Exposure: *N*-nitrosodi-*N*-propylamine is used in the manufacture of plastics, resins, rubber, and synthetic textiles. There is no evidence that *N*-nitrosodi-*N*-propylamine exists naturally in soil, air, food, or water. Small quantities of *N*-nitrosodi-*N*-propylamine are inadvertently produced during some manufacturing processes; as an impurity in some commercially available dinitroaniline based weed killers, and during the manufacture of some rubber products. However, according to Sax, some similar *N*-nitroso compounds are formed in the environment and absorbed from precursors in food, water, or air; from tobacco; and from naturally occurring compounds.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Sensitive to UV light.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 5.6 milligram per cubic meter

PAC-2: 62 milligram per cubic meter

PAC-3: 95 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2

There is no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 38.

Routes of Entry: *N*-nitrosodi-*N*-propylamine can enter the body by breathing air that contains *N*-nitrosodi-*N*-propylamine or by eating food or drinking water contaminated with *N*-nitrosodi-*N*-propylamine. *N*-Nitrosodi-*N*-propylamine is not likely to get into your body unless you eat certain foods or drink alcoholic beverages, or are exposed to it at a waste disposal site by breathing *N*-nitrosodi-*N*-propylamine vapors. It is not known whether *N*-nitrosodi-*N*-propylamine can enter the body by direct skin contact with wastes, pesticides, or soil containing *N*-nitrosodi-*N*-propylamine. Experiments with animals suggest that if *N*-nitrosodi-*N*-propylamine enters the body, it will be broken down into other compounds and will leave the body in the urine.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. The effects of brief or long-term exposures to *N*-nitrosodi-*N*-propylamine on human health have not been studied in depth. Little is known about the health effects of brief exposures to *N*-nitrosodi-*N*-propylamine in experimental animals except that eating or drinking certain amounts of this chemical can cause liver disease and death.

Long-Term Exposure: Long-term exposure of experimental animals to *N*-nitrosodi-*N*-propylamine in food or drinking water produces cancer of the liver, esophagus, and nasal cavities. Although human studies are not available, the animal evidence indicates that it is reasonable to expect that exposure to *N*-nitrosodi-*N*-propylamine by eating or drinking could cause liver disease and cancer in humans. It is not known whether other effects, such as birth defects, occur in animals or could occur in humans if they were exposed to *N*-nitrosodi-*N*-propylamine by eating or drinking.

Points of Attack: Liver.

Medical Surveillance: The presence of *N*-nitrosodi-*N*-propylamine in blood and urine can be detected by chemical analysis, but this analysis is not routinely available and has not been used as a test for human exposure or to predict potential health effects. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *N*-Nitrosodi-*N*-propylamine may be destroyed by high temperature incineration in an incinerator equipped with an nitrogen oxide scrubber. Chemical treatment methods may also be used to destroy *N*-nitrosodi-*N*-propylamine. These methods involve (a) denitrosation by reaction with 3% hydrobromic acid in glacial acetic acid; (b) oxidation by reaction with potassium permanganate-sulfuric acid; or (c) extraction of the nitrosamine from the waste using dichloromethane and subsequent reaction with triethyloxonium tetrafluoroborate (TOEF). Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: *N*-Nitroso-*N*-ethyl urea is a pale yellow, crystalline powder; freezing/melting point = 103−104°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 1; reactivity 0₩. Soluble in water; hydrolysis produces explosive gas.

Potential Exposure: Used as a chemical intermediate for dyes and pharmaceuticals; a polymerization inhibitor during the manufacture of vinyl monomers such as styrene; a precursor of diazoethane; accelerator for rubber vulcanization. Used

Incompatibilities: *N*-nitroso-*N*-ethylurea is highly reactive. Sensitive to moisture and light. Its stability in aqueous solutions is pH-dependent. Incompatible with water and nucleophilic reagents. Alkaline hydrolysis produces a highly explosive gas[NTP, 1992]. This compound is extremely unstable at high pH. It will decompose to extremely unstable decomposition products if acidic conditions are not maintained[101]. Nitrated organics range from slight to strong oxidizing agents. If mixed with reducing agents, including hydrides, sulfides and nitrides, they may begin a vigorous reaction. Reaction with aliphatic amines can release carcinogenic nitrosamines.

Determination in Air:

No OELs have been established. However this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

DFG MAK: [skin]

Determination in Water: Octanol-water coefficient: Log $K_{ow} = <1.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause irritation of the eyes and skin. Inhalation can cause respiratory tract irritation. Higher exposure can cause headache, drowsiness, fatigue, weakness, and loss of appetite.

Long-Term Exposure: A potential occupational carcinogen. This chemical has been shown to be a teratogen in animals. High or repeated exposure may cause liver damage. Animal studies involving high or repeated exposures have found effects on the liver, lungs, kidneys and heart.

Points of Attack: Liver. Depending on exposure history, possibly the lungs, heart, and kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests. Possibly tests on lungs, heart, and kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. A Class I, Type B, biological safety hood should be used for handling and mixing in a laboratory environment. Specific engineering controls are required for drug manufacture by the Food and Drug Administration. See 21CFR210.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer this material from storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon; products may be explosive[101]. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: *N*-Nitrosomethylvinylamine is a yellow liquid. Molecular weight = 86.11. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0. Decomposes in water.

Potential Exposure: This chemical is not manufactured but occurs as a chemical reaction byproduct found in the dye, automotive, rubber, and leather industries.

Incompatibilities: Light sensitive. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. A nitrated amine. Amines are combustible. Azo, diazo, azido compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides[101].

Permissible Exposure Limits in Air

PAC not available. There is no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

DFG MAK: [skin]

Determination in Air: NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 38.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skins. Some related nitrosamines can cause headaches, abdominal cramps; weakness and dizziness. It is unknown if this chemical causes all of these same symptoms.

Long-Term Exposure: A potential occupational carcinogen. Has been shown to be a teratogen in animals. May cause liver and kidney damage.

Points of Attack: Liver and kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. However, storage is not likely. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, light. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: *N*-Nitrosopiperidine is a clear, yellow, oily liquid. Molecular weight = 114.17; boiling point = 217°C; Flash point = 93°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0. Soluble in water.

Potential Exposure: *N*-Nitrosopiperidine is found in some foods and tobacco smoke. Used as a research chemical.

Incompatibilities: Nitrated organics range from slight to strong oxidizing agents. If mixed with reducing agents, including hydrides, sulfides and nitrides, they may begin a vigorous reaction. Reaction with aliphatic amines can release carcinogenic nitrosamines. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Light and UV may cause decomposition.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: [skin] Carcinogen Category 2

There is no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH IV; Method #2522; OSHA Analytical Method 38.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can irritate and may cause permanent damage to the eyes; inflammation in the pigmented area and damage to the cornea with clouded patches of vision.

Long-Term Exposure: A potential carcinogen. Prolonged exposure may cause liver damage.

Points of Attack: Eyes, liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Examination of the eyes. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: *N*-Nitrosopyrrolidine is a yellow liquid. Molecular weight = 100.14; boiling point = 105°C @ 20 mm; Flash point = 83°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 2; reactivity 0. Soluble in water.

Potential Exposure: *N*-Nitrosopyrrolidine is a cyclic nitrosamine and a research chemical. Not commercially produced in the U.S.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC not available. There is no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

DFG MAK: [skin] Carcinogen Category 2

Determination in Air: Use NIOSH IV; Method #2522; OSHA Analytical Method 38.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = <1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the skin and eyes. Harmful if swallowed.

Long-Term Exposure: A potential occupational carcinogen. May cause damage to the liver and kidneys. Implicated in human colon cancer

Points of Attack: Liver, kidneys, colon.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Yellow to reddish liquid or yellow/red gas. Choking odor. Liquefies at −5.5°C. Molecular weight = 65.46[136]; specific gravity (water = 1): 1.1571 @ 20°C; 1.36 @ −5.7°C[136]; 1.350 @ 30°C[138]; boiling point @ 1 atm = − 5.8°C[136]; −6.4°C[138]; freezing/melting point = −58.9°C[136]; Critical temperature: (estimate) 899.2 °F/481.8°C/754.9 °K; Critical pressure: (estimate) 611.8 psia = 41.6 atm = 4.22 MN/m^2; Liquid surface tension: 39.07 dynes/cm = 0.03907 N/m @ 40°C; Liquid water interfacial tension: 34.9 dynes/cm = 0.0349 N/m @ 40°C. Relative vapor density (air = 1) = 4.73; Ratio of specific heats of vapor (gas): (GAS): (estimate) $>$ 1; Latent heat of vaporization: (estimate) at boiling point-155.3 Btu/lb = 86.3 cal/g = 3.61×10^5 J/kg; Heat of combustion: (estimate) −11232 Btu/lb = −6240 cal/g = -261.1×10^5 J/kg; vapor pressure: 0.12 mmHg; Flash point: 106°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 1. Special Notice (White): OXY; ₩ Liquid sinks and mixes with water; reacts, forming a poisonous visible vapro cloud of hydrochloric acid and toxic red oxides of nitrogen.

Potential Exposure: A nitrocompound used as a reagent, catalyst, bleaching agent, and intermediate for making other chemicals.

Incompatibilities: Dissolves into and reacts with moisture in the air or with water forming hydrochloric acid and toxic red oxides of nitrogen. Nitrosyl chloride is a strong oxidizer. Violent reaction with strong acids, alkalis (e.g., sodium hydroxide), ammonia, amines, reducing agents, other strong oxidizers. Elevated temperature may cause explosive decomposition. Dissociates into nitric oxide and chlorine on heating. Corrosive to most metals. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air:

PAC Ver. 29[138]

PAC-1: 0.014 ppm

PAC-2:0.15 ppm

PAC-0.9 ppm

Routes of Entry: Inhalation, dermal contact

Harmful Effects and Symptoms

Short-Term Exposure: Gas is highly poisonous and intensely irritating and corrosive. Breathing the vapor can kill you. Skin or eye contact causes severe burns, impaired vision, and possible blindness. Inhalation causes severe irritation of respiratory tract and damage to mucous membranes. Labored breathing, sore throat. Delayed effects, which include severe pulmonary edema and possible hemorrhage, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. DOE description: Eye irritant, severe; Respiratory toxin, acute effects other than severe or moderate irritation; Respiratory irritant, acute, severe, or moderate but not mild irritant effects; Skin irritant, severe.

Long-Term Exposure: repeated or prolonged contact may cause skin, eye, or respiratory problems.

Points of Attack: Lungs, skin, eyes.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following If symptoms develop or overexposure is suspected, chest X-ray must be considered.

First Aid: First Aid: Move victim to fresh air. Call 911 or emergency medical service. *Inhalation*: remove victim to fresh air; call a doctor; enforce complete rest until doctor arrives; observe at least 24 hours for delayed effects. *Skin or eyes*: flush with water for at least 15 minutes. Immediately call a physician and be prepared to transport the victim to a hospital even if no symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire. SCBA (approved mask may be used for short exposures only); rubberized clothing; gloves; shoes; chemical goggles.

Respirator Selection: *20 ppm:* SA* (any supplied-air respirator). *50 ppm:* SA:CF* (any supplied-air respirator operated in a continuous-flow mode). *100 ppm:* SAT:CF* (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (any SCBA with a full facepiece); or SAF (any supplied-air respirator with a full facepiece). *200 ppm:* SAF: PD,PP (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *EMERGENCY OR PLANNED ENTRY INTO UNKNOWN CONCENTRATIONS OR IDLH CONDITIONS:* SCBAF: PD,PP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SAF: PD,PP:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *ESCAPE:* GMFOVHiE [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having a high-efficiency particulate filter]; or SCBAE (any appropriate escape-type, SCBA). **Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with nitrogen oxides all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizable materials. Outside or detached storage is preferred. Do not put on wooden floors. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1069 Nitrosyl chloride, Hazard Class: 2.3; Labels 2.3-Poisonous gas, 8-Corrosive material; Inhalation Hazard Zone C

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft./m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 2000/600
Then: Protect persons downwind (mi/km)
Day 2.3/3.7
Night 5.9/9.5

Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire. Do not touch or walk through spilled material. Stop leak if you can do it without risk. If possible, turn leaking containers so that gas escapes rather than liquid. Prevent entry into waterways, sewers, basements or confined areas. Do not direct water at spill or source of leak. Notify local health and wildlife officials. Use water spray to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material. Isolate area until gas has dispersed. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Harmful to aquatic life in very low concentrations. May be dangerous if it enters nearby water intakes; notify operators.

Fire Extinguishing: Thermal decomposition products may include toxic nitric oxide and chlorine; hydrogen chloride and nitrogen oxides. Strong oxidizer which may react spontaneously with low flash point organics or reducing agents. Heat forms oxygen that will increase the activity of an existing fire. May cause fire or explosion on contact with combustibles (wood, paper, oil, clothing, etc.). Containers may BLEVE when exposed to fire. Do not put yourself in danger by entering a contaminated area to rescue a victim. Wearing proper equipment, shut off flow of gas. Use water spray to keep containers cool and to also direct escaping gas away from personnel attempting to shut off leak. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen(*o*-isomer)

California Proposition 65 Chemical[102]: Cancer 5/15/1998

(*m*-isomer) IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1996; NTP; NCI: Carcinogenesis Studies (feed); clear evidence: mouse, rat; NTP: Carcinogenesis studies; on test (2-year studies), October 2000; (*p*-isomer) IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1996; NCI: Carcinogenesis Studies (feed); equivocal evidence: rat; test completed (peer review), October 2000.

Hazard Alert: Poison, (*all* isomer) Poison, Combustible, Endocrine disruptors (low), Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard

all isomers:

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. all isomers.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R46; R22; R62; R50/53; R61; R62; R63; safety phrases: S29/35; S51/53 S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (all isomers)

Description: Nitrotoluene is formed in 3 isomeric forms. The *o*-and *m*-forms are yellow liquids or solids. The *p*-form is a pale yellow crystalline solid. All have weak aromatic odors. The Odor Thresholds are: 0.05 mg/L (*o*-isomer); 1.74 ppm (*m*-isomer). Molecular weight = 137.15 (all isomers); specific gravity (H_2O:1) = 1.16 @ 15°C (*m-& o*-isomers); 1.14 @ 75°C (*p*-isomer) noiling point = 222°C (*o*-isomer); 232°C (*m*-isomer); 238° (*p*-isomer); freezing/melting point = −10°C (*o*-isomer); 16°C (*m*-isomer); 52°C (*p*-isomer); vapor pressure = 1 mmHg @50°C (*o*-isomer); 0.27 mmHg @ 25°C (*m*-isomer); 0.164 mmHg @ 25°C (*p*-isomer); Flash point = 101-106°C (all isomers). Explosive limits: LEL = 2.2; UEL-unknown. Hazard identification (based on NFPA-704 M Rating System): (*all*-isomers) Health 3; flammability 1; reactivity 1. Insoluble in water.

Potential Exposure: The nitrotoluenes are used in the production of toluidines and other dye intermediates. All isomers are used in manufacture of agriculture and rubber chemicals and in various dyes.

Incompatibilities: Decomposes on contact with strong oxidizers; strong acids; reducing agents; strong bases; ammonia, amines producing toxic fumes, causing fire and explosion hazard. Heat above 190°C may cause explosive decomposition. Attacks some plastics, rubbers, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm

Australia: TWA 2 ppm (11 milligram per cubic meter) [skin], 1993; Austria: MAK 2 ppm (11 milligram per cubic meter) [skin], 1999; Belgium: TWA 2 ppm (11 milligram per cubic meter) [skin], 1993; Denmark: TWA 2 ppm (12 milligram per cubic meter), 1999; Norway: TWA 1 ppm (5.5 milligram per cubic meter), 1999; Poland: MAC (TWA) 3 mg/m^4; MAC (STEL) 9 milligram per cubic meter, 1999; Sweden: NGV 1 ppm (6 milligram per cubic meter), KTV 2 ppm (11 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 2 ppm (11 milligram per cubic meter), KZG-W 4 ppm (22 milligram per cubic meter) [skin], 1999; United

Kingdom: TWA 5 ppm (29 milligram per cubic meter); STEL 10 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 ppm [skin]. In addition, Several states have set guidelines or standards for *p*-nitrotoluene in ambient air[60] ranging from 5.5 μ/m^3 (South Carolina) to 36.7 μ/m^3 (New York) to 110.0 μ/m^3 (Florida). Further, several states have set guidelines or standards for *m*-nitrotoluene in ambient air[60] ranging from 37.0 μ/m^3 (New York) to 110.0 μ/m^3 (North Dakota) to 220.0 μ/m^3 (Connecticut) to 262.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2005, Nitrobenzenes.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 414 μg/L based on health effects.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.3-2.5$ (all isomers). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing and wheezing. Exposure can cause headache, flushing of the skin; rapid heartbeat; nausea, vomiting, weakness, irritability, convulsions, coma and death. High levels may affect the blood, causing formation of methemoglobinemia. Symptoms include anoxia, cyanosis, headache, weakness, dizziness, ataxia, dyspnea (breathing difficulty), tachycardia, vomiting.

Long-Term Exposure: May damage the liver, kidneys, and blood; anemia may develop. May cause damage to the testes.

Points of Attack: Blood, skin, gastrointestinal tract; cardiovascular system; central nervous system; liver, kidneys.

Medical Surveillance: NIOSH lists the following tests (all isomers): whole blood (chemical/metabolite), Methhem oglobin; CBC; urinalysis (chemical/metabolite). Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For *p*-nitrotoluene, Butyl rubber and polycarbonate are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *20 ppm:* Sa (APF = 10) (any supplied-air respirator); or SCBA (any SCBA). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *100 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *200* ppm*:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from combustibles, reducing agents; strong oxidants, strong bases; strong acids. Where possible, automatically transfer materials from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1664 Nitrotoluenes, (o-; m-; p-), Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. With the solid (*p*-isomer) isomer, dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals aor combustible solids. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *Liquid:* This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration-care must be taken to maintain complete combustion at all times. Incineration of large quantities may require scrubbers to control the emission of nitrogen oxides.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R40; R23/24/25;52/53; safety phrases: S1/2; S28; S29/35; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 5-Nitro-*o*-toluidine is a yellow, crystalline solid. Molecular weight = 152.17; freezing/melting point = 107°C; vapor pressure = 1.3×10^{-6} mmHg @ 20°C. Explosive limits: LEL = 16,000 ppm; UEL: unknown.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid chlorides; acid anhydrides; chloroformates.

Permissible Exposure Limits in Air

ACGIH TLV[1]: 1 milligram per cubic meter inhalable fraction TWA; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 3 milligram per cubic meter

PAC-2: 19 milligram per cubic meter

PAC-3: 110 milligram per cubic meter

DFG MAK: Carcinogen Category 2

Determination in Air: Use NIOSH Analytical Method (IV) #2005, Nitrobenzenes.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may irritate the skin and eyes. High levels of exposure may interfere with the blood's ability to carry oxygen (methemoglobinemia) causing headache, fatigue, dizziness, and cyanosis (a Blue color to the skin and lips). Higher levels can cause trouble breathing; collapse, and death.

Long-Term Exposure: There is limited evidence that this chemical causes liver cancer in animals.

Points of Attack: Liver, blood.

Medical Surveillance: Blood methemoglobin levels, CBC. Liver function disease. Based on animal studies, this chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full

facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids; acid chlorides; acid anhydrides; chloroformates.

Shipping: UN2660 Nitrotoluidines (mono), Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* 5-Nitro-*o*-toluidine, Trenton, NJ (August 1999).

Nitrous Oxide N:0680

Formula: N_2O

Synonyms: Dinitrogen monoxide; Factitious air; Hyponitrous acid anhydride; Laughing gas; Nitrogen Oxide

CAS Registry Number: 10024-97-2

HSDB Number: 504

RTECS Number: QX1350000

UN/NA & ERG Number: UN1070 (compressed)/122; UN2201 (refrigerated liquid)/122

EC Number: 233-032-0

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence, Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987. United States Environmental Protection Agency Gene-Tox Program, Positive: V79 cell culture-gene mutation; Negative: Sperm morphology-mouse; Inconclusive: Carcinogenicity-mouse/rat.

California Proposition 65 Developmental/Reproductive toxin 8/1/2008.

Hazard Alert: Poison, Oxidizing gas, Asphyxiation hazard, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertilty; Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, O, Xn; risk phrases: R8, R62; R63; safety phrases: S17; S38 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Nitrous oxide is a colorless gas. Slightly sweet odor. Shipped as a liquefied compressed gas. Molecular weight = 44.01; specific gravity (H_2O:1) = 1.8 @ 20°C; boiling point = −89°C; freezing/melting point = −91°C; Relative density of the vapor/air-mixture (air = 1) = 1.53 @ 20°C; vapor pressure = 750 mmHg @ −89°C; Slightly soluble in water; solubility = 0.1% @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 0; reactivity 0.

Potential Exposure: Used as an anesthetic in dentistry and surgery; used as a gas in food aerosols, such as whipped cream; used in manufacture of nitrites; used in rocket fuels; in firefighting; diesel emissions. Large amounts of nitrous oxide will decrease the amount of available oxygen.

Oxygen should be routinely tested to ensure that it is at least 19% by volume.

Incompatibilities: Nitrous oxide is a weak oxidizer. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Violent reactions with organic peroxides, hydrazine, hydrogen, hydrogen sulfide; lithium, boron, lithium hydride, sodium, aluminum, phosphine. This chemical is a strong oxidizer @ >300°C and self-explodes at high temperature. May form explosive mixtures with ammonia, carbon monoxide; hydrogen sulfide; oil, grease and fuels.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.80 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: none

NIOSH REL: 25 ppm/46 milligram per cubic meter TWA over the time exposed; [*Note:* REL for exposure to waste anesthetic gas]

ACGIH TLV[1]: 50 ppm TWA; not classifiable as a human carcinogen

PAC Ver. 29[138]

10024-97-2, nitrous oxide

PAC-1: 910 ppm

PAC-2: 10,000 ppm

PAC-3: 20,000 ppm

DFG MAK: 100 ppm/180 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C

Denmark: TWA 50 ppm (90 milligram per cubic meter), 1999; Finland: TWA 100 ppm, 1999; Norway: TWA 100 ppm (180 milligram per cubic meter), 1999; Sweden: NGV 100 ppm (180 milligram per cubic meter), KTV 500 ppm (900 milligram per cubic meter), 1999; Switzerland: MAK-W 100 ppm (200 milligram per cubic meter), KZG-W 200 ppm (400 milligram per cubic meter), 1999; United Kingdom: TWA 100 ppm (183 milligram per cubic meter), 2000; the Netherlands: MAC-TGG 152 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. The recommended ACGIH TLV is 50 ppm. Connecticut[60] has set a guideline for nitrous oxide in ambient air of 1.34 milligram per cubic meter.

Determination in Air: Use NIOSH Analytical Method (IV) #6600, Nitrous oxide; OSHA Analytical Methods ID-166

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause dizziness and difficult breathing. Excessive exposure may cause headaches, nausea, fatigue and irritability. Loss of consciousness may result from exposure to concentrations of 400,000−800,000 ppm. Anesthetic grades are composed of 80% nitrous oxide with 20% oxygen. High concentrations may cause a deficiency of oxygen in the air. *Skin:* Liquid may cause frostbite and freezing burns. *Eyes:* Liquid may cause frostbite and freezing burns. Vapors are nonirritating. *Ingestion:* Liquid may cause frostbite and freezing burns of the mouth and throat.

Long-Term Exposure: Increased incidence of liver and kidney disease; neurological disease; and spontaneous abortion have been reported. Nitrous oxide has been shown to cause birth defects in rats. Repeated exposure can damage the nervous system, causing numbness and weakness in the arms and legs. May damage the bone marrow and affect blood cell production. May be a teratogen in humans.

Points of Attack: Respiratory system; central nervous system; blood, reproductive system.

Medical Surveillance: Before beginning employment and a regular times after that, for those with frequent or potentially high exposures, the following is recommended: exam of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: consider nerve conduction studies; CBC; examination of the nervous system. Check the work-place air to make certain the oxygen level is at least 19%.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to nitrous oxide is dangerous because it can replace oxygen and lead to suffocation. Where there is potential exists for exposure *over 25 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Check oxygen level before entering area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Nitrous oxide must be stored to avoid contact with organic peroxides, ammonia, carbon monoxide; hydrogen, hydrogen sulfide and phosphine, since violent reactions occur. Cylinders of nitrous oxide should be stored in a cool, preferably fire resistant area, away from heat sources.

Shipping: UN1070 Nitrous oxide, compressed, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas; 5.1-Oxidizer; UN2201 Nitrous oxide, refrigerated liquid, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas; 5.1-Oxidizer. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. If flow cannot be stopped, allow it to flow into a mixture of caustic soda and slaked lime and dispose of the resulting material in a hood. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nitrous oxide is an oxidizer and will increase the intensity of any fire. Nitrous oxide self-explodes at high temperature. Extinguish fire using an agent suitable for type of surrounding fire. Nitrous oxide itself does not burn. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disperse in atmosphere or spray on dry soda ash/lime with great care; then flush to sewer.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Aspiration hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R11; R20; R22; R36/37/38; R65; R67; safety phrases: S16; S21; S23/24/25; S26; S36/37; S45; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)]

Description: Nonane is a colorless liquid. Molecular weight = 128.26; specific gravity (H_2O:1) = 0.72 @ 20°C;

boiling point = 151°C; freezing/melting point = −54°C; vapor pressure = 3 mmHg @ 20°C; 7.5 mmHg @ 34°C; Flash point = 31°C; Autoignition temperature = 205°C. Explosive limits: LEL = 0.8%; 21,000 ppm; UEL: 2.9%. Hazard identification (based on NFPA-704 M Rating System): Health 0; flammability 3; reactivity 0. Insoluble in water.

Potential Exposure: Nonane is used in the synthesis of biodegradable detergents as a distillation chaser; an ingredient in Stoddard solvent and gasoline.

Incompatibilities: Nonane forms explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.25 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 47 ppm.

OSHA PEL: None

NIOSH REL: 200 ppm/1050 milligram per cubic meter TWA

ACGIH TLV[1]: 200 ppm TWA

PAC Ver. 29[138]

PAC-1: 600 ppm

PAC-2: 830 ppm

PAC-3: 5000 ppm

Denmark: TWA 200 ppm (1050 milligram per cubic meter), 1999; Finland: TWA 200 ppm (1050 milligram per cubic meter); STEL 250 ppm (1315 milligram per cubic meter), 1999; France: VME 200 ppm (1050 milligram per cubic meter), 1999; Japan: 200 ppm (1050 milligram per cubic meter), 1999; Norway: TWA 100 ppm (525 milligram per cubic meter), 1999; Sweden: NGV 150 ppm (800 milligram per cubic meter), KTV 200 ppm (1100 milligram per cubic meter), 1999; Switzerland: MAK-W 200 ppm (1050 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1050 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 200 ppm. Several states have set guidelines or standards for nonane in ambient air[60] ranging from 10.5−13.0 milligram per cubic meter (North Dakota) to 17.5 milligram per cubic meter (Virginia) to 21.0 milligram per cubic meter (Connecticut) to 25.0 milligram per cubic meter (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nonane can affect you when breathed in. Aspiration hazard, Inhalaing or swallowing the liquid may cause chemical pneumonitis. Narcotic at high concentrations; may affect the central nervous system. Exposure to high levels can cause headache, drowsiness, dizziness, confusion, nausea, tremor, lack of coordination; and unconsciousness. Irritates the eyes, skin, respiratory tract. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long-Term Exposure: Prolonged contact can cause drying and cracking of the skin. Repeated exposure can affect the liver.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Inhalation: bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear solvent-resistant gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Respirator Selection: Where there is potential exists for exposures *over 200 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with an organic vapor cartridge/canister. Greater protection is provided by a powered-air purifying respirator. Where there is potential for high exposure exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where nonane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of nonane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Wherever nonane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Use only nonsparking tools and equipment, especially when opening and closing containers of nonane.

Shipping: UN1920 Nonanes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Carcinogenicity: IARC: Animal Inadequate Evidence, Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3 (see Appendix 4)

Hazard Alert: Combustible, Corrosive, Violently reactive with water.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C, Xi, Xn; risk phrases: R14/15; R29; R34; R36/37/38; R34; R40; R45; R51; safety phrases: S1; S22; S26; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Nonyl trichlorosilane is a clear fuming liquid. Irritating odor. Molecular weight = 261.72; specific gravity (H_2O:1) = 1.07 @ 20°C. Explosive limits: LEL = 8000 ppm, UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 2₩. Reacts violently with water, rapidly releasing heat and corrosive hydrogen chloride gas.

Potential Exposure: Used in silicone (polysiloxane) manufacture.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.60_A}$ ppm

PAC-2: $\mathbf{7.3_A}$ ppm

PAC-3: $\mathbf{33_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Nonyl trichlorosilane can affect you when breathed in. Nonyl trichlorosilane is a corrosive chemical, and can cause severe eye burns leading to permanent damage. Contact can cause severe skin burns. Exposure can irritate the eyes, nose and throat. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung irritation; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to nonyl trichlorosilane, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustible materials, such as wood, paper or oil.

Shipping: UN1799 Nonyltrichlorosilane, Hazard Class: 8; Labels: 8-Corrosive material.

Spill Handling:

Nonyltrichlorosilane when spilled in water.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft./m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft./m) 200/60

Then: Protect persons downwind (mi/km)

Day 0.3/0.5
Night 1.0/1.5
Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors-contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonyl trichlorosilane may burn, but does not readily ignite. Thermal decomposition products may include gaseous hydrogen chloride, chlorine and phosgene and oxides of metal and carbon. *For chlorosilanes do not use water. Use afff alcohol-resistant, medium expansion foam. Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Nonyl Trichlorosilane, Trenton, NJ (February 2000).

Norbormide N:0700

Formula: $C_{33}H_{25}N_3O_3$
Synonyms: Compound S-6,999; ENT 51,762; 5(α-Hydroxy-α-2-pyridylbenzyl)-7-(α-2-pyridylbenzylidene)-5-norborene-2,3-dicarboxide; MCN 1025; Norbormida (Spanish); Raticate; Raticide; S-6,999; Shoxin
CAS Registry Number: 991-42-4
HSDB Number: 1743
RTECS Number: RB8750000
UN/NA & ERG Number: UN2588 (Pesticides, solid, toxic, n.o.s.)/151
EC Number: 213-589-6 [*Annex I Index No.:* 650-004-00-7]
Regulatory Authority and Advisory Information
SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg).
Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; safety phrases: S2; S41 (see Appendix 4).

Description: Norbormide is a white crystalline powder. Molecular weight = 511.61; freezing/melting point = 190−198°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Insoluble in water.

Potential Exposure: This material is used as a selective, fast acting rat poison.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 0.35 milligram per cubic meter
PAC-2: 3.8 milligram per cubic meter
PAC-3: 190 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Harmful if inhaled or swallowed. Moderately to highly toxic to humans. Probable human lethal dose is 50–500 mg/kg, or 1 teaspoon to 1 pint for a 150 lb person. Exposure may cause a transient decrease in temperature and blood pressure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Small wet spills:* Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be treated with alkali, then landfilled. Large amounts should be incinerated[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 248-397-1

Regulatory Authority and Advisory Information

Hazard Alert: Environmental hazard, Agricultural chemical.

Potential Ground water Pollutant (California FAC Section 13149)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long lasting effects[291].

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R50; safety phrases: S29/35; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: White to gray-brown crystalline solid or powder. Odorless. Molecular weight = 303.67; specific gravity (H_2O:1) = 1.45; freezing/melting point = 184°C; vapor pressure = 2.3×10^{-8} mm @ 20°C. Slightly soluble in water; solubility = 30 mg/L.

Potential Exposure: Norflurazon is a pyridazinone selective pre-emergent herbicide used to control germinating annual grasses, sedges, rushes and broadleaf weeds in fruits (cranberries, citrus, cherries, nectarines, apricots), grape vines, vegetables, nuts, cotton, peanuts, soybeans, and various nonagricultural and industrial areas. Forbidden for use in the EU after 7/25/2003. Manufactured in the United States by Clariant Corporation, North Carolina.

Incompatibilities: rapidly degraded by strong light; UV. Incompatible with oxidizers, chlorates nitrates, peroxides.

Permissible Concentration in Water: Federal Drinking Water Guidelines: 10 ppb[14]. State Drinking Water Guidelines: Florida 280 μg/L; Maine 10.5 μg/L. *Fluoride ion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol-water coefficient: Log K_{ow} = <2.5. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may irritate skin and cause eye irritation and possible severe injury. Inhalation should be avoided; use NIOSH-or CEN (UK)-approved air purifying respirators for pesticides. Poisonous if swallowed. LD_{50} (oral, rat) = >5 g/kg; (dermal, rat) = >7.5 g/kg.

Long-Term Exposure: May cause liver cancer. Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children.

Points of Attack: Liver, ovary, uterus, thyroid; central nervous system, bones.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Liver function tests. See medical help if poisoning is suspected or if redness, itching, burning of skin or eyes develop.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with an N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Possible Human Carcinogen: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard Class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Careful, a possible carcinogen. For solids, *small spill*, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. For a *large spill* evacuate downwind at least 100 m/330 ft. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Do not allow water to get inside containers. *Small dry spill*: With clean shovel place material into clean, dry container and cover loosely; move containers from spill area. *Large spill*: Dike far ahead of liquid spill for later disposal. Following product recovery, flush area with water. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers.

Fire Extinguishing: Thermal decomposition products may include toxic gases, including oxides of nitrogen, carbon, hydrogen fluoride and hydrogen chloride gases. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft. for liquids and at least 25 m/75 ft. for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods. Follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

O

Ochratoxin A O:0050

Formula: $C_{20}H_{18}ClNO_6$
Synonyms: Alanine,*N*-[(5-chloro-8-hydroxy-3-methyl-1-*oxo*-7-isochromanyl)carbonyl]-3-; Alanine,*N*-[(5-chloro-8-hydroxy-3-methyl-1-*oxo*-7-isochromanyl)carbonyl]-3-phenyl-,(-)-; *N*-[((3R)-5-Chloro-8-hydroxy-3-methyl-1-*oxo*-7-isochromanyl)carbonyl]-3-phenyl-L-alanine; (-)-*N*-[(5-Chloro-8-hydroxy-3-methyl-1-*oxo*-7-isochromanyl)carbonyl]-3-phenylalanine; NCI-C56586; OTA; Phenyl-l-alanine; Phenylalanine-ochratoxin A; PHE-OTA
CAS Registry Number: 303-47-9
HSDB Number: 4305
RTECS Number: AY4375000
UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3462/153
EC Number: 206-143-7
Regulatory Authority and Advisory Information
Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen
California Proposition 65 Chemical[102]: cancer, 7/1/1990
Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.
Hazardous to aquatic life or environment, with possible long-lasting effects[194]. May cause long-lasting harmful effects to aquatic life
Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xn; risk phrases: R45; R20/21/22; R26/27/28; R36/38; R46; R48/23/24/25; R61; R62; R63; R65; safety phrases: S16; S22; S26; S28; S39/35; S36; S36/37/39; S45; S53; S62 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: White crystalline solid or powder. Molecular weight = 403.81; Boiling point = ~632.42°C at 760 mmHg (est.)[Santa Cruz, Biotechnology]; freezing/melting point = 169°C. Practically insoluble in water; solubility = $<$1 mg/mL @ 19°C; 0.4246 mg/L @ 25°C (est)[72].
Potential Exposure: Ochratoxin A, a carboxylic acid derivative and a naturally occurring toxic mold (strain of *Aspergillus ochraceus*), occasionally in storage grains such as wheat and on field crops such as corn and oilseed (i.e., cottonseed), in ancient tombs, and decayed vegetation. Used as a laboratory chemical for research. Not currently produced in the United States.
Incompatibilities: Ochratoxin A is Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fire. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Compounds of the carboxyl group R·COOH Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water, and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).
Permissible Exposure Limits in Air: No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.
Determination in Water: Octanol–water coefficient: Log $K_{ow} = <5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.
Routes of Entry: Ingestion
Harmful Effects and Symptoms
Short-Term Exposure: Strain of *Aspergillus ochraceus*. Fatal if ingested. LD_{50} = (oral-rat) $<$20 mg/kg
Long-Term Exposure: May cause cancer and tumors. A possible mutagen and reproductive effector.
Points of Attack: Kidneys, liver.
Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth methods if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device?* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00014-4

apparatus (SCBA) that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health hazard/toxics/poisons: Store in a secure poison location.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3462 Toxins, extracted from living sources, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft. (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep ethylene glycol diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May burn but does not easily ignite. Thermal decomposition products may include hydrogen chloride and oxides of carbon and nitrogen. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. Extinguishers. *Large fires:* water spray, fog, or foam. Move container from fire area, if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Contact with easily oxidized organic materials may cause fires and explosions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Octafluorocyclobutane O:0100

Formula: C_4F_8

Synonyms: Cyclobutane, cyclooctafluorobutane; Freon C-318; Octafluoro-; Perfluorocyclobutane; PFC-318

CAS Registry Number: 115-25-3

HSDB Number: 147

RTECS Number: GU1779500

UN/NA & ERG Number: UN1976/126

EC Number:204-075-2

Regulatory Authority and Advisory Information

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated. Suspected of causing genetic defects.

Global Warming potential (100 years time horizon): 10,300 (40 CFR 98, Subpart A)

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R36/37/38; R62; safety phrases: S16; S26; S36/37; S41; S45 (see Appendix 4)

Description: Octafluorocyclobutane is a colorless gas. Molecular weight = 200.03; boiling point = −6°C; freezing/melting point = −4.140E + 01°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Slightly soluble (slight hydrolysis).

Potential Exposure: This material is used as a refrigerant.

Incompatibilities: Octafluorocyclobutane is chemically inert in many situations, but can react violently with strong reducing agents such as hydrides and the active metals and especially the very active metals. They suffer oxidation with strong oxidizing agents and under extremes of temperature[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 400 ppm

PAC-2: 4400 ppm

PAC-3: 27,000 ppm

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Octafluorocyclobutane can affect you when inhaled. Inhalation can irritate the lungs, causing coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High levels can cause you to feel dizzy, lightheaded and to pass out. Very high levels could cause death.

Long-Term Exposure: Similar chemicals can cause irregular heartbeat, which could lead to death. Very irritating chemicals may affect the lungs; may cause bronchitis and lung damage.

Points of Attack: Lungs, heart.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: special 24 hours EKG (Holter Monitor) to look for irregular heart beat. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask), if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24—48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where, there is potential for exposures to octafluorocyclobutane exists, use NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with the full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potential high heat sources. Protect cylinders from physical damage. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1976 octafluorocyclobutane, or refrigerant gas RC-318, Hazard class: 2.2; Labels: 2.2-Nonflammable compressed gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Octafluorocyclobutane itself does not burn. Thermal decomposition products may include carbonyl fluorine, hydrogen fluoride, and oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters water ways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Octamethyl Diphosphoramide O:0110

Formula: $C_8H_{24}N_4O_3P2$; $C_8H_{24}N_4P_2O_3$

Synonyms: Bis (bisdimethylamino) phosphonousanhydride; Bis (bisdimethylaminophosphonous) anhydride; Bis-bisdimethylaminophosphonous anhydride; Bis (bisdimethylamino) phosphoric anhydride; Bis-*N*,*N*,*N*′,*N*′-tetramethylphosphorodiamidic anhydride; Diphosphoramide, octamethyl-; ENT 17,291; Letha laire G-59; Octamethyldiphosphorsaeure-tetramid (German); Octamethylpyrophosphoramide; Octamethyl pyrophosphortetramide; Octamethyl tetramido pyrophosphate; Octametilpirofosforamida (Spanish); OMPA; Ompacide; Ompatox; Ompax; Pestox; Pestox 3; Pestox III; Pyrophosphoric acid octamethylteraamide; Pyrophosphorytetrakisdimethylamide; Schradan; Schradane (French); Systam; Systophos; Sytam; Tetrakisdimethylaminophosphonous anhydride; Tetrakisdimethylaminophosphoric anhydride

CAS Registry Number: 152-16-9

HSDB Number: 1744 as Schradan

RTECS Number: UX5950000

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 205-801-0 [*Annex I Index No.:* 015-026-00-8]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Neurotoxin (cumulative), Combustible, Agricultural chemical.

Banned or Severely Restricted (in agriculture) (Russia, USA) (UN)[13]

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P085

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R27/28; R33; R50; safety phrases: S1/2; S36/37; S38; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: OMPA is a colorless liquid in crude form; otherwise, it is a dark brown viscous liquid. Molecular weight = 286.29; boiling point = 120−125°C @ 0.5 mmHg; freezing/melting point = 14−19°C; vapor pressure = 1.3×10^{-3} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 1; reactivity 0. Soluble in water.

Potential Exposure: Material is used as a systemic insecticide for plants and as an acaricide. Not registered as a pesticide in the United States.

Incompatibilities: Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrides and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101]. Acids.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.073 milligram per cubic meter

PAC-2: 0.8 milligram per cubic meter

PAC-3: 4.9 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Acute exposure to OMPA may produce the following signs and symptoms: Pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) and chest pain may be noted. Hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea, respiratory depression, and respiratory paralysis. Psychosis may occur. This material is extremely toxic; probable oral lethal dose in humans is 5−50 mg/kg, between seven drops and one teaspoonful for a 150 lb person. It is highly toxic when inhaled. Material is a cholinesterase inhibitor. It is similar in action to other organophosphorus pesticides in its toxicity. It is slightly less toxic than parathion. Gastrointestinal, neurologic, and respiratory symptoms may accompany poisoning with this material. High doses may cause a toxic psychosis similar to acute alcoholism. *Note:* Persons taking the following drugs may be at greater risk: Phenobarbital and phenaglycodol together; glutethimide, chlorpromazine hydrochloride; or mepromabate. These drugs appear to enhance the toxicity of the material markedly.

Long-Term Exposure: A cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, and central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Note to Physician: 1,1′-trimethylenebis (4-formylpyridinium bromide) dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash; pressure, pressure-demand, full-face-piece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids. Where possible, automatically transfer from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Thermal decomposition products may include phosphineand oxides of phosphorus, nitrogen and carbon. Do not extinguish fire unless flow can be stopped. Use water in flooding quantities as fog. Solid streams of water may be ineffective. Cool all affected containers with flooding quantities of water. Apply water from as far a distance as possible. Use alcohol foam, carbon dioxide; or dry chemical. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity: EPA (*isooctane; oral*): Inadequate information to assess carcinogenic potential.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Alert: Highly flammable, Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*n*- and *iso*-): Hazard symbol: F, Xn, N; risk phrases: R11; R38; R65; R67; R50/53; safety phrases: S2; S9; S16; S21; S29; S33; S60; S61; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*octane and isomers*)

Description: Octane is a colorless liquid with a gasoline-like odor. The odor threshold is 4 ppm[41] and 48 ppm (New Jersey Fact Sheet). Molecular weight = 114.26 (*both isomers*); specific gravity (H2O:1) = 0.70 @ 20°C (*both isomers*); boiling point = 126°C (*n*-); 99 C (*iso*-); freezing/melting point = −56.7 (*n*-); −108°C (*iso*-); vapor pressure = 10 mmHg @ 19°C (*n*-); 41 mmHg @ 21°C (*iso*-); flash point = 13°C (cc); autoignition temperature = 206°C. Explosive limits: LEL = 1.0%; UEL: 6.5%. Hazard identification (based on NFPA-704 M Rating System): Health 0; flammability 3; reactivity 0. Practically insoluble in water; solubility = 7×10^{-5}.

Potential Exposure: Octane is used as a solvent; as a fuel; as an intermediate in organic synthesis; and in azeotropicdistillations.

Incompatibilities: Reacts with strong oxidizers, causing fire and explosion hazard. Attacks some forms of plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm [LEL]

Conversion factor: 1 ppm = 4.67 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 4 ppm[41]; 48 ppm[70]

OSHA PEL (*n-octane only*): 500 ppm/2350 milligram per cubic meter TWA; *Construction Industry*: 400 ppm/1900 milligram per cubic meter TWA

NIOSH REL (*n-octane only*): 75 ppm/350 milligram per cubic meter TWA; 385 ppm/1800 milligram per cubic meter [15-minute] Ceiling Concentration

ACGIHTLV[1] (*all isomers*): 300 ppm/1401 milligram per cubic meter TWA

PAC Ver. 29[138]

m- & *iso*-isomers

PAC-1: 230 ppm

PAC-2: 385 ppm

PAC-3: 5000 ppm

DFGMAK (*n-isomer*): 500 ppm/2400 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D

Australia: TWA 300 ppm (1450 milligram per cubic meter); STEL 375 ppm, 1993; Austria: MAK 300 ppm (1400 milligram per cubic meter), 1999; Belgium: TWA 300 ppm (1400 milligram per cubic meter); STEL 375 ppm

(1750 milligram per cubic meter), 1993; Denmark: TWA 200 ppm (935 milligram per cubic meter), 1999; Finland: TWA 300 ppm (1400 milligram per cubic meter); STEL 375 ppm (1750 milligram per cubic meter), 1999; France: VME 300 ppm (1450 milligram per cubic meter), 1999; Japan: 300 ppm (1400 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1450 milligram per cubic meter, 2003; Norway: TWA 150 ppm (725 milligram per cubic meter), 1999; the Phillipines: TWA 500 ppm (2350 milligram per cubic meter), 1993; Poland: MAC (TWA) 1000 milligram per cubic meter; MAC (STEL) 1800 milligram per cubic meter, 1999; Russia: TWA 300 ppm, 1993; Sweden: NGV 200 ppm (900 milligram per cubic meter), KTV 300 ppm (1400 milligram per cubic meter), 1999; Switzerland: MAK-W 300 ppm (1400 milligram per cubic meter), KZG-W 600 ppm (2800 milligram per cubic meter), 1999; Turkey: TWA 400 ppm (1900 milligram per cubic meter), 1993; United Kingdom: LTEL 300 ppm (1450 milligram per cubic meter); STEL 375 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 300 ppm. Several states have set guidelines or standards for octane in ambient air [60] ranging from 7.0 milligram per cubic meter (Connecticut) to 14.5−18.0 milligram per cubic meter (North Dakota) to 24.0 milligram per cubic meter (Virginia) to 34.524 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1500, for hydrocarbons, BP 36−126°C; #2549, volatileorganic compounds; OSHA Analytical Method 7.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Octane can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Skin contact can cause rash and a burning sensation. Swallowing the liquid may cause aspiration into the lungs and chemical pneumonitis. Exposure to high concentrations of vapor can cause lightheadedness, dizziness, confusion, and may cause you to pass out.

Long-Term Exposure: Repeated or prolonged contact can result in dry, cracked skin.

Points of Attack: Eyes, skin, and respiratory system; central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Give victim nothing to drink.

Note to Physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation Neoprene, Nitrile/PVC, and Nitrile are recommended. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 750 ppm*: Sa (APF = 10) (any supplied-air respirator).* *Up to 1000 ppm*: Sa: Cf (APF = 25) (any supplied -air respirator operated in a continuous-flow mode);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Octane must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where octane is used, handled, or stored. Metal containers used in the transfer of 5 gallons or more of octane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of octane.

Shipping: UN1262 Octanes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an after burner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 247-761-7 [*Annex I Index No.:* 613-112-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison (EPA Toxicity Class I, Danger, Highly toxic), Combustible, Corrosive, Sensitization hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn, Xi, N; risk phrases: R22; R23/24/25; R34; R36/37/38; R43; R50/53; safety phrases: S1/2; S26; S29/35; S36/37/38; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: Yellow solid or clear dark amber liquid. Molecular weight = 213.35; Specific gravity (H_2O:1) = 1.04 @ 20°C; boiling point = 119.5°C; vapor pressure = 3 mmHg @ 25°C; flash point = > 100°C. Low solubility in water; solubility = < 1 mg/mL @ 25°C.

Potential Exposure: Isothiazolone/isothiocyanate/heteroaramatic fungicide and microbiocide used on textiles, in metalworking fluids, and some water thinned paints. Its use as a fungicide on cotton was canceled in the United States and the tolerances were revoked in 1998.

Incompatibilities: Oxidizers. Contact with hydrogen peroxide may form explosive material. Isothiocyanates are incompatible with many classes of compounds, reacting exothermically to release toxic gases. Reactions with amines, aldehydes, alcohols, alkali metals, ketones, mercaptans, strong oxidizers, hydrides, phenols, and peroxides can cause vigorous releases of heat. Ketones behave a weak acid. Forms water soluble alkali metal salts. Ketones are reactive with many acids and bases liberating heat and flammable gases. The amount of heat may be sufficient to start a fire in the unreacted portion of the ketone. Ketones react with reducing agents such as hydrides, alkali metals, and nitrides to produce flammable hydrogen gas and heat. Ketones are incompatible with isocyanates, aldehydes, cyanides, peroxides, and anhydrides. They react violently with aldehydes, nitric acid, and perchloric acid[101].

Permissible Exposure Limits in Air:

Determination in Air: Charcoal adsorption followed by CS_2 treatment and gas chromatographic analysis. See NIOSH Method 1300 [Ketones] [18]

Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.5. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, inhalation, dermal, and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic by all routes. Contact can irritate the skin. Exposure can irritate the eyes and respiratory tract. Exposure to high concentrations may cause dizziness, lightheadedness, and unconsciousness. LD_{50} (oral, rat) = 550 mg/kg; (dermal, rat) = 4 mg/kg; (inhalation, rat) = < 1 mg/kg.

Long-Term Exposure: Repeated skin exposure can cause dryness and skin cracking. This chemical has not been adequately evaluated to determine whether brain or nerve damage could occur with repeated exposure. However, many solvents and other petroleum-based chemicals have been shown to cause such damage. Effects may include reduced memory and concentration, personality changes (withdrawal, irritability), and fatigue, sleep disturbances, reduced coordination, and/or effects on the nerves to the arms and legs causing weakness and "pins and needles."

Points of Attack: Respiratory system, skin.

Medical Surveillance: Preplacement examinations should evaluate skin and respiratory conditions. Acetone can be detected in the blood, urine, and expired air, and can be used as an index of exposure. Evaluation for brain effects such as changes in memory, concentration, sleeping patterns, and mood, as well as headaches and fatigue. Consider evaluations of the cerebellar, autonomic, and peripheral nervous systems. Positive and borderline individuals should be referred for neuropsychological testing

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth methods if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device?* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and longpants; chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; chemical-resistant foot wear plus socks; Protective eye wear; chemical-resistant headgear for overhead exposure; chemical-resistant apron when cleaning equipment, mixing, or loading[72]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSIZ88.2, or European Standard EN 149.

Storage: (**1**) Color code—White: Corrosive or contact hazard; store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids. Where possible, automatically transfer from drums or other storage containers to process containers.

Shipping: UN2922 Corrosive liquids, toxic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May burn but does not easily ignite. Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. *Small fires:* Dry chemical, carbon dioxide; water spray; or foam. extinguishers. *Large fires:* Water spray, fog, or foam. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Contact with easily oxidized organic materials may cause fires and explosions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

tert-Octyl Mercaptan O:0128

Formula: $C_8H_{18}S$

Synonyms: 2-Methyl-2-heptanethiol; *tert*-Octanethiol; Octyl mercaptan-t; *t*-Octyl mercaptan; 1,1,3,3-Tetramethyl-1-butylsulfhydrate; 2,4,4-Trimethyl-2-pentanethiol

CAS Registry Number: 141-59-3

HSDB Number: 6319

RTECS Number: SA3260000

UN/NA & ERG Number: (PIH) UN3023/131

EC Number: 205-490-1

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin, Flammable liquid.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, Xn; risk phrases: R11; R20/22; R23/24/25; R36/37/38; R39; R41; R50/53; safety phrases: S7; S16; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: 2,4,4-Trimethyl-2-pentanethiol is a clear, colorless liquid. Molecular weight = 146.29; specific gravity (H_2O:1) = 0.85 @ 16°C; boiling point = 155.48°C; freezing/melting point = 45.8°C; vapor pressure = 5.198 mmHg @ 25°C; flash point = 41°C. Henry's Law constant = 1.9×10^{-2} atm-m^3/mol @ 25°C (est)[72]. Hazard identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0[88], HSDB. Soluble in water; solubility = 31 mg/L @ 25°C.

Potential Exposure: A mercaptan, sulfhydral, thioalcohol, and organic sulfide. Used as a lubricant additive and in polymer modification[193].

Incompatibilities: Highly flammable; easily ignited by heat, sparks, or flames. Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Attacks many metals and rubber.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]

PAC-1: 0.055 ppm

PAC-2: $\mathbf{0.60_A}$ ppm

PAC-3: $\mathbf{1.8_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Water: Octanol−water coefficient: Log K_{ow} = ~4.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms. Runoff from fire control or dilution water may cause pollution.

Routes of Entry: Inhalation, ingestion, and dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: 2,4,4-Trimethyl-2-pentanethiol is highly toxic. It may be fatal if inhaled, ingested or absorbed through skin. Inhalation or contact will irritate or burn skin and eyes and cause dizziness, headache, nausea, vomiting, and unconsciousness. May attack the central nervous system, causing convulsions, lowering of consciousness, and respiratory depression. Exposure may result in death.

Long-Term Exposure: May be neurotoxic with cumulative effects.

Points of Attack: Brain. Central nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth methods if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device?* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. Wash skin with soap and water. In the case of burns, immediately cool affected skin for as long as possible with cold water. Do not remove clothing if adhering to skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code—Blue: Health hazard/poison: Store in a secure poison location. Color code—Red: Flammability hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. This chemical must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where octane is used, handled, or stored. Metal containers used in the transfer of 5 gallons or more of octane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers.

Shipping: UN3023 2-Methyl-2-heptanethiol, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard; 3-Flammable liquid; Inhalation Hazard Zone B

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/03

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire. *Eliminate* all ignition sources (no smoking, flares, sparks, or flames in immediate area). All equipment used when handling the product must be grounded. Do not touch or walk through spilled material. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. A vapor suppressing foam may be used to reduce vapors. *Small spill*: Absorb with earth, sand, or other noncombustible material and transfer to containers for later disposal. Use clean nonsparking tools to collect absorbed material. *Large spill:* Dike far ahead of liquid spill for later disposal. Water spray may reduce vapor; but may not prevent ignition in closed spaces. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen sulfide and and oxides of sulfur and carbon. Vapors may cause dizziness or suffocation. Vapors may travel to source of ignition and flash back. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, and tanks). Vapor explosion and poison hazard indoors, outdoors, or in sewers. Runoff from fire control or dilution water may cause pollution. Runoff to sewer may create fire or explosion hazard. Containers may explode when heated.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 248-310-7

Regulatory Authority and Advisory Information

FDA: 21CFR§175.105

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R21; R22; R38; R41; R51; safety phrases: S16; S26; S36; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Octyl phenol is a white to pink crystalline solid. Molecular weight = 206.36; boiling point = 280−302°C; freezing/melting point = 72−74°C; flash point = ~149°C. Insoluble in water.

Potential Exposure: As a fuel oil stabilizer; as an intermediate for resins; in fungicides, bactericides, dyestuffs, adhesives, antioxidants, nonionic surfactants; plasticizers and rubber; in adhesives; and food packaging.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: May cause irritation to lungs and throat. *Skin*: May cause irritation. *Eyes*: May cause severe irritation. *Ingestion*: Moderately toxic; may cause digestive upset. LD_{50} = (ip-mouse) 25 mg/kg.

Long-Term Exposure: May cause liver and/or kidney damage. May be a mutagenic.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)- approved respirator such as a supplied-air respirator with a full-face-piece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Will ignite at about 149°C. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an after burner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 242-777-0

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Carcinogens: Likely a human carcinogen

California Proposition 65 Chemical[102]: Cancer, 9/12/2008

Hazard Alert: Poison, Sensitization hazard, Suspected reprotoxic hazard, Agricultural chemical.

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Regulations: Hazard symbol: Xn, N; risk phrases: R45; R40; R43; R50/53, Xi; safety phrases: S2; S50/53; R60 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Yellow−orange crystalline solid or powder. Odorless. Molecular weight = 346.36; specific gravity (H_2O:1) = 1.2; boiling point = (decomposes); freezing/melting point = 138°C; vapor pressure = 1.2×10^{-8} mm @ 20°C. Low solubility in water; solubility = 2.49 mg/L.

Potential Exposure: Oryzalin is a 2,6-dinitroaniline herbicide used to control annual grasses, herbaceous plants, woody shrubs, vines, and broad leaf weeds on fruit and nut trees, soya beans, peas, sweet potatoes, berries, vine and crops, cotton, Christmas tree plantations, commercial/industrial and recreation area lawns, golf course turf, residential lawns and turf, ornamental, and/or shade trees, nonagricultural rights-of-way, nonagricultural uncultivated and industrial areas, power stations, paths/patios, and paved areas.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Slowly hydrolyzes in water, releasing ammonia, and forming acetate salts. Decomposes at 265°C releasing toxic oxides of nitrogen, sulfur, and carbon. Decomposed by strong ultraviolet light.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution. State Drinking Water Guidelines: Florida 350 μg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = > 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Short-Term Exposure: Slight irritant to skin, eyes, and mucous membranes. Dermatitis may develop. Potential liver, kidney, and spleen toxin. LD_{50} (oral, rat) = > 7 g/kg; (dermal, rat) = >2 g/kg.

Long-Term Exposure: May cause skin sensitization. This chemical can bioaccumulate. A potential human carcinogen.

Points of Attack: Liver, kidney, spleen, and skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Kidney, spleen, and liver function tests. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Dinitroanilines react with cellulose-based and expanded polymeric absorbents[88]. Reacts with the following absorbent materials: Cellulose-based; mineral-and clay-based; expanded polymeric[88]. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA

(APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Blue: Health hazard/poison. Store in a secure poison location. (2) Color code—Yellow Stripe: Reactivity hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids; strong bases and other incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneoushazardous material, Technical Name Required. UN1596 Dinotoanilines, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Decomposes above 250°C. Thermal decomposition products may include toxic oxides of nitrogen, sulfur, and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray, or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%. as osmium tetroxide.
European/International Regulations (*tetroxide*): Hazard symbol: T+, N; Risk phrases: R26/27/28; R34; R62; R63; safety phrases: S1/2; S7/9; S26; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): Nonhazardous to water. (metal, <1 mm.)
Description: Osmium is a blue−white metal. It is found in platinum ores and in the naturally occurring alloy osmiridium. Osmium when heated in air or when the finely divided form is exposed to air at room temperature, oxidizes to form the tetroxide (OsO_4), osmic acid. Osmium tetraoxide is a colorless, crystalline solid or pale-yellow mass. Unpleasant, acrid, chlorine-like odor. A liquid above 41°C. Molecular weight = 190.2 (Os); 254.23 (OsO_4); specific gravity (H_2O:1) = 22.6 (Os); 5.1 (OsO_4); boiling point = 5012°C (Os); 131°C (sublimes well below the BP, OsO_4); freezing/melting point = 41°C (OsO_4); vapor pressure = 7 mmHg @ 20°C (OsO_4). Slightly soluble in water; solubility = 6% @ 25°C (OsO_4). Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 3 (oxidizer).
Potential Exposure: Osmium may be alloyed with platinum metals, iron, cobalt, and nickel; and it forms compounds withtin and zinc. The alloy with iridium is used in the manufacture of fountain pen points, engraving tool; record player needles; electrical contacts; compass needles; fine machine bearings; and parts for watch and lock mechanisms. The metal is a catalyst in the synthesis of ammonia; and in the dehydrogenation of organic compounds. It is also used as a stain for histological examination of tissues. Osmium tetroxide is used as an oxidizing agent, catalyst, and as a fixative for tissues in electron microscopy. Other osmium compounds find use in photography. Osmium no longer is used in incandescent lights or in fingerprinting.
Incompatibilities: Osmium tetroxide is a strong oxidizer. Reacts with combustibles and reducing materials. Reacts with hydrochloric acid to form toxic chlorine gas. Forms unstable compounds with alkalis.
Permissible Exposure Limits in Air
NIOSH IDLH = 1 mg[OsO_4]/m^3
Conversion factor: 1 ppm = 10.40 milligram per cubic meter (tetroxide) @ 25°C & 1 atm
OSHA PEL: 0.002 mg[Os]/m^3 TWA
NIOSH REL: 0.0002 ppm/0.002 mg[Os]/m^3 TWA; 0.006 mg[Os]/m^3/0.0006 ppm STEL
ACGIH TLV[1]: 0.0002 ppm/0.0016 mg[Os]/m^3 TWA; 0.0047 mg[Os]/m^3/0.0006 ppm STEL
PAC* Ver. 29[138]
7440-04-2, elemental
PAC-1: 0.28 milligram per cubic meter
PAC-2: 3.1 milligram per cubic meter
PAC-3: 19 milligram per cubic meter
20816-12-0, tetroxide
NIOSH IDLH = 1 mg[OsO_4]/m^3
Odor threshold = 0.0019 ppm
PAC-1: 0.0006 ppm (6.00E-4)
PAC-2: **0.0084**$_{\mathbf{A}}$ ppm
PAC-3: **4.0**$_{\mathbf{A}}$ ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
Arab Republic of Egypt: TWA 0.0002 ppm (0.002 mg [Os]/m^3), 1993; Australia: TWA 0.0002 ppm (0.002 mg [Os]/m^3); STEL 0.0006 ppm, 1993; Austria: MAK 0.0002 ppm (0.002 mg[Os]/m^3), 1999; Belgium: TWA 0.0002 ppm (0.0016 mg[Os]/m^3); STEL 0.0006 ppm, 1993; Denmark: TWA 0.0002 ppm (0.002 mg[Os]/m^3), 1999; Finland: TWA 0.0002 mg[Os]/m^3; STEL 0.002 mg[Os]/m^3, 1999; France: VME 0.0002 ppm (0.002 mg[Os]/m^3), 1999; the Netherlands: MAC-TGG 0.002 mg[Os]/m^3, 2003; Norway: TWA 0.0002 ppm (0.002 mg[Os]/m^3), 1999; the Philippines: TWA 0.002 mg[Os]/m^3, 1993; Switzerland: MAK-W 0.0002 ppm (0.002 mg[Os]/m^3), KZG-W 0.0004 ppm, 1999; United Kingdom: TWA 0.0002 ppm (0.002 mg [Os]/m^3); STEL 0.0006 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 0.0006 (Os)ppm. There is presently no PEL for elemental, metallic osmium. Several states have set guidelines or standards for osmium tetroxide in ambient air[60] ranging from zero in North Dakota to 0.04 μ/m^3 (Connecticut) to 1.0 μ/m^3 (Nevada) to 3000 μ/m^3 (Virginia).
Determination in Air: No NIOSH Analytical Method available.
Determination in Water: Osmium tetraoxide may be hazardous to the environment; crustacea, in particular, may be at risk.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Osmium metal is innocuous, but persons engaged in the production of the metal may be exposed to acids and chlorine vapors. By contrast, osmium tetroxide vapors are poisonous and extremely irritating to the eyes; even in low concentrations they may cause weeping and persistent conjunctivitis. Longer exposure can cause redness, swelling of the eye tissue; blurred vision; and may result in damage to the cornea and permanent loss of vision. Contact with skin may cause discoloration (green or black) dermatitis and ulceration. *Inhalation*: Fumes are extremely irritating to the respiratory system, causing tracheitis, bronchitis, bronchial spasm; and difficulty in breathing which may last several hours. Longer exposures can cause serious inflammatory lesions of the lungs (bronchopneumonia with suppuration and gangrene). Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure to high concentrations may result in death. Slight kidney damage was seen in rabbits inhaling lethal concentrations of vapor for 30 minutes. Some fatty degeneration of renal tubules was seen in one fatal human case along with bronchopneumonia following an accidental overexposure.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. The substance may cause kidney damage. Repeated exposure may cause lung irritation; bronchitis may develop. There is limited evidence that osmium tetroxide may cause mutations.

Points of Attack: Eyes, respiratory system; lungs, skin, and kidneys.

Medical Surveillance: Consider the skin, eyes, respiratory tract, and renal function in preplacement or periodic examinations. Lung function tests. Complete eye exam. Urinalysis. Chest X-ray.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth methods if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device?* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Avoid all contact. Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eye wash.

Respirator Selection: *Up to 0.1 milligram per cubic meter*: CcrFS100 (APF = 50) [Any air-purifying full-face-piece respirator equipped with cartridge(s) providing protection against the compound of concern in combination with an N100, R100, or P100 filter]; or GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back- mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Blue: Health hazard/poison (*osmium tetroxide*): Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store refrigerated in tightly closed containers away from hydrochloric acid, reducing agents and easily oxidized materials. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2471 Osmium tetroxide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Osmium tetraoxide may burn but does not easily ignite. Thermal decomposition products may include oxides of osmium. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. extinguishers. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Contact with easily oxidized organic materials may cause fires and explosions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 243-215-7 [*Annex I Index No.:* 606-045-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, Possible human carcinogen

California Proposition 65 Chemical[102]: Carcinogen (7/1/1991) and developmental toxin (5/15/1998)

Hazard Alert: Poison, Suspected reprotoxic hazard, Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R45; R50/53; R60; R61; R63; safety phrases: S2; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Colorless crystalline solid. Odorless. Molecular weight = 345.22; boiling point = 281.5°C; freezing/melting point = 89°C; vapor pressure = 1.15×10^{-7} mm @ 20°C[83,USDA]. Low solubility in water; solubility = 0.7 mg/L @ 20°C.

Potential Exposure: An oxadiazolinone/oxidiazole preemergence and early postemergence herbicide used to control annual grasses, sedges, and broadleaf weeds. Originally registered for use on turf and ornamentals; has wide use on golf courses.

Incompatibilities: Dust may form explosive mixture in air. Diazo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. This chemical is sensitive to prolonged exposure to heat. This chemical is incompatible with strong oxidizing agents[101].

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Determination in Water: Octanol−water coefficient: Log $K_{ow} = > 4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May irritate the eyes and skin. LD_{50} (oral, rat) = > 3 g/kg[83]; (dermal, rat) = > 2 g/kg.

Long-Term Exposure: Frequent or prolonged exposure may cause cancer. Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. May cause liver problems. Repeated exposure may cause weight loss and reduced red blood cell count. May be mutagenic.

Points of Attack: Liver, blood, and bones; may affect fetus.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Test for anemia, liver function tests. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPontTychem suit fabrics, barrier laminate, or Viton; Chemical-resistant foot wear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240 (d) (4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health hazard/possible human carcinogen: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Careful, a possible carcinogen. For solids, *small spill*, isolate spill or leak area in all directions for at least 25 m/75 ft. Increase, in the downwind direction, as necessary. For a *large spill* evacuate downwind at least 100 m/330 ft. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Do not allow water to get inside containers. *Small dry spill*: With clean shovel place material into clean, dry container and cover loosely; move containers from spill area. *Large spill*: Dike far ahead of liquid spill for later disposal. Following product recovery, flush area with water. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers. Prevent entry into waterways, sewers, basements, or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste, and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state, and local hazardous waste laws to ensure complete and accurate classification and disposal methods. Follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

UN/NA & ERG Number: UN1544 (Alkaloids, solid, n.o.s.)/151

EC Number: 211-139-3 [*Annex I Index No.:*614-025-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Suspected of causing genetic defects.

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

Canada: WHMIS, Class D1A; Not on DSL or NDSL lists.

European/International Regulations (630-60-4): Hazard symbol: T; risk phrases: R23/25; R33; R50; R62; safety phrases: S1/2; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Ouabain is a white crystalline solid. Molecular weight = 584.73; freezing/melting point = (decomposes) 190°C. Slightly soluble in water.

Routes of Entry: Inhalation, ingestion.

Potential Exposure: Ouabain, similar to digitoxin, is used to produce rapid digitalization in acute congestive heart failure. Also recommended in treatment of atrial or nodal paroxysmal tachycardia and atrial flutter; enzyme inhibitor.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.).

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.75 milligram per cubic meter

PAC-2: 8.3 milligram per cubic meter

PAC-3: 50 milligram per cubic meter

Determination in Water: Log $K_{ow} = < -1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Upon exposure to ouabain, symptoms of heart failure occur, with marked increase in serum potassium. Signs may include confusion, vomiting, coma, convulsions, and respiratory failure. It is classified as extremely toxic. Probable oral lethal dose in humans is less than 5 mg/kg or a taste (less than 7 drops) for 70 kg (150 lb) person. Exposure may result in respiratory and cardiac failure; and/or hyperalkemia. $LD_{50} =$ (oral-mouse) $\geq$ 500 mg/kg *Note:* Patients with frequent premature ventricular heart beat or who have received any preparation of digitalis during preceding 3 weeks are prone to toxicity.

Points of Attack: Heart, other organs.

Medical Surveillance: EKG, tests of Lungs, liver, kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: For emergency situations, wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. pressure, pressure-demand, full-face-piece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN1544 Alkaloids, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch spilled material. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move container from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. Cool containers that are exposed to flames with water from the side until well after fire is out. For massive fires use unmanned hose holder or monitor nozzles; if this is impossible, withdraw and let fire burn. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Oxalic Acid O:0160

Formula: $C_2H_2O_4$; $C_2H_6O_6$; $HOOCCOOH \cdot 2H_2O$

Synonyms: Acide oxalique (French); Aktisal; Aquisal; Ethanedioic acid; Ethanedioic acid; NCI-C55209; Oxalic aciddihydrate; Oxalsaeure (German)

CAS Registry Number: 144-62-7

HSDB Number: 1100

RTECS Number: RO2450000

UN/NA & ERG Number: UN3261/154

EC Number: 205-634-3 [*Annex I Index No.:* 607-006-00-8]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R21/22; R60; R61; R62; safety phrases: S2; S24/25 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Oxalic acid is a colorless, odorless powder, or granular solid. The anhydrous form $(COOH)_2$ is an odorless, white solid; the solution is a colorless liquid. Molecular weight = 90.04; specific gravity (H_2O:1) = 1.9 @ 17°C; sublimation point = 150−157°C; freezing/melting point (decomposes): 101.7°C; 190°C (anhydrous); vapor pressure = 0.54 mmHg @ 105°C;. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Moderately soluble in water.

Potential Exposure: Oxalic acid is used in textile finishing, paint stripping; metal and equipment cleaning; as an intermediate; as an analytic reagent and in the manufacture of dyes, inks, bleaches, and paint removers; varnishes, wood, and metal cleansers; dextrin, cream of tartar, celluloid, oxalates, tartaric acid, purified methyl alcohol, glycerol, and stable hydrogen cyanide. It is also used in the photographic, ceramic, metallurgic, rubber, leather, engraving, pharmaceutical, paper, and lithographic industries.

Incompatibilities: The aqueous solution is a medium-strong acid. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from silver compounds; strong alkalis; chlorites. Contact with some silver compounds forms explosive materials.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 milligram per cubic meter

OSHA PEL: 1 milligram per cubic meter TWA

NIOSH REL: 1 milligram per cubic meter TWA; 2 milligram per cubic meter STEL

ACGIH TLV[1]: 1 milligram per cubic meter TWA; 2 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 2 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 500 milligram per cubic meter

Arab Republic of Egypt: TWA 1 milligram per cubic meter, 1993; Australia: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter, 1993; Austria: MAK 1 milligram per cubic meter, 1999; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1999; France: VME 1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Poland: MAC (TWA) 1 milligram per cubic meter; MAC (STEL) 2 milligram per cubic meter, 1999; Sweden: NGV 1 milligram per cubic meter, KTV 2 milligram per cubic meter, 1999; Switzerland: MAK-W 1 milligram per cubic meter, 1999; United Kingdom: TWA 1 milligram per cubic meter; STEL 0.2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 2 milligram per cubic meter. Several states have set guidelines or standards for oxalic acid in ambient air[60] ranging from 3.3 μ/m^3 (New York) to 10.0 μ/m^3 (Florida and South Carolina) to 10−20 μ/m^3 (North Dakota) to 16.0 μ/m^3 (Virginia) to 20.0 μ/m^3 (Connecticut) to 24.0 μ/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < -1$ (estimated). Unlikely to bioaccumulate in marineorganisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Corrosive on ingestion. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Also, very high exposure (far above the OEL) can cause death. *Inhalation:* Contact with dust or mist can cause irritation, burns and sores of the nose and throat. *Skin:* Contact with solid or solution may cause severe burns. *Eyes:* Contact with solid or solution may cause severe burns and eye damage. *Ingestion:* Onset of symptoms is usually rapid and includes burning and erosion of mouth, throat, and stomach tissue; nausea; vomiting, including vomiting blood; abdominal pain; diarrhea and bloody stools; numbness of fingers and toes; shock; collapse and convulsions; and kidney damage. Ingestion of 5 g (1/6 ounce) can be fatal.

Long-Term Exposure: Prolonged skin contact can cause irritation and slowly healing sores, pain, and discoloration (blue color) in fingers and localized tissue damage; gangrene may develop. Contact with dust or mist may cause inflammation and irritation of the nose and throat. May affect the kidneys and urinary stone formation. Repeated exposure may cause irritability, headache, and weakness.

Points of Attack: Eyes, skin, and respiratory system; kidneys.

Medical Surveillance: NIOSH lists the following tests: Urine (chemical/metabolite). If symptoms develop or overexposure is suspected, the following may be useful: Kidney function tests. Exam of the blood vessels in exposed areas. For an acute overexposure, consider testing serum calcium level.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth methods if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device?* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene, nitrile/PVC, nitrile, and polyethylene are recommended. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: 25 *milligram per cubic meter*: Sa: Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PAPRDM* (any powered, air-purifying respirator with a dust and mist filter). *50 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *500 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—White: Corrosive or contact hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Oxalic acid must be stored to avoid contact with silver or strong oxidizers (such as chlorine and bromine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where oxalic acid is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3261 Corrosive solid, acidic, organic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Wearing proper protective clothing and equipment, cover with soda ash or sodium bicarbonate. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include formic acid and oxides of carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; or water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves chemical reaction with limestone or calcium oxide forming calcium oxalate. This may then be incinerated utilizing particulate collection equipment to collect calcium oxide for recycling.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn, N; risk phrases: R21; R26/28; R33; R50/53; R63; safety phrases: S1/2; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Oxamyl is a white crystalline solid. Sulfur or garlic-like odor. Molecular weight = 219.3. Melting/freezing point = 100°−102°C. Vapor pressure = 2.4×10^{-4} mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. Slightly soluble in water; solubility = 280 g/L @ 25°C. Carrier solvents used in commercial formulations may change physical and toxicological properties.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Potential Exposure: A carbamic acid, carbamate/organonitrogen pesticide. Used as an insecticide, nematicide, and acaricide on many field crops, vegetables, fruits, and ornamentals.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.15 milligram per cubic meter

PAC-2: 1.7 milligram per cubic meter

PAC-3: 4.7 milligram per cubic meter

Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 200 μg/L; State Drinking Water Standards: California 50 μg/L; State Drinking Water Guidelines: Arizona 180 μg/L; Maine 175 μg/L; Massachusetts 50 μg/L.

Determination in Water: Fish Tox = 707.10678000 ppb MATC (VERY LOW). Octanol−water coefficient: Log $K_{ow} = < -0.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause skin and eye irritation. Acute exposure to oxamyl usually leads to a cholinergic crisis. Signs and symptoms may include increased salivation; lacrimation (tearing), perspiration, spontaneous defecation; and spontaneous urination. Pinpoint pupils; blurred vision; tremor, muscle twitching; mental confusion; convulsions, and coma may occur. Gastrointestinal symptoms include abdominal pain; diarrhea, nausea, and vomiting. Bradycardia (slow heart rate) is common. Dyspnea (shortness of breath) and pulmonary edema may also occur. Classified by the World Health Organization as highly hazardous. Has also been rated as extremely-to super-toxic. Acute oral exposure (ingestion) to oxamyl has caused death. Oxamyl is a potent cholinesterase inhibitor. LD_{50} = 5 mg/kg[77].

Long-Term Exposure: Can cause slight nervous system effects. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system causing numbness and/or weakness in the hands and feet. Repeated exposure may cause personality changes with depression, anxiety, and irritability. May cause liver damage. Human Tox = 200.00000 ppb MCL (VERY LOW).

Points of Attack: Respiratory system, lungs, and central nervous system; cardiovascular system, skin, eyes, liver, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Consider liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to the health care facility.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)- approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and light. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2991 Carbamate pesticides, liquid, toxic, flammable, flash point <23°C, Hazard Class: 6.1; Labels: 6.1-Poisonous material, 3-Flammable liquid.

Spill Handling: UN2811: Isolation distance, spill: 25m/75 ft. (NJ). Isolation distance, Fire: 800 m/0.5mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur and carbon. Extinguish fire using agent suitable for type of surrounding fire, as the material itself does not burn or burns with difficulty. Use water in flooding quantities as a fog. Use alcohol foam, carbon dioxide or dry chemical. Move container from fire area. Fight fire from maximum distance. Dike fire control water for later disposal does not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Small quantities may be treated with alkali and buried in a landfill[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Oxycarboxin O:0175

Formula: $C_{12}H_{13}NO_4S$

Synonyms: Carboject; Carboxin sulfone; DCMOD; 2,3-Dihydro-5-carboxanilido-6-methyl-1,4-oxathiin-4,4-dioxide; 5,6-5,6-Dihydro-2-methyl-1,4-oxathiin-3-carboxanilide 4,4-dioxide; 5,6-Dihydro-2-methyl-*N*-phenyl-1,4-oxathiin-3-carboxamide-4,4-dioxide; Dynam; F461; Fungisol; 1,4-Oxathiin-3-carboxanilide, 5,6-dihydro-2-methyl-, 4,4-dioxide; 1,4-Oxathiin-3-carboxamide, 5,6-dihydro-2-methyl-*N*-phenyl-, 4, 4-dioxide; Oxycarboxine; Plantvax; Plant Wax; Vitavex

CAS Number: 5259-88-1

HSDB Number: 1747

RTECS Number: RP4900000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 226-006-2 [*Annex I Index No.:* 006-060-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Exposure can be lethal, Combustible, Suspected reprotoxic hazard[TRI], Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Harmful to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn, N; risk phrases: R22; R52/53; R63; safety phrases: S2; S61 (see Appendix 4)

Description: Oxydisulfoton is a white corrosive solid. Molecular weight = 290.42; 267.30; specific gravity (H_2O:1) = 1.40 @ 20°C; boiling point = 528°C; freezing/melting point = 121°C; vapor pressure = 3.2×10^{-11} mmHg @ 25°C; flash point = 220°C. Hazard Identification (based on NFPA-704M Rating System): Health 4, flammability 1, reactivity 0. Slightly soluble in water; solubility = 0.3 g/L @ 25°C.

Potential Exposure: A carboxamide fungicide used as a foliar systemic fungicide for use against rust on carnations and greenhouse geranium.

Incompatibilities: May react with strong oxidizers such as chlorates, peroxides, and nitrates. Can become unstable in acidic and alkaline media. Combustible; dust may form explosive mixture with air. Corrosive, may attack some metals, rubbers, and plastics.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion dermal and/or eye contact. May penetrate unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Harmful if ingested. May cause skin, eye, and respiratory tract irritation. LD_{50} (oral, rat) = > 2 g/kg; (dermal, rat) = > 5 g/kg[83].

Long-Term Exposure: May affect reproduction, DNA.

Points of Attack: Skin, eyes, reproductive system.

Medical Surveillance: Comprehensive preplacement or initial medical and work histories with emphasis on reproductive experience and menstrual history. Comprehensive physical examination with emphasis on the genito-urinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum FSH, and serum LH may be carried out if, in the opinion of the responsible physician, they are indicated. Employees shall be counseled by a health officer or physician to ensure that each employee is aware that this chemical may affect the reproductive system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Wear-protective eye protection, gloves and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure- demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—White: Corrosive or contact hazard; store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Prior to working with oxycarboxin all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneoushazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol-resistant foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using alicensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human Limited Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (feed); clear evidence: mouse, rat California Proposition 65 Chemical[102]: Cancer, 1/1/1988.

Hazard Alert: Poison, Sensitization hazard (skin), Polymerization hazard, Possible risk of forming tumors, Suspected of causing genetic defects, Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R19; R23/24/25; R43; R46; R50/53; R62; safety phrases: S29; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: 4,4′-Oxydianiline is a white crystalline solid, or a beige powder. Molecular weight = 200.26; boiling point ≥ 300°C (sublimes); freezing/melting point = 187°C; flash point = 219°C; vapor pressure = 3×10^{-7} mmHg @ 25°C. Very slightly soluble in water.

Potential Exposure: Intermediate in the manufacture of high-temperature-resistant, straight polyimide and poly (esterimide) resins capable of withstanding temperatures of Up to 480°C for short periods or 260°C for prolonged periods of time. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.2 milligram per cubic meter

PAC-2: 24 milligram per cubic meter

PAC-3: 140 milligram per cubic meter

DFG MAK: Danger os skin sensitization; Carcinogen Category 2

Russia set a MAC in work-place air of 5.0 milligram per cubic meter.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of the skin and/or eyes. Poisonous. LD_{50} = (oral-rat) 725 mg/kg.

Long-Term Exposure: It has caused liver disease and retinopathy in rats. A potential occupational carcinogen.

Points of Attack: Liver.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. If skin sensitization is suspected, consider evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Liver tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth methods if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device?* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere. Protect from exposure to light and oxidizing agents. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Thermal decomposition products may include oxides of nitrogen and carbon. UN2811: Isolation Distance, Spill: 25 m/75 ft. (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Remove all sources of ignition and dampen spilled material with 60%−70% acetone to avoid airborne dust and collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with provision for nitrogen oxides removal from flue gases.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: 10-10′-Oxidiphenoxarsine is a colorless crystalline, organometallic solid or a dense yellow liquid. Odorless. Molecular weight = 502.24; specific gravity (H_2O:1) = 1.3 @ 20°C; boiling point = 233°C; freezing/melting point = 185°C; vapor pressure = 1×10^{-5} mmHg @ 25°C. Thermal decomposition temperature = 380°C. Flash point = < 32°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 1. Practically insoluble in water.

Incompatibilities: A reducing agent; reacts violently with strong oxidizers. Keep away from strong acids and strong bases.

Potential Exposure: This material is used primarily for fungicidal and bactericidal protection of plastics. It is an organoarsenic and a heavy metal compound.

Permissible Exposure Limits in Air

arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

PAC Ver. 29[138]

PAC-1: 5 milligram per cubic meter

PAC-2: 14 milligram per cubic meter

PAC-3: 84 milligram per cubic meter

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301,#7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons. Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 10 μg/L; Connecticut 10 μg/L. Toxic pollutant designated pursuant to section 307 (a) (1) of the Clean Water Act and is subject to effluent limitations (arsenic and inorganic and organic arsenic) [40 CFR 401.15 (7/1/1987)]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. Contact with eyes may be severe. Ingestion causes nausea, vomiting, and diarrhea. Arsenic compounds are acutely poisonous by ingestion. In severe cases, there may be bloody vomitus and stools and the victim may suffer collapse and shock with weak, rapid pulse; cold sweats; coma, and death. LD_{50} = (oral-rat) 40 mg/kg.

Long-Term Exposure: Arsenic compounds are recognized carcinogens of the skin, lungs, and liver. Ingestion or inhalation may result in chronic poisoning. Symptoms may include disturbances of the digestive system; loss of appetite; cramps, nausea, constipation, and diarrhea. May cause liver damage, resulting in jaundice. May cause disturbances of the blood, kidneys, and nervous system. May cause skin abnormalities including itching, pigmentation, and even cancerous changes.

Points of Attack: Blood, kidneys, skin, and nervous system.

Medical Surveillance: Test for urine arsenic. Levels should not be greater than 100 μg/g of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. Examination of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth methods if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device?* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In the case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to physician:* For severe poisoning, BAL (British anti-Lewisite), dimercaprol, dithiopropanol (C3H8OS2) have been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Corrosive or contact hazard; store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (2) Color code—Blue: Health hazard/poison. Store in a secure poison location. (2) Color code—Blue (*carcinogen*): Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1760 Corrosive liquids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3465 Organoarsenic compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Organoarsenic compound, solid or liquid

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/60
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include arsenic and carbon oxides. *Small fires*: Dry chemical, carbon dioxide; water spray; or foam. *Large fires:* Water spray, fog, or foam. Move container from fire area if you can do so without risk. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Oxydisulfoton O:0200

Formula: $C_8H_{19}OsPS_3$

Synonyms: BAY 23323; *O*,*O*-Diethyl *S*- [2-(ethylsulfinyl) ethyl] phosphorodithioate; *O*,*O*-Diethyl*S*-[(ethylsulfinyl) ethyl]phosphorodithioate; Disulfoton disulfide; Disulfoton sulfoxide; Disyston sulfoxide; Ethylthiomelton sulfoxide

CAS Registry Number: 2497-07-6

HSDB Number: 6425

RTECS Number: TD8600000

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 219-679-1 [*Annex I Index No.:* 015-096-00-X]

Regulatory Authority and Advisory Information

Hazard Alert: Exposure can be lethal, Neurotoxin (cumulative), Combustible, Agricultural chemical.

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R24; R28; R33; R50/53; safety phrases: S1/2; S28; S36/37; S41; S45; 60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Oxydisulfoton is a combustible liquid. Molecular weight = 290.42; specific gravity (H_2O:1) = 1.22 @ 20°C; boiling point = 330°C; vapor pressure = 3.5×10^{-3} mmHg @ 25°C. Hazard identification (based on NFPA-704M Rating System): Health 4, flammability 1, reactivity 0. Highly soluble in water.

Potential Exposure: This material is an agricultural insecticide.

Incompatibilities: ***Vapor may form explosive mixture with air***. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.32 milligram per cubic meter

PAC-2: 3.5 milligram per cubic meter

PAC-3: 21 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms include the following: *Mild exposure:* Headache, loss of appetite; nausea, dizziness; *moderate exposure:* Abdominal cramps; diarrhea, salivation, and excessive tearing; muscular cramps; *severe exposure:* Fever, blue lips; lack of sphincter control; coma, heart shock; difficult breathing.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)- approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information

from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.3/0.4

Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200

Then: Protect persons downwind (mi/km)

Day 1.4/2.3

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish with dry chemical, carbon dioxide; water spray, fog, or foam. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases may be generated from the fire or runoff water. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Oxydisulfoton, Washington, DC, Chemical Emergency Preparedness Program (Nov. 30, 1987).

Oxyfluorfen O:0205

Formula: $C_{15}H_{11}ClF_3NO_4$

Synonyms: Benzene, 2-chloro-1-(3-ethoxy-4-nitrophenoxy)-4-(trifluoromethyl)-; Caswell No. 188AAA; 2-Chloro-1-(3-ethoxy-4-nitrophenoxy)-4-(trifluoromethyl)benzene; 2-Chloro-4-trifluoromethyl-3′-ethoxy-4′-nitrodiphenyl ether; 2-Chloro-α,α,α-trifluoro-*p*-tolyl-3-ethoxy- 4-nitrophenyl ether; Edger; Ether, 2-chloro-α,α,α-trifluoro-*p*-tolyl-3-ethoxy-4-nitro phenyl; Fire Power (glyphosate + oxyfluorfen); Galigan; Goal; Hadaf; Kleenup; Koltar; Mon-78095®; Oxyfluorfene; Oxyfluorofen; RH-915; RH-2915; Rout (with oryzalin); Triox

CAS Number: 42874-03-3

HSDB Number: 7507

RTECS Number: DV4725000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171; UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 255-983-0

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen

Hazard Alert: Suspected of causing genetic defects, Environmental hazard. Listed for Tier 1 screening as an endocrine disruptor[88].

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn, N; risk phrases: R45; R11, R22; R36/37/38; R50/53; safety phrases: S16; S26; S29/35; S45; S60; S61; S62 (see Appendix 4)

Description: Orange to deep red−brown crystalline solid or powder. Smoke-like odor. Molecular weight = 361.70;

specific gravity (H_2O:1) = 1.49; boiling point = (decomposes) 330°C; freezing/melting point = 85°C; vapor pressure = 2.1×10^{-7} mm @ 20°C. Henry's Law constant = 1.2×10^{-6} atm-m^3/mol @ 25°C (est)[83]. Slightly soluble in water; solubility = 0.098 ppm.

Potential Exposure: Oxyfluorfen, a diphenyl ether herbicide, is used for broad spectrum preemergence and postemergent control of annual broadleaf and grassy weeds in a variety of tree fruit, nut, vine, and field crops. The largest agricultural markets are wine grapes and almonds. Also used on ornamental and forestry sites. Oxyfluorfen is also used for weed control in landscapes, patios, driveways, and similar noncrop areas in residential, highway, and rights-of-way sites.

Incompatibilities: Decomposes >330°C releasing toxic hydrogen fluoride, hydrogen chloride, and nitrogen oxides.

Permissible Exposure Limits in Air: No standards or PAC available.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol–water coefficient: Log K_{ow} = >4.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, absorbed through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin, and respiratory tract, with burning sensation, pain, redness, and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse persperation, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, and risk of lung edema. If swallowed, face, and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. LD_{50} (oral, rat) = >5 g/kg.; LD_{50} (dermal, rat) = >10 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. Workers exposed to chlorophenoxy compounds over a 5–10 years period at levels above 10 milligram per cubic meter complained of weakness, rapid fatigue, headache, and vertigo. Liver damage, low blood pressure, and slowed heartbeat were also found. Based on animal tests, may affects human reproduction

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, spleen, kidney, and reproduction system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Diphenyl ether derivatives may react with the following absorbent materials: Cellulose-based; Expanded Polymeric[88]. Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPontTychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240 (d) (4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health hazard/poison: Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all sources of ignition and dampen spilled material with 60%−70% acetone to avoid airborne dust. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition may include hydrogen fluoride, hydrogen chloride, fluorine and oxides of nitrogen, and carbon. This chemical is a combustible solid, but does not readily ignite. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* Use dry chemical, CO_2, water spray, or regular *foam. On a large fire:* Use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small quantities may be land filled but large quantities should be incinerated. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Oxygen O:0210

Formula: O_2

Synonyms: Liquid oxygen; LOX; Oxygen, liquid

CAS Registry Number: 7782-44-7

HSDB Number: 5054

RTECS Number: RS2060000

UN/NA & ERG Number: UN1072 (compressed)/122; UN1073 (refrigerated liquid)/122

EC Number: 231-956-9 [*Annex I Index No.:* 008-001-00-8]

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Positive: V79 cell culture-gene mutation.

Hazard Alert: Strong oxidizing gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Suspected reprotoxic hazard, Suspected of causing genetic defects.

Hazard symbols, risk, & safety statements: Hazard symbol: O; risk phrases: R5; R8; R21; R62; R63; safety phrases: S2; S9; S17; S33; S38; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazardous to water.

Description: Oxygen is a colorless odorless gas or a bluish cryogenic liquid. Molecular weight = 32.00; boiling point = −183°C; freezing/melting point = −219°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Oxidizer. Slightly soluble in water. Liquid sinks and boils in water.

Potential Exposure: Compressed oxygen is used in various oxidation processes, for feedstock; and enrichment purposes; as a medicinal gas; a chemical intermediate; in oxy-acetylene welding; in metallurgy. Liquid oxygen is used as a rocket fuel. Oxygen is naturally present at a concentration of 21% in breathing air.

Incompatibilities: A strong oxidizer. Reacts violently with nearly every element, combustibles, organics, and reducing materials.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices. Minimum acceptable breathing air contains 19% oxygen.

Determination in Air: Use NIOSH Analytical Method #6601, Oxygen.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Note*: Increased pressure speeds up the toxic effects of oxygen. Drugs and chemical can also effects toxicity either positively or negatively. *Inhalation:* The air we breathe contains 21% oxygen. Normal activity requires a minimum of 19% oxygen. Breathing Up to 50% oxygen at normal pressure produced no symptoms. Breathing 100% oxygen at normal pressure produced no symptoms after 12 hours, but after 24 hours has caused weakness, dizziness, and burning in the nose and throat; fatigue, pain in joints and muscles; numbness and tingling in the arms and legs; palpitations, headache, cough, and nasal congestion; ear disturbances; nausea, vomiting, and loss of appetite; sore throat, fever, and swelling of the mucous membranes. Pressure levels greater than three times normal may cause convulsions and coma. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* Contact with liquid oxygen may cause freezing burns and tissue damage. *Eyes:* Liquid oxygen may cause freezing burns and tissue damage. *Ingestion:* Liquid oxygen may cause freezing burns in the mouth and throat.

Long-Term Exposure: Breathing of 50%−100% oxygen at normal pressure even intermittently, over a prolonged period can cause lung damage.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures to pure oxygen, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Consider chest X-ray after acute overexposure to pure oxygen.

First Aid: *Eye Contact*: With liquid oxygen -Immediately remove any contact lenses and flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. *Skin Contact*: With liquid oxygen-I. If frostbite has occurred, seek medical attention immediately; do not rub the affected areas or flush them with water. In order to prevent further tissue damage, do not attempt to remove frozen clothing from frostbitten areas. If frostbite has not occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention. *Breathing Pure Oxygen or Gases >40%* O_2; Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquefied oxygen. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Specific engineering controls are required by OSHA. See OSHA Standard 1910.104.

Respirator Selection: Entering into oxygen enriched atmospheres (greater than 21% oxygen) is highly dangerous. Consult *NFPA Code 53M.*

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Liquid oxygen must be stored to avoid contact with organic and combustible materials (such as oil, grease, and coal dust), since violent reactions occur. Open storage is preferred. Oxygen gas evaporating from liquid or from oxygen enriched environments is easily absorbed into clothing and any source of ignition (such as a static spark) can cause flash burning. Compressed oxygen cylinders must be securely stored separately from fuel cylinders. Liquid oxygen tanks should be stored outdoors. Sources of ignition, such as smoking and open flames are prohibited where oxygen is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1072 Oxygen, compressed & UN1073 Oxygen, refrigerated liquid (cryogenic liquid), Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas; 5.1-Oxidizer. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. *Liquid:* Do not absorb liquid in saw-dust or similar combustible absorbents. This is an oxidizer and a dangerous fire and explosion risk. Use water only. Do not use chemical or carbon dioxide extinguishers. NEVER direct water jet on liquid. Allow liquid oxygen spills to evaporate. A *Gas:* Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If liquid oxygen is spilled or leaked, take the following steps: Keep combustibles (wood, paper, oil, etc.) away from spill. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Oxygen is not flammable but supports combustion and greatly increases the intensity of any fire. Mixtures of liquid oxygen and any fuel are highly explosive. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. For a large fire; evacuate danger area and consult an expert. For small fire, extinguish using an agent suitable for type of surrounding fire. Oxygen itself does not burn. Do not use chemical or carbon dioxide on *liquid* oxygen. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Vent to atmosphere.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 15 ($\geq$0.09% concentration).

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Explosive, Air reactive, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, High acute toxicity-gas, Lacrimator, Strong oxidizing gas, Corrosive, Suspected of causing genetic defects, Violently water reactive.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg).

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, E, O, C; risk phrases: R5; R8, R9, R14; R20/22; R21; R23/24/25; R34; R48/23; R61; R62; safety phrases: S1; S8; S9; S16; S17; S23; S26; S28; S33; 36/37/39; S38; S43; S41; S45 (see Appendix 4)

Description: Oxygen difluoride is a colorless gas. Foul, peculiar odor. Shipped as a nonliquefied compressed gas. Molecular weight = 54.0; specific gravity (H_2O:1) = 1.9 @ −224°C; boiling point = −145°C; freezing/melting point = − 224°C; vapor pressure = 760 @ −145°C; relative vapor density (air = 1) = 1.88. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 3₩. Slightly soluble in water (slowly and dangerously reactive; may explode); solubility = 0.02%.

Potential Exposure: Oxygen difluoride is used as an oxidizer in missile propellant systems.

Incompatibilities: A strong oxidizer. Explodes on contact with steam. Violent reaction with reducing agents; combustible materials; chlorine, bromine, iodine, platinum, metal oxides; moist air; hydrogen sulfide (explosive in ambient air); hydrocarbons, water. Attacks mercury. Reacts, possibly violently, with many materials including porous materials (i.e., alumina, charcoal, and silica), mercury, and phosphorus.

Permissible Exposure Limits in Air

NIOSH IDLH = 0.5 ppm

Conversion factor: 1 ppm = 2.21 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.05 ppm/0.1 milligram per cubic meter TWA

NIOSH REL: 0.05 ppm/0.1 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 0.05 ppm/0.11 milligram per cubic meter Ceiling Concentration

PAC* Ver. 29[138]

PAC-1: 0.0075 ppm

PAC-2: **0.083**$_{\mathbf{A}}$ ppm

PAC-3: **0.25**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values. Arab Republic of Egypt: TWA 0.05 ppm (0.1 milligram per cubic meter), 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Denmark: TWA 0.05 ppm (0.1 milligram per cubic meter), 1999; Finland: STEL 0.05 ppm (0.1 milligram per cubic meter), 1999; Norway: TWA 0.05 ppm (0.1 milligram per cubic meter), 1999; the Phillipines: TWA 0.05 ppm (0.1 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 3 mg[HF]/m^3, 1999; the Netherlands: MAC 0.1 milligram per cubic meter, 2003; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.05 ppm. Several states have set guidelines or standards for oxygen difluoride in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota) to 2.0 μ/m^3 (Connecticut and Nevada) to 80,000 μ/m^3 (Virginia).

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly poisonous if inhaled. Corrosive to skin and eyes. Skin or eye contact may cause frostbite. Gas under pressure is corrosive to eyes, skin, and respiratory tract; causes burns. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure at low levels may result in severe, intractable headaches. LD_{50} (rat, inhalation) = < 3 ppm.

Points of Attack: Lungs, eyes, and skin.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); sputum cytology; white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do not rub the affected areas or flush them with water. In order to prevent further tissue damage, do not attempt to remove frozen clothing from frostbitten areas. If frostbite has not occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear-protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 ppm:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive- pressure mode). *Escape:* GmFS (APF = 50) Only nonoxidizable sorbents are allowed (not charcoal), [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-, mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Only nonoxidizable sorbents are allowed (not charcoal).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health hazard/poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Protect cylinder containers against physical damage. Do not use wood pallets. Preferably handle behind body shield, in outdoor, or open protective fences. Wear long rubber gloves, goggles, protective clothing, and SCBA. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: Oxygen difluoride, compressed Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

Oxygen difluoride, oxygen difluoride, compressed

First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 3.3/5.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 5.4/8.7

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This is a nonflammable gas, but a strong oxidizer that can increase the intensity of a fire. Thermal decomposition products may include harmful and irritating fumes. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool expos ures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray or sift on a thick layer of a (1:1) mixture of dry soda ash and slaked lime behind ashield. After mixing, spray water from an atomizer with great precaution. Transfer slowly into a large amount of water. Neutralize and drain into the sewer with sufficient water.

Regulatory Authority and Advisory Information

Carcinogenicty: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen

California Proposition 65 Chemical[102]: Cancer, 1/1/1988.

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Hormone[77]. A controlled substance [Section 202 of the Controlled Substances Act (21 U.S.C. 812)].

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R45; R21; R22; R25; R50; R62; R63; safety phrases: S1/2; S22; S23; S26; S36/37/39; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Oxymetholone is a white to pale yellow crystalline solid or powder. Odorless. Molecular weight = 332.51; freezing/melting point = 178 to 180°C; vapor pressure = 5.1×10^{-11} mmHg @ 25°C (est)[72]. Henry's Law constant = 1.5×10^{-9} atm-m^3/mol @ 25°C (est)[72] Practically insoluble in water; solubility = < 1 mg/mL @ 23°C; 5.2 mg/L @ 25°C (est)[72].

Potential Exposure: Oxymetholone is a controlled substance (US), hormone and a systemic anabolic steroid.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. May be combustible and light-sensitive.

Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.6 (est)[72]. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, dermal contact.

Harmful Effects and Symptoms

Symptoms of exposure to Oxymetholone may include cholestatic jaundice, hepatocellular neoplasms and peliosis hepatitis. Prepubertal exposure may cause phallic enlargement and increased frequency of erection. Postpubertal exposure may cause inhibition of testicular function, testicular atrophy, oligospermia, impotence, chronic priapism, epididymitis, bladder irritability, clitoral enlargement, menstrual irregularities, increased or decreased libido, excitation, insomnia, nausea, vomiting, diarrhea, leukemia, gynecomastia, deepening of the voice in women, hirsutism and male-pattern baldness in women, acne, edema, retention of serum electrolytes, and decreased glucose tolerance. It may also cause higher risk of developing liver cell tumors. Other symptoms include abnormal liver function tests, salt and water retention, and masculinization, particularly of the female fetus[101].

Short-Term Exposure: See above.

Long-Term Exposure: Oxymetholone may cause liver damage, tumors. Jaundice. Based on animal studies, it may be mutagenic and harm the unborn fetus.

Points of Attack: Liver (tumors).

Medical Surveillance: Oxymetholone is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: *Eyes*: first check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20−30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Immediately flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician and be prepared to transport the victim to a hospital for treatment. *Inhalation*: Immediately leave the contaminated area; take deep breaths of fresh air. Immediately call a physician and be prepared to transport the victim to a hospital even if no symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA should be used; if not available, use a level of protection greater than or equal to that advised under protective clothing. *Ingestion*: *Do not induce vomiting*. If the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and immediately call a hospital or poison control center. Be prepared to transport the victim to a hospital if advised by a physician. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. Do not induce vomiting. Immediately transport the victim to a hospital.

Personal Protective Methods:

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code—Blue: Health hazard/toxics/poisons: Store in a secure poison location.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition product includes oxides of carbon (carbon monoxide, CO2). Fires involving Oxymetholone can be controlled with a dry chemical, carbon dioxide or Halon extinguisher.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Description: Ozone is a colorless to blue gas. Very pungent characteristic, sulfur-like odor, associated with electrical sparks. Condenses to a blue−black liquid or crystalline solid. Molecular weight = 48.00; specific gravity (H_2O:1) = 1.96 @ 20°C; boiling point = −111.4°C; freezing/melting point = −193°C; vapor pressure = > 1 atm @ 20°C; 750 mmHg @ −112°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 3. Slightly soluble in water; solubility = 0.001% @ 0°C.

Potential Exposure: Ozone is found naturally in the atmosphere as a result of the action of solar radiation and electrical storms. It is also formed around electrical sources, such as X-ray or ultraviolet generators, electric arcs; mercury vapor lamps; linear accelerators; and electrical discharges. Ozone is used as an oxidizing agent in the organic chemical industry (e.g., production of azelaic acid); as a disinfectant for air, mold and bacteria inhibitor for food in cold storage rooms, and for water (e.g., public water supplies; swimming pools; and sewage treatment); for bleaching textiles; waxes, flour, mineral oils, and their derivatives; paper pulp; starch, and sugar; for aging liquor and wood; for processing certain perfumes; vanillin, and camphor; in treating industrial wastes; in the rapid drying of varnishes and printing inks; and in the deodorizing of feathers.

Incompatibilities: A powerful oxidizer. A severe explosion hazard when exposed to shock or heat, especially solid or liquid form. Spontaneously decomposes to oxygen under ordinary conditions; heating increases oxygen production. Reacts with all reducing agents; combustibles, organic, and inorganic oxidizable materials; and can form products that are highly explosive. Incompatible with alkenes, aniline, benzene, bromine, ether, ethylene, and hydrogen bromide; nitric oxide; stibine. Attacks metals except gold and platinum.

Permissible Exposure Limits in Air
The United States Environmental Protection Agency has set a national ambient air quality standard for ozone of 0.12 ppm (240 μ/m^3) on a 1-hour average basis and a standard for total photochemical oxidants (expressed as ozone) of 0.08 ppm (160 μ/m^3) on a 1-hour average basis (to be exceeded not more than once a year). The Czech Republic[35] has set a TWA in work-place air of 0.1 milligram per cubic meter with a ceiling of 0.2 milligram per cubic meter. Russia set a MAC for ambient air in residential areas of 0.16 milligram per cubic meter on a once-daily basis and 0.03 milligram per cubic meter on an average daily basis. State limits for ozone in ambient air[60] range from 0.005 milligram per cubic meter in Nevada to 0.235 milligram per cubic meter for Connecticut.
NIOSH IDLH = 5 ppm
OSHA PEL: 0.1 ppm/0.2 milligram per cubic meter TWA
Odor Threshold = 0.045 ppm
NIOSH REL: 0.1 ppm/0.2 milligram per cubic meter Ceiling Concentration
ACGIH TLV[1]: (*heavy work*) 0.05 ppm/0.1 milligram per cubic meter TWA; (*moderate work*) 0.08 ppm/0.16 milligram per cubic meter TWA; (*light work*) 0.01 ppm/0.2 milligram per cubic meter TWA; (*light, moderate, or heavy workload* $\leq$*2 hrs.*) 0.2 ppm/0.4 milligram per cubic meter TWA; not classifiable as a human carcinogen.
PAC Ver. 29[138]
PAC-1: 0.24 ppm
PAC-2: 1 ppm
PAC-3: 10 ppm
DFG MAK: Carcinogen Category 3B, Substances which cause concern that they could be carcinogenic for man but which cannot be assessed conclusively because of lack of data.
Arab Republic of Egypt: TWA 0.1 ppm (0.02 milligram per cubic meter), 1993; Australia: TWA 0.1 ppm

(0.2 milligram per cubic meter); STEL 0.3 ppm, 1993; Austria: MAK 0.1 ppm (0.2 milligram per cubic meter), 1999; Belgium: STEL 0.1 ppm (0.2 milligram per cubic meter), 1993; Denmark: TWA 0.1 ppm (0.2 milligram per cubic meter), 1999; Finland: TWA 0.1 ppm (0.2 milligram per cubic meter); STEL 0.3 ppm (0.6 milligram per cubic meter), 1999; France: VME 0.1 ppm (0.2 milligram per cubic meter), VLE 0.2 ppm (0.4 milligram per cubic meter), 1999; Hungary: TWA 0.2 milligram per cubic meter; STEL 0.4 milligram per cubic meter, 1993; Japan: 0.1 ppm (0.2 milligram per cubic meter), 1999; Norway: TWA 0.1 ppm (0.2 milligram per cubic meter), 1999; the Phillipines: TWA 0.1 ppm (0.2 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.1 milligram per cubic meter; MAC (STEL) 0.6 milligram per cubic meter, 1999; Russia: TWA 0.1 ppm; STEL 0.1 milligram per cubic meter, 1993; Sweden: NGV 0.1 ppm (0.2 milligram per cubic meter), TGV 0.3 ppm (0.6 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (0.2 milligram per cubic meter), KZG-W 0.2 ppm (0.4 milligram per cubic meter), 1999; Turkey: TWA 0.1 ppm (0.2 milligram per cubic meter), 1993; United Kingdom: STEL 0.2 ppm (0.4 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Determination in Air: Use OSHA Analytical Method ID-214.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May be fatal if inhaled. Irritates the eyes and respiratory tract. Eye exposure may result in conjunctivitis (red, inflamed eyes). Inhalation of the gas can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Inhalation of the gas may cause asthma-like reactions. The liquid may cause frostbite. May affect the central nervous system; causing headache and impaired concentration and performance. Signs and symptoms of acute exposure to ozone may be severe and include irritation and burns of the skin, eyes, and mucous membranes. An increased respiratory rate, shallow breathing; cough, dyspnea (shortness of breath), bronchitis, and pulmonary edema; and pulmonary hemorrhage may occur. Tachycardia (rapid heart rate) and hypotension (low blood pressure) may be observed. Neurologic effects include fatigue, dizziness, drowsiness, headache, exhilaration, and depression. Nausea, vomiting, and anorexia may occur. A level of 0.2 ppm for 3 hours did not produce symptoms. Levels of 0.3 ppm may cause tightness in chest and throat, dry throat; and irritation of throat and lungs within 30 minutes. Levels of 0.5 ppm and above produce a sulfur-like odor and may cause headache, drowsiness, loss of coordination; and accumulation of fluid in the lungs. Levels near 10 ppm may result in immediate, severe irritation of throat and lungs, excessive sweating; continual coughing; decreased blood pressure; weak and rapid pulse; and severe chemical pneumonia. Death may occur from prolonged exposures @ 2 ppm or short exposures @ 10 ppm. *Note:* There may be a delay in onset of breathing difficulties for up to 6 hours. Ozone is highly toxic via inhalation or by contact of liquid to skin, eyes, or mucous membranes. It is capable of causing acute to chronic lung damage, burns, and death or permanent injury. Ozone can be toxic at a concentration of 100 ppm for 1 minute. Ozone is capable of causing death from pulmonary edema. It increases sensitivity of the lungs to bronchoconstrictors and allergens; increases susceptibility to and severity of lung bacterial and viral infections.

Long-Term Exposure: Repeated or prolonged exposure may cause lung damage and/or chronic respiratory disease. Ozone may damage the developing fetus.

Points of Attack: Eyes, respiratory system; lungs.

Medical Surveillance: NIOSH lists the following tests: Chest X-ray, electrocardiogram, pulmonary function tests: Forced vital capacity, forced expiratory volume (1 sec); sputum cytology; white blood cell count/differential. Preemployment and periodic physical examinations should be concerned especially with significant respiratory diseases. Eye irritation may also be important. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Administer 100% O_2. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: In areas of excessive concentration, gas masks with proper canister and full facepiece or goggles or the use of supplied air respirators is recommended. Wear-protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 ppm*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *Up to 5 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece.) *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-, mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health hazard/poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry, well-ventilated place. Detached storage preferred, away from combustible material and reducing agents. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1955 Compressed gas, toxic, n.o.s, Inhalation Hazard Zone A, Hazard Class: 2.3; Labels: 2.3-Poisonousgas, 5.1-Oxidizer, Technical name required, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.3/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 2000/600
Then: Protect persons downwind (m/km)
Day 2.2/3.6
Night 5.9/9.5

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor, contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable; however, ozone can increase the intensity of an existing fire and may react with any combustible substance to cause fire or explosion. Use dry chemical. carbon dioxide, water spray; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent to atmosphere. Use a licensed professional waste disposal service to dispose of this material. All federal, state, and local environmental regulations must be observed. Return refillable compressed gas cylinders to supplier.

CHEMISTRY/TOXICOLOGY

Sittig's Handbook of
Toxic and Hazardous Chemicals and Carcinogens
Volume 2: E – O
SEVENTH EDITION

The definitive reference on hazardous chemical substances.
Comprehensive and convenient, *Sittig's Handbook* focuses on the most important hazardous chemicals in commercial use.

- The chemicals are presented alphabetically and classified as a carcinogen, hazardous substance, hazardous waste, or toxic pollutant.
- Find the chemical you are looking for quickly and reliably: entries have a full range of synonyms for each chemical, including trade names and CAS index.
- Relevant data for the United States and EU included throughout, along with the essential chemical hazard information applicable worldwide.
- The seventh edition includes more than 100 new chemical records.
- The trusted source of reliable information depended on by first-line responders (emergency services), industry, logistics companies, scientists, and environmental protection organizations.

For over 30 years, *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* has proven to be a reliable, accessible must-have reference work on hazardous materials. This updated and revised 7th edition is the most quickly accessible and comprehensive listing of the hazardous chemicals that are commonly used, transported, and regulated for use in the environment and the workplace. Information is the most vital resource anyone can have when dealing with potential hazardous substance accidents, spillages, fires, or acts of terror. It is also essential for the safe day-to-day operation of chemical processes and environmental protection. Sittig's handbook provides extensive data for over 2200 chemicals in a uniform format, enabling fast and accurate decisions in almost any situation. This new edition contains expanded and reviewed information for each chemical listed (including chemicals classified as WMDs) and has been updated to keep pace with world events, standards, and regulations.

Richard P. Pohanish is the author or co-author of 25 books and database product in the fields of hazardous material, environmental health, chemical safety, and engineering. Active in the publishing and information business for more than half a century, Mr. Pohanish, now retired, formerly held various executive positions with Van Nostrand Reinhold, including President, Information Division. His numerous published works include *Sittig's Handbook of Pesticides and Agricultural Chemicals*, 2nd Edition.

NOTICE TO BE READ BY ALL USERS OF THIS PUBLICATION

Great care has been taken in the preparation of this work and, to the best knowledge of the Publisher and the Editors, the information contained herein is factual and accurate and the opinions expressed are those of qualified experts. The data are not to be taken as a warranty or representation for which the Publisher or Editors assumes legal responsibility. Furthermore, the Publisher does not assume any responsibility or liability for the accuracy or completeness of, or consequences from, such information. Data are offered in this work are solely for your consideration, investigation, and verification. Mention of trade names or commercial products in the work does not constitute endorsement or recommendation for use by the Publisher or Editors.

This reference work is intended to provide information about chemical hazards and guidelines for those trained in the use and storage of hazardous materials, as well as those trained to respond to spills, leaks, and accidents involving those materials. The work is not intended as a primary source of research information. As with any reference, it cannot include all information or discuss all situations that might occur. It cannot be assumed that all necessary warnings and precautionary measures are contained in this work; other, or additional, information or assessments may be required. Most of all, it cannot replace the expertise, and experience of trained professionals or qualified responders.

As information may not be available for some chemicals, an absence of data does not necessarily mean that a substance is not hazardous. For major incidents, it will be necessary to obtain additional detailed information from other resources as well as more expertise from those with extensive training. Neither the Publisher nor the Editors assume any liability or responsibility for completeness or accuracy of the information presented or any damages of any kind alleged to result in connection with, or arising from, the use of this work.

Final determination of the suitability of any information for use contemplated by any user of this work, and the manner of that use, is the sole responsibility of the user. Any use of these data and information must be determined by the user to be in accordance with applicable federal, state, territory, and local laws, and regulations. The Publisher and Editors recommend that anyone intending to use any toxic, hazardous chemical, and/or carcinogenic material mentioned in this work, should satisfy themselves as to such suitability, and that the user can meet all applicable safety and health standards. The Publisher and the Editors strongly encourage all readers, and users of chemicals, to adhere to and follow the manufacturers' or suppliers' current instructions, technical bulletins, and material safety data sheets for specific use, handling, protection (including the use of personal protective equipment and eye protection), and storage of all chemical materials. The Publisher and Editors also strongly recommend that users obtain expert advice before implementing procedures involving any hazardous chemicals, materials, or carcinogens.

Contents

Preface

For more than 35 years *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* has continued to serve an ever-widening audience of users. It has been proven to be among the most easy-to-use and essential reference works on hazardous materials. The 7th edition has been updated and expanded, once again, to keep pace with world events and to respond to the ever-expanding need for reliable information on chemicals used in the workplace and the tool shed.

Most users of this work understand the potential dangers of chemicals. Hazardous and toxic substances pose a wide range of health hazards, including irritation, sensitization, and carcinogenicity. Chemicals can possess physical properties of flammability, explosion and corrosion. Many chemicals can harm the environment by poisoning aquatic and plant life.

The chemical industry and its many component businesses are forced to strike a delicate balance because the same properties that make a chemical substance highly useful can also make it extremely harmful. We are told by some industrialists that toxic chemicals are present in nature and that industrial contributions are just the price we have to pay for progress. There is little argument about the chemical industry's critical place in the nation's economy. The United States is the number one chemical producer in the world, generating more than $550 billion a year and employing more than 5 million people. So, somewhere in between lies the truth—or at least an area in which we can function. Information is vital in a world where virtually every aspect of our lives is touched by chemical hazards.

Each year, in the United States, over 2 billion tons of hazardous and toxic chemicals are manufactured. Including imports, more than 3 billion tons are transported employing 800,000 shipments each day. It is estimated that 1.3 billion tons are moved by truck and hundreds of billions of pounds of these hazardous materials are transported through populated areas. The average American household generates approximately 15 pounds of hazardous waste per year. Nearly five million poisonings occur in the United States annually, resulting in thousands of deaths. Based on 2004 TRI data (publically released April 2006), over 4 billion pounds of toxic chemicals are released into the nation's environment each year, including 72 million pounds of recognized carcinogens from nearly 24,000 industrial facilities.

Chemical accidents and spills can range from small to large and can occur anywhere chemicals are manufactured, transported, stored or used. Today's media headlines constantly point out both the information gaps and the need for constantly updated information. On January 9, 2014, for example, an estimated 10,000 gallons[CDC,NTP] of chemicals used to process coal spilled from a damaged 45,000 gallon storage tank into the Elk River in the US state of West Virginia. As the news of the spill developed, it became clear to the public (and many experts) that federal and state officials had sparse data about the health risks of the two potentially toxic organic solvents involved in the spill: primarily crude 4-methylcyclohexanemethanol and a minor component of mixed glycol ethers consisting of glycol phenyl ether and dipropylene glycol phenyl ether. The latter mixture of chemicals was not reported by the manufacturer to the public until 12 days after the initial spill. The unfortunate truth is that the Elk River is a municipal water source that serves approximately 300,000 people in and around Charleston, the state capitol. For weeks following the spill, residents were instructed not to drink or bathe with local tap water.

The problem of toxic chemicals in the United States; and, indeed, in all the world frightens many people. Over the years, these fears are heightened by news stories such as the huge accidental plant fire in Saudi Arabia that killed at least 12 people and injured another dozen (April 2016); the huge explosion at a vinyl chloride plant in Coatzacoalcos, Mexico—A few days later (also April 2016) that killed 24 workers and injured 136; the worst environmental disaster in Vietnam history caused by a chemical spill of cyanide, phenols and iron hydroxide which poisoned tons of marine life and killed people along 120 miles of coastline and stretching some 20 nautical miles out to sea (June 2016); the chemical plant explosion and subsequent spill of highly flammable liquids in Guizhou Province, China (February 2012) that killed more than 20 people and forced the evacuation of almost 30,000. Whether the chemical involves an aluminum dust explosion (Huntington, IN, 2003), a fertilizer explosion in West Texas (April 2013) leads in the water supply (Flint, MI, 2016), the massive Deepwater Horizon oil spill (Gulf of Mexico, 2010), or older problems—Bhopal, India, Love Canal, New York, the disastrous Valley of the (100,000) Drums (Kentucky), the Valley of Death in Brazil, and the like−these incidents generate emotional responses, often from people uninformed about science or technology and confirm the charge of critics that chemicals are "accidents waiting to happen."

In 2001, the 4th Edition of *Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens* was published shortly before the tragic events of the morning of September 11. The decade that followed brought many changes to life in the civilized world. The United States government, for example, established the Department of Homeland Security and enacted laws such as the *Chemical Facilities Security Act of 2003.* These actions were prompted by concerns involving infrastructure protection and the anticipation of another attack, possibly on the nation's chemical and energy facilities or by using trucks

or tank cars that transport highly dangerous and possibly lethal chemicals. "These facilities are found around the country in industrial parks, in seaports, and near the major population centers. Dangerous chemicals routinely travel along our highways, inland waterways, and on railcars that pass through the heart of major cities including Washington, D.C., just a short distance from Capitol Hill. Terrorist attacks on the US chemical industry have the potential to kill tens of thousands of Americans and seriously injure many more. In many instances, these attacks hold the potential for having a cascading effect across other infrastructures, particularly in the energy and transportation sectors. This is both because of the damage that can be caused by the attack, and the enormous expense and effort associated with the clean-up to an affected area in its aftermath."[83] To put it more simply, using the same low tech/ high concept approach that turned passenger planes into missiles, terrorists do not need to produce or amass chemical weapons or smuggle them into the United States in order to produce great damage.

"Commercial chemical incidents occur tens of thousands of times each year, often with devastating and exorbitantly expensive consequences. They are indiscriminate in their effects. Workers, companies, the public, emergency response organizations, and all levels of government pay the figurative and literal price. Yet, until now and with few exceptions, chemical incidents have been invisible. Perhaps it is due to their pervasiveness, or to the common tendency to overlook what is taken for granted."[84] This quote is from the highly publicized *600K Report* prepared by the Chemical Safety and Hazard Investigation Board (CSB), an independent, nonpartisan, quasi-legislative US government agency. The CSB described our nation's lack of definitive knowledge of the "big picture" surrounding chemical incidents as "… the industrial equivalent of two 737 airplanes "crashing" year after year, killing all passengers (256 people) without anyone seeming to notice."[84]

Almost 40 years ago, the United States Government Accounting Office (GAO) estimated that 62,000 chemicals were in commercial use. Today, that number has grown to beyond 82,000.

Given the reality of problems inherent to chemical hazards, including accidents and spills, the advent of new threats to our way of life, and the challenges of communicating complex data, it is the goal of this work to provide data so that responsible decisions can be made by all who may have contact with chemicals covered in this reference work. With this in mind the work can be used by those in the following chemical fields and related professions:

Applied research and product development
Attorneys
Campus safety and health
Certified chemical hygiene officer (CCHO)
Chemical engineering
Chemical health and safety
Chemical informatics and information management
Chemicals manufacturers and distributors
Chemical technology
Certified hazardous materials manager (CHMM)
Certified health physicist (CHP)
Certified industrial hygienist (CIH)
Certified safety professional (CSP)
Dyes, pigments and inks
Emergency response personnel
Environmental protection and management
Forensic chemistry
Formulation chemistry
Hazardous waste management
Industrial management
Laboratory management
Loss control management
Pesticide distributors
Process chemistry
Process safety
Project management
Public information and outreach
Public health
Quality control and assurance
Regulatory affairs
Researchers
Science policy
Technical communications
Technical support
Toxicology
Water chemistry

The chemicals chosen for inclusion are officially recognized substances, many identified as carcinogens, as belonging to some designated category of hazardous or toxic materials; with numerically defined safe limits in air in the workplace, ambient air, water; in waste effluents. For the most part these are materials of commerce that can be heavily used and may be transported in bulk.

The 7th edition contains more chemicals and data for each material. In keeping with the broad changes initiated with the fourth edition, contents of the 7th edition are focused on the concept of "regulated chemicals." The carcinogen potential of each chemical was compared to listings and reports from eminent authorities as the International Agency for Research on Cancer (IARC), the US National Toxicology Program (NTP) and the US Environmental Protection Agency.

The "Regulatory Authority and Advisory Bodies" section contains new items including, where available, EPA Gene-Tox Program findings, and many of the individual listings now contain useful advice sought after by the regulated community. As a result, the new volume should be even

more practical for those users of specific chemicals, and to those concerned with both adherence to, and enforcement of, regulations.

Data is furnished, to the extent currently available, in a uniform multisection uniform format to make it easy for users who must find information quickly and/or compare the data contained within records, in any or all of these important categories:

Chemical Name and Record Number
Chemical Formula
Synonyms (including trade names)
Code Numbers (including CAS Registry, HSDB, RTECS, UN/NA & ERG, EC)
Regulatory Authority and Advisory Information (summary)
Description (including physical properties, explosion and fire data and water reaction and solubility)
Potential Exposure
Incompatibilities
Permissible Exposure Limits in Air
Determination in Air
Permissible Concentration in Water
Determination in Water
Routes of Entry
Short-Term Exposure
Long-Term Exposure
Points of Attack
Medical Surveillance
First Aid
Decontamination (selected records)
Personal Protective Methods
Respirator Selection
Storage
Shipping
Spill Handling
Fire Extinguishing
Disposal Method Suggested
References

A Brief history of this work

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens was first published more than 35 years ago. This work continues to provide first responders and occupational and environmental health and safety professionals with an accessible and portable reference source. Based on a count of CAS numbers, the seventh edition of this handbook contains data on almost 2600 toxic and hazardous chemicals (up from nearly 600 in the first edition, nearly 800 in the second edition, nearly 1300 in the third edition, and nearly 1500 in the fourth edition, and 2200 in the sixth edition).

According to the United State Library of Congress, the history of the project is as follows: 1st edition published in 1981; 2nd edition published in 1985; 3rd edition published in 1991; 4th edition published in 2001; 5th edition November 2007; 6th edition 2012, 7th edition: 2017.

Acknowledgments

The compilation of this 7th edition could not have been realized without the contributions of many of the researchers, scientists, contract employees and institutions that developed the excellent documents and databases that provided so much of the essential data that appear in this work. A full list of these contributors is impossible to compile. Nevertheless, In no particular order, I wish to acknowledge the those associated with US Environmental Protection Agency (EPA); United States Department of Labor; Occupational Safety and Health Administration (OSHA); Department of Health and Human Services; National Institute for Occupational Safety and Health (NIOSH); US Department of Energy (DOE); Agency for Toxic Substances and Disease Registry (ATSDR); American Conference of Governmental Industrial Hygienists (ACGIH); Deutsche Forschungsgemeinschaft (DFG); Centers for Disease Control and Prevention (CDC); NOAA; United States National Library of Medicine (NLM) National Institutes of Health (NIH); Hazardous Substance Data Bank (HSDB) and (TOXNET); US Department of Health and Human Services, Public Health Service, National Toxicology Program (NTP); Federal Emergency Management Agency (FEMA); US Department of Transportation (DOT); US Coast Guard (USCG); National Fire Protection Association (NFPA); International Agency for Research on Cancer; (IARC); New Jersey Department of Health and Senior Services; Chemical Safety and Hazard Investigation Board (CSB); United Nations Environment Programme; the states of New York and New Jersey, and many other government organizations, organizations and companies. It is nearly impossible to express the extent of my gratitude to all of them for their contributions to my research.

Although every effort has been made to produce an accurate and highly useful handbook, the editors and Publisher appreciates the need-for constant improvement. Any comments, corrections, or advice from users of this book are welcomed by the author who asks that all correspondence be submitted in writing and mailed directly to the publisher who will maintain a file for reprints and future editions.

How to Use This Book

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens focuses on critical data for more than 2600 commercially important, regulated and hazardous, to one degree or another, substances. A large number of these chemicals are known or suspected potentially dangerous carcinogens. Many are found in the workplace and fewer are found in the medical and research fields. Some are found in home basements and worksheds. For the most part, importance is defined by inclusion in official, regulatory, and advisory listings. Much of this information, found in US government sources, has been supplemented by a careful search of many publications and databases.

This handbook is becoming more encyclopedic in nature. When one looks at many, if not most published works in this field, the user simply expects to find numerical data. Here, we have tried, wherever possible, to provide useful descriptive material and references which hopefully opens the door to additional of published materials.

Nevertheless, this is not a seminal research work and it is recommended that this book be used as a guide. This work is not meant to be a substitute for workplace hazard communication programs required by regulatory bodies such as OSHA, and/or any other United States or international government agencies. If data are required for legal purposes, the original source documents [such as Code of Federal Regulations (CFR)], appropriate Federal and State agencies, which are often referenced, should be consulted.

In the pages which follow, the following categories of information will be presented, for each chemical record, discussed with reference to scope, sources, nomenclature employed, and the like. Omission of a category generally indicates a lack of available information.

Chemical name: Each record is arranged alphabetically by a chemical name. These are names used by regulatory and advisory bodies. In very few cases the name may be a popularly-used product name or trade name. The chemical name section of each chemical record is backed-up with the "Synonyms" section and Appendix 5, "Synonym and Trade Name-Cross Index."

Formula: Generally, this has been limited to a commonly used one-line empirical or atomic formula. In the *Molecular Formula* field, the Hill system has been used showing number of carbons (if present), number of hydrogens (if present), followed by alphabetically listed element (s). Multiple carbon−carbon (double and triple) bonds have been displayed where appropriate.

Synonyms: This section contains scientific, product, trade, and other synonym names that are commonly used for each hazardous substance. Some of these names are registered trade names. Some are provided in other major languages other than English, including Spanish, French, and German. In some cases, "trivial" and nicknames (such as MEK for methyl ethyl ketone) have been included because they are commonly used in general communications, especially in the workplace. This section is important because the various "regulatory" lists published by federal, state, international agencies and advisory bodies do not always use the same name for a given hazardous substance. Every attempt has been made to ensure the accuracy of the synonyms and trade names found in this work, but errors of highly complex names are inevitable in compilations of this magnitude. Please note that this work may not include the names of all products currently found in commerce, particularly mixtures that may contain ingredients that are regulated chemicals.

The synonym index contains all synonym names listed in alphabetical order. It should be noted that organic chemical prefixes and interpolations such as (α-) alpha-, (β-) beta-, (γ-) gamma-, (δ-) delta-, (o-) ortho-, (m-) meta-; (p-) para-; sec- (secondary-), trans-, cis-, (n-) normal-, and numbers (1-; 1,2-), etc. are not used when searching for a chemical name. In other words, these prefixes are not treated as part of the chemical name for the purposes of alphabetization. Users should use the substance name without the prefix. For example, to locate *n*-butane, search for butane; to locate 3,3′-dichlorobenzidine; search for dichlorobenzidine; and to locate *α*-cyanotoluene or *alpha*-cyanotoluene, search for cyanotoluene. *Note*: All product names, company names, trademarks, and brands are the registered property of their respective owners. All company, product and service names used in this work are for identification purposes only. Use of these names, logos, and brands does not imply endorsement by the Author, Editors or the Publisher.

CAS Registry Number: The Chemical Abstracts Service (CAS) number is a unique identifier assigned to each chemical registered with the CAS of the American Chemical Society. This number is used to identify chemicals on the basis of their molecular structure. CAS numbers, in the format "nnn-nn-n" [two or more numeric characters (dash) two numeric characters (dash) followed by a single numeric check digit]. CAS numbers should always be used in conjunction with substance names to insure positive identification and to avoid confusion with like-sounding names, i.e., benzene (71-43-2) and benzine (8032-32-4). This 7th edition contains some alternate CAS numbers that may now be considered related, retired, obsolete and/or widely and incorrectly used in the literature. In this section, the first CAS number(s), before the abbreviation "alt." for the word "alternate," is considered (based on several sources) to be the correct CAS number(s). Ultimately, it is the responsibility of the user to find and use the correct number. *Note*: CAS Registry Number is a Registered Trademark of the American Chemical Society.

HSDB Number: HSDB is a toxicology data file on the National Library of Medicine's (NLM's) Toxicology Data Network (TOXNET). HSDB is organized into individual chemical records, and contains over 5000 such records. HSDB is a database focused primarily on the toxicology of potentially hazardous chemicals. The information in HSDB has been assessed by a Scientific Review Panel. Using your computer browser and entering a search such as "HSDB (followed by the Number)" should take you to the exact record you are seeking.

RTECS Number: RTECS (Registry of Toxic Effects of Chemical Substances) is a compendium of data extracted from the open scientific literature. The data are recorded in the format developed by the RTECS staff at NIOSH and arranged in alphabetical order by prime chemical name.[NIOSH] The RTECS numbers are unique identifiers assigned NIOSH. The RTECS number in the format "AAnnnnnnn" (two alphabetic characters followed by seven numeric characters) may be useful for online searching for additional toxicologic information on specific substances. It can, for example, be used to provide access to the MEDLARS computerized literature retrieval services of the NLM in Washington, DC. The RTECS number and the CAS number can serve to narrow down online searches. The RTECS Database is currently available from a growing list of "value-added" vendors that are listed on the Internet from NIOSH or CDC. In the US 1-800-232-4636; Outside the US 1-513-533-8328 or by Email: cdcinfo@cdc.gov.

UN/NA & ERG Number: United Nations-North America numbers are four-digit numbers that identify an individual chemical or group of hazardous substances, chemicals or articles (such as explosives, corrosive substances, pesticides, grenades, etc.) with similar characteristics. These four-digit numbers are normally preceded by UN or NA (e.g., UN1759-NA1759). UN/NA numbers are required to appear on shipping documents, and are often displayed on warning labels, the exterior of packages, and on specified containers such as truck or railway placards. These ID (identification) numbers may also be called NA (North American) numbers or DOT (Department of Transportation) numbers.[cameo] UN numbers are assigned by the United Nations Committee of Experts on the Transport of Dangerous Goods. Identification numbers containing a UN prefix (United Nations numbers) are authorized for use with all international shipments of hazardous materials. NA numbers are assigned by the United States DOT and usually correspond closely, but not always precisely, to the UN listing. The "NA" prefix is used for shipments between Canada and the United States *only*, and may *not* be used for other international shipments. Some chemicals without an assigned UN number may have an NA number. These latter NA numbers are usually in the format and range of NA8000−NA9999. Use of these ID numbers for hazardous materials will (1) serve to verify descriptions of chemicals; (2) provide for rapid identification of materials when it might be inappropriate or confusing to require the display of lengthy chemical names on vehicles; (3) aid in speeding communication of information on materials from accident scenes and in the receipt of more accurate emergency response information; and (4) provide a means for quick access to immediate emergency response information in the *North American Emergency Response Guidebook* (ERG) and also in the international publication, *Recommendations on the Transport of Dangerous Goods*, also known as the *Orange Book*.

EC Number: The European Commission number is a seven digit identification code used in countries of the European Union (EU) for commercially available chemical substances within the EU. This number is an identification number (ID) from *European Inventory of Existing Commercial Chemical Substances*, published by the European Environment Agency, Copenhagen, Denmark. The EC number supercedes the outmoded EINECS, ELINCS and NLP numbers. This section also includes "Annex I, Index Number" for the Export and Import of Dangerous Chemicals found in Annex I of Regulation (EC) No. 689/2008.

Regulatory Authority and Advisory Bodies:

This section contains a listing of major regulatory and advisories for the chemical of concern, including, but not limited to, Homeland Security, OSHA, US EPA, DFG (Germany), US DOT, ACGIH, IARC, NTP, WHMIS (Canada) and the EC, etc. Many law or regulatory references in this work have been abbreviated. For example, Title 40 of the CFR, Part 261, subpart 32 has been abbreviated as 40CFR261.32. The symbol "§" may be used as well to designate a "section" or "part."

- United States Department of Homeland Security. Includes "chemicals of interest" from The Chemical Facility Anti-Terrorism Standards (CFATS Act of 2014) program and the *Federal Register*, Appendix A, including all provisions of 6 CFR Part 27, including § 27.210(a)(1)(i). In developing the list, the DHS looked to existing expert sources of information including other federal regulations related to chemicals, including the following: chemicals covered under the United States Environmental Protection Agency's Risk Management Program. Chemicals included in the Chemical Weapons Convention. Hazardous materials, such as gases that are poisonous by inhalation. Explosives regulated by the DOT. The Department of Homeland Security has identified three security issues related to chemicals: *Release*—Toxic, flammable, or explosive chemicals or materials that, if released from a facility, have the potential for significant adverse consequences for human life or health. *Theft or Diversion*—Chemicals or materials that, if stolen or diverted, have the potential to be misused as weapons or easily converted into weapons using chemical

manipulation and techniques and related equipment with the intent of creating significant adverse consequences for human life or health. *Sabotage or Contamination*—Chemicals or materials that, if mixed with other and possibly readily available materials, have the potential to create significant adverse consequences for human life or health. Also considered were these security issues as well as to determine their potential future inclusion in the final version of Appendix A, and/or coverage under *Chemical Facility Anti-Terrorism Standards: Critical to Government Mission*—Chemicals or facilities the loss of which could create significant adverse consequences for national security or the ability of the government to deliver essential services, and *Critical to National Economy*—Chemicals or facilities the loss of which could create significant adverse consequences for the national or regional economy.

- Carcinogenicity: lists known and suspected human carcinogens, the agency making such a determination, the nature of the carcinogenicity. The following lists and agencies were consulted: *US Department of Health and Human Services 13th Report on Carcinogens (10/2/2014)*. United States Environmental Protection Agency: US EPA's general categories recognized by the 2005 guidelines are as follows: *Group A*: Carcinogenic to Humans: Agents with adequate human data to demonstrate the causal association of the agent with human cancer (typically epidemiologic data). *Group B*: Probably Carcinogenic to Humans: Agents with sufficient evidence (i.e., indicative of a causal relationship) from animal bioassay data, but either limited human evidence (i.e., indicative of a possible causal relationship, but not exclusive of alternative explanations; Group B1), or with little or no human data (Group B2). *Group C*: Possibly Carcinogenic to Humans: Agents with limited animal evidence and little or no human data. *Group D*: Not Classifiable as to Human Carcinogenicity: Agents without adequate data either to support or refute human carcinogenicity. *Group E*: Evidence of Noncarcinogenicity for Humans: Agents that show no evidence for carcinogenicity in at least two adequate animal tests in different species or in both adequate epidemiologic and animal studies.[USEPA] US Department of Health and Human Services *13th Report on Carcinogens (RoC)*, (2014), a science-based document prepared by the National Toxicology Program (NTP) that identifies chemical, biological, and physical agents that are considered cancer hazards for people living in the United States. IARC (International Agency for Research on Cancer),[12] are classified as to their carcinogenic risk to humans by IARC as follows: Group 1: Human Carcinogen; Group 2A: Probable Human Carcinogen; Group 2B: Possible Human Carcinogen.
- Chemicals on California's Proposition 65 List, revised as of September 30, 2016. Officially known as the Safe Drinking Water and Toxic Enforcement Act of 1986. The proposition requires that the Governor protect the state's drinking water sources from being contaminated with chemicals known to cause cancer, birth defects or other reproductive harm, and to revise and republish at least once per year a list of such chemicals. It also requires businesses to inform Californians about exposures to chemicals on the revised list[OEHHA].
- This 7th edition contains a brief summary labeled "Hazard Alert". The purpose of this section is to quickly notify users of specific dangers related to each chemicals of interest. Following is a *sample* of warnings appearing in this section: Asphyxiation hazard • Combustible liquid • Contains gas under pressure • may explode if heated • Endocrine disruptors (high/medium/low, where available) • Dangerous nerve agent • Extremely flammable gas • Flammable liquid • Frostbite/Cryogenic burn hazard • Poison inhalation hazard: exposure can be lethal • Polymerization hazard (high) • Polymerization hazard $>$ 30°C • Possible risk of forming tumors • Primary irritant (w/o allergic reaction) • Sensitization hazard (skin, respiratory) • Suspected of causing genetic defects • Suspected reprotoxic hazard • Environmental hazard, etc. *Warning*: This section is merely a guide and does not purport to be complete for every chemical covered in this work.
- A banned or severely restricted product as designated by the United Nations[13] or by the US EPA Office of Pesticide Programs under FIFRA (Federal Insecticide, Fungicide and Rodenticide Act).[14]
- A substance with an air pollutant standard set or recommended by OSHA and/or NIOSH,[58] ACGIH,[1] DFG.[3] The OSHA limits are the enforceable pre-1989 PELs. The transitional limits that were vacated by court order have not been included. However, the vacated limits are used and enforced by some states. Some airborne limits, for example, such as those from NIOSH and ACGIH are recommendations that do not carry the force of law.
- A substance whose allowable concentrations in workplace air are adopted or proposed by the American Conference of Government Industrial Hygienists

(ACGIH),[1] DFG [Deutsche Forschungsgemeinschaft (German Research Society)].[3] Substances whose allowable concentrations in air and other safety considerations have been considered by OSHA and NIOSH.[2] Substances which have limits set in workplace air, in residential air, in water for domestic purposes or in water for fishery purposes as set forth by the former USSRUNEP/IRPTC Project.[43]

- Substances that are specifically regulated by OSHA under 29CFR1910.1001 to 29CFR1910.1050
- Highly hazardous chemicals, toxics, and reactives regulated by OSHA's "*Process Safety Management of Highly Hazardous Chemicals*" under 29CFR1910.119, Appendix A. Substances that are Hazardous Air Pollutants (Title I, Part A, § 112) as amended under 42USC7412. This list provided for regulating at least 189 specific substances using technology-based standards that employ Maximum Achievable Control Technology (MACT) standards; and, possibly health-based standards if required at a later time. § 112 of the Clean Air Act (CAA) requires emission control by the EPA on a source-by-source basis. Therefore, the emission of substances on this list does not necessarily mean that a firm is subject to regulation.
- Regulated Toxic Substances and Threshold Quantities for Accidental Release Prevention. These appear as Accidental Release Prevention/Flammable Substances, Clean Air Act (CAA) §112(r), Table 3, TQ (threshold quantity) in pounds and kilograms under 40 CFR68.130. The accidental release prevention regulations applies to stationary sources that have present more than a threshold quantity of a CAA § 112(r) regulated substance.
- Clean Air Act (CAA) Public Law 101−549, Title VI, *Protection of Stratospheric Ozone*, Subpart A, Appendix A, class I and Appendix B, Class II, Controlled Substances, (CFCs) Ozone depleting substances under 40CFR82.
- Clean Water Act (CWA) Priority toxic water pollutants defined by the US Environmental Protection Agency for 65 pollutants and classes of pollutants which yielded 129 specific substances.[6]
- Chemicals designated by EPA as "Hazardous Substances"[4] under the Clean Water Act (CWA) 40CFR116.4, Table 116.4A.
- Clean Water Act (CWA) § 311 Hazardous Materials Discharge Reportable Quantities (RQs). This regulation establishes reportable quantities for substances designated as hazardous (see §116.4, above) and sets forth requirements for notification in the event of discharges into navigable waters. Source: 40 CFR117.3, amended at 60FR30937.
- Clean Water Act (CWA) § 307 List of Toxic Pollutants. Source: 40CFR401.15.
- Clean Water Act (CWA) § 307 Priority Pollutant List. This list was developed from the List of Toxic Pollutants classes discussed above and includes substances with known toxic effects on human and aquatic life, and those known to be, or suspected of being, carcinogens, mutagens, or teratogens. Source: 40CFR423, Appendix A.
- Clean Water Act, § 313 Water Priority Chemicals. Source: 57FR41331.
- RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic with Regulatory levels in mg/L. Source: 40CFR261.24.
- RCRA Hazardous Constituents. Source: 40CFR261, Appendix VIII. Substances listed have been shown, in scientific studies, to have carcinogenic, mutagenic, teratogenic or toxic effects on humans and other life forms. This list also contains RCRA waste codes. The words, "waste number not listed" appears when a RCRA number is NOT provided in Appendix VIII.

Characteristic Hazardous Wastes

Ignitability	A nonaqueous solution containing less than 24% alcohol by volume and having a closed cup flash point below 60°C/140°F using Pensky−Martens tester or equivalent An ignitable compressed gas A nonliquid capable of burning vigorously when ignited or causes fire by friction, moisture absorption, spontaneous chemical changes at standard pressure and temperature An oxidizer. See §261.21
Corrosivity	Liquids with a pH equal to or less than 2 or equal to or more than 12.5 or which corrode steel at a rate greater than 6.35 mm (0.25 in.) per year @ 55°C/130°F. See §261.22
Reactivity	Unstable substances that undergo violent changes without detonating Reacts violently with water or other substances to create toxic gases Forms potentially explosive mixtures with air. See §261.23
Toxicity	A waste that leaches specified amounts of metals, pesticides, or organic chemicals using Toxicity Characteristic Leaching Procedure (TCLP). See §261, Appendix II, and §268, Appendix I. **Listed Hazardous Wastes**

"F" wastes	Hazardous wastes from nonspecific sources §261.31
"K" Wastes	Hazardous wastes from specific sources §261.32
"U" Wastes	Hazardous wastes from discarded commercial products, off-specification species, container residues §261.34. Covers some 455 compounds and their salts and some isomers of these compounds
"P" Wastes	Acutely hazardous wastes from discarded commercial products, off-specification species, container residues §261.33. Covers some 203 compounds and their salts plus soluble cyanide salts

Note: If a waste is not found on any of these lists, it may be found on state hazardous waste lists.

RCRA Maximum Concentration of Contaminants for the Toxicity Characteristic. Source: 40CFR261.24, Table I. These are listed with regulatory level in mg/L and "D" waste numbers representing the broad waste classes of ignitability, corrosivity, and reactivity.

EPA Hazardous Waste code(s), or RCRA number, appears in its own field. Acute hazardous wastes from commercial chemical products are identified with the prefix "P." Nonacutely hazardous wastes from commercial chemical products are identified with the prefix "U."

RCRA Universal Treatment Standards. Lists hazardous wastes that are banned from land disposal unless treated to meet standards established by the regulations. Treatment standard levels for wastewater (reported in mg/L) and nonwastewater [reported in mg/kg or mg/L TCLP (Toxicity Characteristic Leachability Procedure)] have been provided. Source: 40CFR268.48 and revision, 61FR15654.

RCRA Ground Water Monitoring List. Sets standards for owners and operators of hazardous waste treatment, storage, and disposal facilities, and contains test methods suggested by the EPA (see Report SW-846) followed by the Practical Quantitation Limit (PQL) shown in parentheses. The regulation applies only to the listed chemical; and, although both the test methods and PQL are provided, they are *advisory only*. Source: 40CFR264, Appendix IX.

Safe Drinking Water Act (SDWA) Maximum Contaminant Level Goals (MCLG) for Organic Contaminants. Source: 40CFR141 and 40CFR141.50, amended 57FR31776.

- Maximum Contaminant Levels (MCL) for Organic Contaminants. Source: 40CFR141.61.
- Maximum Contaminant Level Goals (MCLG) for Inorganic Contaminants. Source: 40CFR141.51.
- MCL for Inorganic Contaminants. Source: 40CFR141.62.
- MCL for Inorganic Chemicals. The MCL for arsenic applies only to community water systems. Compliance with the MCL for arsenic is calculated pursuant to §141.23. Source: 40CFR141.11.
- Secondary Maximum Contaminant Levels (SMCL). Federal advisory standards for the states concerning substances that effect physical characteristics (i.e., smell, taste, color, etc.) of public drinking water systems. Source: 40CFR143.3.
- CERCLA Hazardous Substances ("RQ" Chemicals). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.
- Releases of CERCLA hazardous substances in quantities equal to or greater than their reportable quantity (RQ), are subject to reporting to the National response Center under CERCLA. Such releases are also subject to state and local reporting under §304 of SARA Title III (EPCRA). CERCLA hazardous substances, and their reportable quantities, are listed in 40CFR302, Table 302.4. RQs are shown in pounds and kilograms for chemicals that are CERCLA hazardous substances. For metals listed under CERCLA (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, thallium, and zinc), no reporting of releases of the solid is required if the diameter of the pieces of solid metal released is 100 μm (0.004 in.) or greater. The RQs shown apply to smaller particles.
- EPCRA §302 Extremely Hazardous Substances (EHS). From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. The presence of Extremely Hazardous Substances in quantities in excess of the Threshold Planning Quantity (TPQ), requires certain emergency planning activities to be conducted. The Extremely Hazardous Substances and their TPQs are listed in 40CFR355, Appendices A and B. For chemicals that are solids, there may be two TPQs given (e.g., 500/10,000). In these cases, the lower quantity applies for solids in powder form with particle size less than 100 μm; or, if the substance is in solution or in molten form. Otherwise, the higher quantity (10,000 pounds in the example) TPQ applies.
- EPCRA §304 Reportable Quantities (RQ). In the event of a release or spill exceeding the reportable quantity, facilities are required to notify State Emergency Response Commissions (SERCs) and Local Emergency Planning Committees (LEPCs). From Consolidated List of Chemicals Subject to the

Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*.

- EPCRA § 313 Toxic Chemicals. From Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and § 112(r) of the Clean Air Act, as Amended. Source: EPA 550-B-98-017 *Title III List of Lists*. Chemicals on this list are reportable under §313 and §6607 of the Pollution Prevention Act. Some chemicals are reportable by category under §313. Category codes needed for reporting are provided for the EPCRA§313 categories. Information and Federal Register references have been provided where a chemical is subject to an administrative stay, and not reportable until further notice.
- From "*Toxic Chemical Release Inventory Reporting Form R and Instructions, Revised 2005 Version*," EPA document 260-B-06-001 was used for *de minimis* concentrations, toxic chemical categories.
- Chemicals which EPA has made the subject of Chemical Hazard Information Profiles or "CHIPS" review documents.
- Chemicals which NIOSH has made the subject of "Information Profile" review documents on "Current Intelligence Bulletins."
- Carcinogens identified by the National Toxicology Program of the US Department of Health and Human Services at Research Triangle Park, NC.[10]
- Substances regulated by EPA[7] under the major environmental laws: Clean Air Act, Clean Water Act, Safe Drinking Water Act, RCRA, CERCLA, EPCRA, etc. A more detailed list appears above. Substances with environmental standards set by some international bodies including those in Europe and Canada.[43]
- Hazard Symbols, Risk Phrases, and Safety Phrases. Explanation of these symbols and phrases can be found in Appendix 4. In the year 2018 it is expected that the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) will be phased in by many countries. Hazard statements are an essential element under the GHS, and will eventually replace the risk phrases (R-phrases) described earlier in the paragraph. In addition to hazard statements, containers and Material Safety Data Sheets (MSDS) will often contain, where necessary, one or multiple pictograms, a signal word such as "Warning" or "Danger," and precautionary statements. The precautionary statements will indicate proper handling procedures aimed at protecting the user and other people who might come in contact with the substance during an accident or in the environment. The container and MSDS will also contain the name of the supplier, manufacturer, or importer. Each hazard statement contains a four-digit code, starting with the letter H (in the format Hxxx). Statements appear under various headings grouped together by code number. The purpose of the four-digit code is for reference only; however, following the code is exact *phrase* as it should appear on labels and MSDS. The collection of Risk and Safety phrases in this work my go beyond those found in some, more generalized Material Safety Data Sheets. It is also possible that some of the warnings are based on animal rather than human studies. These statements are usually preceded by the word "suspected" or "potential".
- Water hazard classifications from the German Federal Water Management Act on Water Hazard Classification, *Verwaltungsvorschrift Wassergefährdende Stoffe* (VwVwS). This law requires all chemical substances be evaluated for their detrimental impact on the physical, chemical, or biological characteristics of water. Substances can be classified as nonhazardous to water (*nwg, nicht wassergefährdende*) or assigned to one of three numeric water hazard classes, WGK-1: low hazard to waters (low polluting to water), WGK-2: hazard to waters (water pollutant), or WGK: 3 severe hazard to waters (severe pollutant). The English acronym for WGK is WHC (water hazard class). This work uses the German initial-acronym "WGK" so there is no confusion as to its source. Material Safety Data Sheets (MSDS) that use these water hazards also use the German acronym. If a value was not assigned or not found in the German database, an estimated has been provided using the format, "*WGK (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]*." These estimates are based on other sources, for example, the US DOT *List of Marine Pollutants (§172.101—Appendix B)*. *Warning*: These estimates are to be used only as a guide. In the case of limited information, it is the responsibility of the users of this work to recognize and address those limitations and to engage in additional research, including direct contact with chemical suppliers and all forms of supplier communications such as the legally required Material Safety Data Sheets (MSDSs), Technical Bulletins, etc.

Description: This section contains a quick summary of properties of the substance including physical state (solid, liquid or gas), color, odor description, molecular weight, density, boiling point, freezing/melting point, vapor

pressure, flash point, autoignition temperature, explosion limits in air, Hazard Identification (based on NFPA-704 M Rating System) in the format: Health (ranked 1 to 4), Flammability (ranked 1 to 4), Reactivity (ranked 1 to 4) (see also below for a detailed explanation of the System and Fire Diamond), and solubility or miscibility in water. This section may also contain special and relevant comments about the substance. Terms in this section are also defined in the glossary.

Odor threshold: This is the lowest concentration in air that most humans can detect by smell. Some value ranges are reported. The value cannot be relied on to prevent overexposure, because human sensitivity to odors varies over wide limits, some chemicals cannot be smelled at toxic concentrations, odors can be masked by other odors, and some compounds rapidly deaden the sense of smell.

Molecular weight: The MW as calculated from the molecular formula using standard elemental molecular weights (e.g. carbon = 12.1).

Boiling point at 1 atm: The value is the temperature of a liquid when its vapor pressure is 1 atm. For example, when water is heated to 100°C/212°F its vapor pressure rises to 1 atm and the liquid boils. The boiling point at 1 atm indicates whether a liquid will boil and become a gas at any particular temperature and sea-level atmospheric pressure.

Melting/Freezing point: The melting/freezing point is the temperature at which a solid changes to liquid or a liquid changes to a solid. For example, liquid water changes to solid ice at 0°C/32°F. Some liquids solidify very slowly even when cooled below their melting/freezing point. When liquids are not pure (e.g., salt water) their melting/freezing points are lowered slightly.

Flash point: This is defined as the lowest temperature at which vapors above a volatile combustible substance will ignite in air when exposed to a flame. Depending on the test method used, the values given may be either Tag Closed Cup (cc) (ASTM D56) or Cleveland Open Cup (oc) (ASTM D93). The values, along with those in *Flammable Limits in Air* and *Autoignition temperature* below, give an indication of the relative flammability of the chemical. In general, the open cup value is slightly higher (perhaps 10 to 15°F higher) than the closed cup value. The flash points of flammable gases are often far below 0° (F or C) and these values are of little practical value, so the term "flammable gas" is often used instead of the flash point value.

Autoignition Temperature: This is the minimum temperature at which the material will ignite without a spark or flame being present. Values given are only approximate and may change substantially with changes in geometry, gas, or vapor concentrations, presence of catalysts, or other factors.

Flammable Limits in Air: The percent concentration in air (by volume) is given for the LEL (lower explosive-flammable limit in air, % by volume) and UEL (upper explosive flammable limit in air, % by volume), at room temperature, unless other specified. The values, along with those in "Flash point" and "Autoignition temperature" give an indication of the relative flammability of the chemical.

NFPA Hazard Classifications: The NFPA 704 Hazard Ratings (Classifications) are based on those found in "*Fire Protection Guide to Hazardous Materials*," 2001 edition, National Fire Protection Association, Quincy, MA, ©1994. The classifications are defined in Table 1.

Table 1. *Explanation of NFPA Hazard Classifications*

Classification	*Definition*
HEALTH HAZARD (blue)	
4	Materials which on very short exposure could cause death or major residual injury (even though prompt medical treatment was given), including those that are too dangerous to be approached without specialized protective equipment
3	Materials which on short exposure could cause serious temporary or residual injury (even though prompt medical treatment was given), including those requiring protection from all bodily contact
2	Materials that, on intense or continued (but not chronic) exposure, could cause temporary incapacitation or possible residual injury, including those requiring the use of protective clothing that has an independent air supply
1	Materials which on exposure would cause irritation but only minor residual injury, including those requiring the use of an approved air-purifying respirator
0	Materials that, on exposure under fire conditions offer no hazard beyond that of ordinary combustible material
FLAMMABILITY (red)	
Classification number and Definition	
4	This degree includes flammable gases, pyrophoric liquids, and Class IA flammable liquids. Materials which will rapidly or completely vaporize at atmospheric pressure and normal ambient temperature, or which are readily dispersed in air and which will burn readily
3	Includes Class IB and IC flammable liquids and materials that can be easily ignited under almost all normal temperature conditions
2	Materials that must be moderately heated before ignition will occur and includes Class II and Class IIIA combustible liquids and solids and semisolids that readily give off ignitable vapors
1	Materials that must be preheated before ignition will occur, such as Class IIIB combustible liquids, and solids and semisolids whose flash point exceeds 200°F/93.4°C, as well as most ordinary combustible materials
0	Materials that will not burn

REACTIVITY (yellow)

4 Materials that, in themselves, are readily capable of detonation, explosive decomposition or explosive reaction at normal temperatures and pressures

3 Materials that, in themselves, are capable of detonation, or explosive reaction, but require a strong initiating source or heating under confinement. This includes materials that are sensitive to thermal and mechanical shock at elevated temperatures and pressures and materials that react explosively with water

2 Materials that are normally unstable and readily undergo violent chemical change, but are not capable of detonation. This includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures. This also includes materials that may react violently with water or that may form potentially explosive mixtures in water

1 Materials that are normally stable, but that may become unstable at elevated temperatures and pressures and materials that will react with water with some release of energy, but not violently

0 Materials that are normally stable, even under fire exposure conditions, and that do not react with water

OTHER (white)

₩ Materials which react so violently with water that a possible hazard results when they come in contact with water, as in a fire situation. Similar to Reactivity Classification 2. Oxy—Oxidizing material; any solid or liquid that readily yields oxygen or other oxidizing gas, or that readily reacts to oxidize combustible materials

It should be noted that OSHA and DOT have differing definitions for the term "flammable liquid" and "combustible liquid." DOT defines a flammable liquid as one which, under specified procedures, has a flash point of 140°F/60°C or less. A combustible liquid is defined as "having a flash point above 140°F/60°C and below 200°F/93°C." OSHA defines a combustible liquid as having a flash point above 100°F/37.7°C.

Detection: Only those materials having specific or specialized testing materials have this section. For example, the chemical Abrin or Ricin can be detected using BTA (BioThreat Alert) test strips.

History of the material: This section is reserved for those materials having a useful and interesting background. Some of these materials may be, for example, invasive botanicals that may be found in populated areas Dangerous to both people and pets, these invasive plants may have to be professionally removed to prevent both spreading and accidental poisonings.

Potential Exposure: A brief indication is given of the nature of exposure to each compound in the industrial environment. Where pertinent, some indications are given of background concentration and occurrence from other than industrial discharges such as water purification plants. Obviously in a work of this magnitude, this coverage must be very brief. It is of course recognized that nonoccupational exposures may be important as well.

Incompatibilities: Important, potentially hazardous incompatibilities of each substance are listed where available. Where a hazard with water exists, it is described. Reactivity with other materials are described including structural materials such as metal, wood, plastics, cement, and glass. The nature of the hazard, such as severe corrosion formation of a flammable gas, is described. This list is by no means complete or all inclusive. In some cases a very small quantity of material can act as a catalyst and produce violent reactions such as polymerization, disassociation and condensation. Some chemicals can undergo rapid polymerization to form sticky, resinous materials, with the liberation of much heat. The containers may explode. For these chemicals the conditions under which the reaction can occur are given.

Permissible Exposure Limits in Air: The permissible exposure limit (PEL), has been cited as the federal standard where one exists. Inasmuch as OSHA has made the decision to enforce only pre-1989 PELs, we decided to use these values rather than the transitional limits that were vacated by court order. Except where otherwise noted, the PELs are 8-hour work-shift time-weighted average (TWA) levels. Ceiling limits, Short-Term Exposure Limits (STEL), and TWAs that are averaged over other than full work-shifts are noted.

The Short-Term Exposure Limit (STEL) values are derived from NIOSH,[58] ACGIH,[1] and HSE[33] publications. This value is the maximal concentration to which workers can be exposed for a period up to 15 minutes continuously without suffering from: irritation; chronic or irreversible tissue change; or narcosis of sufficient degree to increase accident proneness, impair self-rescue, or materially reduce work efficiency, provided that no more than four excursions per day are permitted, with at least 60 minutes between exposure periods, and provided that the daily TWA also is not exceeded. The "Immediately Dangerous to Life or Health" (IDLH) concentration represents a maximum level from which one could escape within 30 minutes without any impairing symptoms or any irreversible health effects. However, the 30-minute period is meant to represent a MARGIN OF SAFETY and is NOT meant to imply that any person should stay in the work environments any longer than necessary. In fact, every effort should be made to exit immediately. The concentrations are reported in either parts per million (ppm) or milligrams per cubic meter (mg/m^3).

Most US specifications on permissible exposure limits in air have come from ACGIH[1] or NIOSH.[2] In the In

Germany the DFG has established Maximum Concentrations in the workplace.[3] This section also contains numerical values for allowable limits of various materials in ambient air[60] as assembled by the US EPA. Where available, this field contains legally enforceable airborne Permissible Exposure Limits (PELs) from OSHA. It also contains recommended airborne exposure limits from NIOSH, ACGIH, and international sources and special warnings when a chemical substance is a Special Health Hazard Substance. Each are described below. TLVs have not been developed as legal standards and the ACGIH does not advocate their use as such. The TLV is defined as the time-weighted average (TWA) concentration for a normal 8-hour work-day and a 40-hour work-week, to which nearly all workers may be repeatedly exposed, day after day, without adverse effects. A ceiling value (TLV-C) is the concentration that should not be exceeded during any part of the working exposure. If instantaneous monitoring is not feasible, then the TLV-C can be assessed by sampling over a 15-minute period except for those substances that may cause immediate irritation when exposures are short. As some people become ill after exposure to concentrations lower than the exposure limits, this value cannot be used to define exactly what is a "safe" or "dangerous" concentration. ACGIH threshold limit values (TLVs) are reprinted with permission of the American Conference of Governmental Industrial Hygienists, Inc., from the booklet entitled, *Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices*. This booklet is revised on an annual basis. No entry appears when the chemical is a mixture; it is possible to calculate the TLV for a mixture only when the TLV for each component of the mixture is known and the composition of the mixture by weight is also known. According to ACGIH, "Documentation of the Threshold Limit Values and Biological Exposure Indices, 7th Edition" is necessary to fully interpret and implement the TLVs.

OSHA Permissible Exposure Limits (PELs), are found in Tables Z-1, Z-2, and Z-3 of OSHA, "General Industry Air Contaminants Standard (29CFR1910.1000)" that were effective on July 1, 2001 and which are currently enforced by OSHA.

Unless otherwise noted, PELs are the Time-Weighted Average (TWA) concentrations that must not be exceeded during any 8-hour shift of a 40-hour work-week. An OSHA ceiling concentration must not be exceeded during any part of the work-day; if instantaneous monitoring is not feasible, the ceiling must be assessed as a 15-minute TWA exposure. In addition there are a number of substances from Table Z-2 that have PEL ceiling values that must not be exceeded except for a maximum peak over a specified period (e.g., a 5- minute maximum peak in any 2 hours).

NIOSH Recommended Exposure Limits (RELs) are Time-Weighted Average (TWA) concentrations for up to a 10-hour work day during a 40-hour work week. A ceiling REL should not be exceeded at any time. Exposure limits are usually expressed in units of parts per million (ppm), i.e., the parts of vapor (gas) per million parts of contaminated air by volume at 25°C/77°F and one atmosphere pressure. For a chemical that forms a fine mist or dust, the concentration is given in milligrams per cubic meter (mg/m^3).

Protective Action Criteria (PAC) is emergency exposure limits developed by the US Department of Energy (DOE) for more than 3400 chemicals in revision 29, published May 2016. These exposure limits can be used to estimate the consequences of the uncontrolled release of hazardous materials and to plan for emergency response. These PACs have been added to the 7th edition of Sittig because other well established exposure limits in air are available for an only a limited number of chemicals from other governmental and advisory sources. PAC values are given in parts per million (ppm) for volatile liquids and gases; in milligrams per cubic meter (mg/m^3) for solids, particulates, solids, and nonvolatile liquids. Chemicals for which Acute Emergency Guideline Levels (AEGLs) and Emergency Response Planning Guidelines (ERPGs) have their values displayed in *bolded* font.

PAC Definitions[SCAPA]:

There are subtle difference in the definitions of AEGLs, ERPGs, and TEELs and major differences in how they are developed and issued. Differences in their definitions include:

AEGLs pertain to the "general population, including susceptible individuals," but ERPGs and TEELs pertain to "nearly all individuals."

AEGLs are defined as the level "above which" certain health effects are expected, while ERPGs and TEELs are defined as the level "below which" certain health effects are *not* expected.

Acute Emergency Guideline Levels (AEGLs) are defined as follows:

- *AEGL-1*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic, nonsensory effects. However, these effects are not disabling and are transient and reversible upon cessation of exposure.
- *AEGL-2*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience irreversible or other serious, long-lasting, adverse health effects or an impaired ability to escape.
- *AEGL-3*: the airborne concentration (expressed as ppm or mg/m^3) of a substance above which it is predicted that the general population, including susceptible individuals, could experience life-threatening adverse health effects or death.

Emergency Response Planning Guidelines (ERPGs) are defined as follows:

- *ERPG-1*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to one hour without experiencing other than mild transient adverse health effects or perceiving a clearly defined objectionable odor.
- *ERPG-2*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms that could impair their abilities to take protective action.
- *ERPG-3*: the maximum concentration in air below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing life-threatening health effects.

Additional information on PAC values and links to other sources of information can be found on the webpage for the *Subcommittee for Consequence Assessment and Protective Action (SCAPA)*: http://orise.orau.gov/emi/scapa/teels.htm

The German MAK (DFG MAK) values are conceived and applied as 8-hour time-weighted average (TWA) values.[3]

Short-Term Exposure Limits (15-minute TWA): This field contains Short-Term Exposure Limits (STELs) from ACGIH, NIOSH and OSHA. The parts of vapor (gas per million parts of contaminated air) by volume at 25°C/77°F and one atmosphere pressure is given. The limits are given in milligrams per cubic meter (mg/m^3) for chemicals that can form a fine mist or dust. Unless otherwise specified, the STEL is a 15-minute TWA exposure that should not be exceeded at any time during the work-day.

Determination in Air: The citations to analytical methods are drawn from various sources, such as the *NIOSH Manual of Analytical Methods*.[18] In addition, methods have been cited in the latest US Department of Health and Human Services publications including the *"NIOSH Pocket Guide to Chemical Hazards"* August, 2006.

Permissible Concentrations in Water: The permissible concentrations in water are drawn from various sources also, including: The National Academy of Sciences/National Research Council, Safe Drinking Water Committee Board on Toxicology and Environmental Health Hazards, *Drinking Water and Health*, 1980.[16]

The priority toxic pollutant criteria published by US EPA 1980.[6]

The multimedia environmental goals for environmental assessment study conducted by EPA.[32] Values are cited from this source when not available from other sources.

The US EPA has come forth with a variety of allowable concentration levels:

For allowable concentrations in "California List" wastes.[38] The California List consists of liquid hazardous wastes containing certain metals, free cyanides, polychlorinated biphenyls (PCBs), corrosives with a pH of less than or equal to 2.0, and liquid and nonliquid hazardous wastes containing halogenated organic compounds (HOCs).

For regulatory levels in leachates from landfills.[37]

For concentrations of various materials in effluents from the organic chemicals and plastics and synthetic fiber industries.[51]

For contaminants in drinking water.[36]

For National Primary and Secondary Drinking Water Regulations.[62]

In the form of health advisories for 16 pesticides,[47] 25 organics,[48] and 7 inorganics.[49]

For primary drinking water standards starting with a priority list of 8 Volatile Organic Chemicals.[40]

State drinking water standards and guidelines [61] as assembled by the US EPA.

Determination in Water: The sources of information in this field have been primarily US EPA publications including the test procedures for priority pollutant analysis[25] and later modifications.[42]

Routes of Entry: The toxicologically important routes of entry of each substance are listed. In other words, the way in which the people or experimental animals were exposed to the chemical is listed, e.g. eye contact, skin contact, inhalation, intraperitoneal, intravenous. Many of these are taken from the *NIOSH Pocket Guide*,[2] but are drawn from other sources as well.

Harmful Effects and Symptoms: These are primarily drawn from NIOSH, EPA publications, and New Jersey and New York State fact sheets on individual chemicals, and are supplemented from information from the draft criteria documents for priority toxic pollutants[26] and from other sources. The other sources include the following:

EPA Chemical Hazard Information Profiles (CHIPS) cited under individual entries.

NIOSH Information Profiles cited under individual entries.

EPA Health and Environmental Effect Profiles cited under individual entries.

Particular attention has been paid to cancer as a "harmful effect" and special effort has been expended to include the latest data on carcinogenicity. See also "Regulatory Authority and Advisory Bodies" section.

Short-Term Exposure: These are brief descriptions of the effects observed in humans when the vapor (gas) is inhaled, when the liquid or solid is ingested (swallowed), and when the liquid or solid comes in contact with the eyes or skin. The term LD50 signifies that about 50% of the animals given the specified dose by mouth will die. Thus, for a Grade 4 chemical (below 50 mg/kg) the toxic dose for 50% of animals weighing 70 kg (150 lb) is $70 \times 50 = 3500$ mg = 3.5 g, or less than 1 teaspoonful; it might be as little as a few drops. For a Grade 1 chemical (5−15 g/kg), the LD50 would be between a pint and a quart for a 150-lb man. All LD50 values have been obtained using small laboratory animals such as rodents,

cats, and dogs. The substantial risks taken in using these values for estimating human toxicity are the same as those taken when new drugs are administered to humans for the first time.

Long-Term Exposure: Where there is evidence that the chemical can cause cancer, mutagenic effects, teratogenic effects, or a delayed injury to vital organs such as the liver or kidney, a description of the effect is given.

Points of Attack: This category is based, in part, on the "Target Organs" in the *NIOSH Pocket Guide*[2] but the title has been changed as many of the points of attack are not organs (blood, for example). This is human data unless otherwise noted.

Medical Surveillance: For each chemical, this information is drawn from many and various government publications and sources including, for example, CDC, NIOSH publications,[27] *New Jersey* or *New york State Fact Sheets*,[70] HSDB/Toxnet, etc. In many cases, statements may refer to known and suspected carcinogen, known or suspected mutagens, reproductive affecters, skin and/or respiratory sensitizers, etc.

First Aid: Guides and guidance to first aid found in this work should not be construed as authorization to emergency personnel to perform the procedures or activities indicated or implied. Care of persons exposed to toxic chemicals must be directed by a physician or other recognized professional or authority. Simple first aid procedures are listed for response to eye contact, skin contact, inhalation, and ingestion of the toxic substance as drawn to a large extent from the *NIOSH Pocket Guide*[2] but supplemented by information from recent commercially available volumes in the United States,[29] in the United Kingdom, and in Japan[24] as well as from state fact sheets. They deal with exposure to the vapor (gas), liquid, or solid and include inhalation, ingestion (swallowing) and contact with eyes or skin. The instruction "Do NOT induce vomiting" is given if an unusual hazard is associated with the chemical being sucked into the lungs (aspiration) while the patient is vomiting. "*Seek medical attention*" or "*Call a doctor*" is recommended in those cases where only competent medical personnel can treat the injury properly. In all cases of human exposure, seek medical assistance as soon as possible. In many cases, medical advice has been included for guidance only. Dosage information has been avoided because dosage recommendations constantly change. Emergency personnel are urged to check all manufacturers' information particularly before administering any drug with which they are not familiar or have not used for some period of time. Also, medications suggested to be administered by qualified medical personnel presume no immediate prior administration of the same, similar or complicating medications.

Personal Protective Methods: This information is drawn heavily from NIOSH publications[2][77] and supplemented by information from the United States,[29] the United Kingdom, and Japan.[24] There are indeed other "personal protective methods" which space limitations prohibit describing here in full. One of these involves limiting the quantities of carcinogens to which a worker is exposed in the laboratory. The items listed are those recommended by (1) NIOSH and/or OSHA, (2) manufacturers, either in technical bulletins or in material safety data sheets (MSDS), (3) the Chemical Manufacturers Association (CMA), or (4) the National Safety Council (NSC), for use by personnel while responding to fire or accidental discharge of the chemical. They are intended to protect the lungs, eyes, and skin.

Respirator Selection: The 7th edition, like its predecessors, presents respirator selection with a full text description. For each line a maximum use concentration (in ppm, mg/m^3, μg/m^3, fibers/m^3, or mppcf) condition (e.g., escape) followed by the NIOSH code and full text related to respirator recommendations. All recommended respirators of a given class, can be utilized at any concentration equal to or less than the class's listed maximum use concentration. Respirator selection should follow recommendations that provide the greatest degree of protection. Respirator codes found in the *NIOSH Pocket Guide* have been included to ease updating.

All respirators selected must be approved by NIOSH under the provisions of 42CFR84. The current listing of NIOSH/MSHA certified respirators can be found in the *NIOSH Certified Equipment List*, which is available on www.cdc.gov/niosh/npptl/topics/respirators/cel. This is the NIOSH Web site.

For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*. In the case of chemical warfare agents, use only SCBA Respirator certified by NIOSH For CBRN environments. CBRN stands for "Chemical, Biological, Radiological, and Nuclear."

Pesticides are not identified as such in the respirator selection tables. For those substances that are pesticides, the recommended air-purifying respirator must be specifically approved by NIOSH/MSHA. Specific information on choosing the appropriate respirator will be provided on pesticide labels. Approved respirators will carry a "TC" number prefix, which signifies they have been tested and certified for a specific level of protection. New respirators may carry a "TC-84A" prefix in compliance with 42 CFR 84 for testing and certifying nonpowered, air-purifying, particulate-filter respirators. The new Part 84 respirators have passed a more demanding certification test than the old respirators (e.g., dust and mist [DM], dust, fume and mist [DFM], spray paint, pesticide, etc.) certified under 30 CFR 11.

Additionally, a complete respirator protection program should be implemented including all requirements in 29CFR1910.134 and 42CFR84. At a minimum, a respirator protection program should include regular training, fit-testing, periodic environmental monitoring, maintenance inspection, and cleaning. The selection of the actual respirator to be used within the classes

of recommended respirators depends on the particular use situation, and should only be made by a knowledgeable person. Remember, air-purifying respirators will not protect from oxygen-deficient atmospheres. For firefighting, only self-contained breathing apparatuses with full facepieces operated in pressure-demand or other positive pressure modes are recommended for all chemicals in the *NIOSH Pocket Guide*.

Storage: The 7th edition now provides, as general guidance, a color-coded classification system similar to those often found in commerce and laboratories. It is the objective of any chemical storage classification system to prevent accidental combination of two or more incompatible materials that might be stored in the same space. To prevent an unwanted and possibly dangerous reaction, chemicals must be separated by space and/or physical barriers. Chemical storage areas should be appropriately labeled. Users must be careful to check the MSDS for both additional and specific information. Some chemical entries contain multiple storage codes because the chemical profile fits more than a single category.

Code	***Hazard***
Red	Flammables (Flash point $<100°F$)
Blue	Health hazards/toxics/poisons
Yellow	Reactives/oxidizers
White	Contact hazards
Green[a]	General storage

[a]For general storage, the colors gray and orange may also be used by some companies.

- Chemical containers that are not color coded should contain hazard information on the label.
- Check the MSDS to learn what personal protective equipment is required when using the substance
- *Red*: Flammability hazard: Store in a flammable (liquid or materials) storage area or approved cabinet away from ignition sources and corrosive and reactive materials.
- *Blue*: Health hazard/toxics/poisons: Store in a secure poison location.
- *Yellow*: Reactive hazard; store in a location separate from other materials, especially flammables and combustibles.
- *White*: Corrosive or contact hazard; store separately in a corrosion-resistant location.
- *Green (or gray or orange)*: General storage may be used. Generally, for flammability, health, and corrosivity with an NFPA rating of no higher than "2."
- Chemicals with labels that are colored and diagonally striped may react with other chemicals in the same hazard class. See MSDS for more information.
- *Red Stripe*: Flammability hazard: store separately from all other flammable materials. Example: sodium metal.
- *Yellow Stripe*: Reactivity hazard; store separately in an area isolated from flammables, combustibles, or other yellow coded materials. *Example*: reducing agents.
- *White stripe*: Contact hazard; not compatible with materials in solid white category. Store separately. *Exampl*e: Bases.

Other data in this field is drawn from, or based on, various resources, including the NFPA,[17] from Japanese sources[24] and from publications such as the *Hazardous Substance Fact Sheets* published by the New Jersey Department of Health and Senior Services.[70]

Shipping: The shipping guidance offered herein does not replace the training requirements of the DOT and in no way guarantees that you will be in full compliance with the DOT Regulations. *Labeling*: This section refers to the type label or placard required by regulation on any container or packaging of the subject compound being shipped. In some cases a material may require more than one hazardous materials label. *Quantity limitation*: This section lists quantities of material that may be shipped on passenger aircraft, rail, and cargo aircraft. Materials in certain hazard classes may be shipped under the small quantities exception (see 49 CFR 173.4) with specific approval from the Associate Administrator for Hazardous Materials Safety, DOT. *Hazard class or division*: This number refers to the division number or hazard class that must appear on shipping papers. This information is drawn from DOT publications[19] as well as UN publications[20] and also NFPA publications.[17] The US DOT[19] has published listings of chemical substances which give a hazard classification and required labels. The US DOT listing now corresponds with the UN listing[20] and specifies first a hazard class of chemicals as defined in the following table, and then a packing group (I, II, or III) within each of the classes. These groups are variously defined depending on the hazard class but in general define materials presenting: I—a very severe risk (great danger); II—a serious risk (medium danger); and III—a relatively low risk (minor danger).

Hazard Classification System

The hazard class of dangerous goods is indicated either by its class (or division) number or name. For a placard corresponding to the primary hazard class of a material, the hazard class or division number must be displayed in the lower corner of the placard. However, no hazard class or division number may be displayed on a placard representing the subsidiary hazard of a material. For other than Class 7 or the OXYGEN placard, text indicating a hazard (for example, "CORROSIVE") is not required. Text is shown only in the United States. The hazard class or division number must appear on the shipping document after each shipping name.

Class 1—Explosives
Division 1.1: Explosives with a mass explosion hazard
Division 1.2: Explosives with a projection hazard
Division 1.3: Explosives with predominantly a fire hazard
Division 1.4: Explosives with no significant blast hazard
Division 1.5: Very insensitive explosives with a mass explosion hazard
Division 1.6: Extremely insensitive articles
Class 2—Gases
Division 2.1: Flammable gases
Division 2.2: Nonflammable, nontoxic* gases
Division 2.3: Toxic* gases
Class 3—Flammable liquids [and combustible liquids (United States)]
Class 4—Flammable solids; spontaneously combustible materials; and dangerous when wet materials/Water-reactive substances
Division 4.1: Flammable solids
Division 4.2: Spontaneously combustible materials
Division 4.3: Water-reactive substances/dangerous when wet materials
Class 5—Oxidizing substances and organic peroxides
Division 5.1: Oxidizing substances
Division 5.2: Organic peroxides
Class 6—Toxic* substances and infectious substances
Division 6.1: Toxic* substances
Division 6.2: Infectious substances
Class 7—Radioactive materials
Class 8—Corrosive substances
Class 9—Miscellaneous hazardous materials/Products, Substances or Organisms

**Note*: The words "poison" or "poisonous" are synonymous with the word "toxic."

Spill Handling: Spill or leak information provided is intended to be used only as a guide. The term *Issue warning* is used when the chemical is a poison, has a high flammability, is a water contaminant, is an air contaminant (so as to be hazardous to life), is an oxidizing material, or is corrosive. *Restrict access* is used for those chemicals that are unusually and immediately hazardous to personnel unless they are protected properly by appropriate protective clothing, eye protection, and respiratory protection equipment, etc. *Evacuate area* is used primarily for unusually poisonous chemicals or these that ignite easily. *Mechanical containment* is used for water-insoluble chemicals that float and do not evaporate readily. *Should be removed* is used for chemicals that cannot be allowed to disperse because of potentially harmful effects on humans or on the ecological system in general. The term is not used unless there is a reasonable chance of preventing dispersal, after a discharge or leak, by chemical and physical treatment. *Chemical and physical treatment* is recommended for chemicals that can be removed by skimming, pumping, dredging, burning, neutralization, absorption, coagulation, or precipitation. The corrective response may also include the use of dispersing agents, sinking agents, and biological treatment. *Disperse and flush* is used for chemicals that can be made nonhazardous to humans by simple dilution with water. In a few cases the response is indicated even when the compound reacts with water because, when proper care is taken, dilution is still the most effective way of removing the primary hazard. This material safety data sheet information is drawn from a variety of sources including New Jersey Department of Health and Senior Services *Hazardous Substance Fact Sheets*[70] and EPA *Profiles on Extremely Hazardous Substances.*[82]

Fire Extinguishing: Fire information provided is intended to be used only as a guide. Certain extinguishing agents should not to be used because the listed agents react with the chemical and have the potential to create an additional hazard. In some cases they are listed because they are ineffective in putting out the fire. Many chemicals decompose or burn to give off toxic and irritating gases. Such gases may also be given off by chemicals that vaporize in the heat of a fire without either decomposing or burning. If no entry appears, the combustion products are thought to be similar to those formed by the burning of oil, gasoline, or alcohol; they include carbon monoxide (poisonous), carbon dioxide, and water vapor. The specific combustion products are usually not well known over the wide variety of conditions existing in fires; some may be hazardous. This information is drawn from NFPA publications,[17] FEMA,[78] and other sources. Any characteristic behavior that might increase significantly the hazard involved in a fire is described. The formation of flammable vapor clouds or dense smoke, the possibility of polymerization, and explosions is stated in this section and/or the incompatibility section. Unusual difficulty in extinguishing the fire is noted.

Disposal Method Suggested: The disposal methods for various chemical substances have been drawn from various sources, including government documents and a UN publication.[22,79]

References: The general bibliography for this volume follows immediately. It includes both general reference sources and references dealing with analytical methods. The references at the end of individual chemical records are generally restricted to: references dealing only with that particular compound; and references which, in turn, contain bibliographies giving references to the original literature on toxicological and other behavior of the substance in question.

Key to Abbreviations and Acronyms

α	the Greek letter *alpha*; used as a prefix to denote the carbon atom in a straight chain compound to which the principal group is attached.
***as*-**	prefix for asymmetric
ACGIH	American Conference of Governmental Industrial Hygienists
AEGL	Acute Emergency Guideline Level, developed by the EPA
AIHA	American Industrial Hygeine Association
approx	approximately
***asym*-**	prefix for asymmetric
@	at
atm.	atmosphere
ATSDR	Agency for Toxic Substances and Disease Registry
β	the Greek letter *beta*
BEI	Biological Exposure Indices (ACGIH in the USA; South Africa; New Zealand)
BLV	Biological Limit Values
BP	boiling point.
°C	degrees Centigrade
CAA	Clean Air Act
CAAA	Clean Air Act Amendments of 1990
CAMEO	Computer-Aided Management of Emergency Operations (NOAA)
carc.	carcinogen
CAS	Chemical Abstract Service
cc	cubic centimeter
cc	closed cup (Flash point)
CDC	U.S. Center for Disease Control
CEPA	Canadian Environmental Protection Act
CERCLA	Comprehensive Environmental Response, Compensation, And Liability Act
CFCs	chlorofluorocarbons
CFR	*Code of Federal Regulations*
***cis*-**	(Latin: on this side). Indicating one of two geometrical isomers in which certain atoms or groups are on the same side of a plane
CMA	Chemical Manufacturers Association
CPR	Cardiopulmonary Resuscitation
CWA	Clean Water Act
***cyclo*-**	(Greek, circle). Cyclic, ring structure; as cyclohexane
Δ or δ	Greek letter *delta*
DFG	Deutsche Forschungs-gemeinschaft
DOE	U.S. Department of Energy
DOT	U.S. Department of Transportation
DOT ID	Department of Transportation Identification Numbers
EEC or EC	European Economic Community
EEGL	Emergency Exposure Guidance Level
EHS	Extremely Hazardous Substances
EINECS	European Inventory of Existing Commercial Chemical Substances
ε	Greek letter epsilon
EPA (US)	Environmental Protection Agency
EPCRA	Emergency Planning and Community Right-to-Know Act
ESLI	End of Service Life Indicator
est.	estimate
EU	European Union
°F	degrees Fahrenheit
FDA	Food and Drug Administration
FEMA	Federal Emergency Management Agency
FR	*Federal Register* (United States)
γ	Greek letter *gamma*
GHS	Globally Harmonized System of Classification and Labeling of Chemicals
h	hour(s)
HCFC	hydrochlorofluorocarbons
HCS	Hazard Communication Standard
HSDB	Hazardous Substances Data Bank
IARC	International Agency for Research on Cancer
IATA	International Air Transport Association
IDLH	Immediately Dangerous to Life or Health
ILO	International Labor Office
IRIS	Integrated Risk Information System (EPA)
***iso*-**	(Greek, equal, alike). Usually denoting an isomer of a compound.
kg	kilogram(s)
l	liter(s)
lb	pound(s)
$\mathbf{LC_{50}}$	The concentration of a substance in air that kills 50% of the test population.
$\mathbf{LC_{Lo}}$	The lowest concentration of a substance in air that has been shown to cause death in a test population.
$\mathbf{LD_{50}}$	The dose of a substance administered by any route (other than inhalation) that causes death to 50% of the test population.
$\mathbf{LD_{LO}}$	The lowest dose of a substance administered by any route (other than inhalation)that has been shown to cause death in a test population.

LEL	Lower explosive (flammable) limit in air, % by volume at room temperature or other temperature as noted
LEPC	Local Emergency Planning Committees
LTEL	Long Term Exposure Limit (UK)
m-	an abbreviation for "*meta-*," a prefix used to distinguish between isomers or nearly related compounds
m^3	cubic meter
MACT	Maximum Achievable Control Technology (CAA)
MAK	airborne exposure limit "Maximale Arbeitsplatz-Konzentration" (maximum workplace concentration) from the Deutsche Forschungsgemeinschaft (DFG), German Research Foundation.
MCL	Maximum Contaminant Level (SDWA)
MCLG	Maximum Contaminant Level Goal (SDWA)
mg	milligram(s)
μ	micro
μg	microgram(s)
min	minute(s)
mmHg	millimeters of mercury (non-SI symbol for pressure) Also known as "torr."
mppcf	million particles per cubic foot
MSDS	Material Safety Data Sheets
n-	abbreviation for "normal," referring to the arrangement of carbon atoms in a chemical molecule prefix for normal
N-	Symbol used in some chemical names, indicating that the next section of the name refers to a chemical group attached to a nitrogen atom. The bond to the nitrogen atom
NCI	National Cancer Institute (USA)
NFPA	National Fire Protection Association (USA)
NIOSH	National Institute for Occupational Safety and Health (USA)
NLM	National Library of Medicine (USA)
NOAA	National Oceanic and Atmospheric Administration (USA)
NOAEL	No Observed Adverse Effect Level
NOS	not otherwise specified
NPRI	National Pollutant Release Inventory (Canada)
NTIS	National Technical Information Service (USA)
NTP	National Toxicology Program (USA)
o-	*ortho-*, a prefix used to distinguish between isomers or nearly related compounds.
OEL	Occupational Exposure Limit
ω	Greek letter *omega*
oc	open cup
OSHA	Occupational Safety and Health Administration (USA)
Oxy	Oxidizer or oxidizing agent
p-	an abbreviation for "*para-*," a prefix used to distinguish between isomers or nearly related compounds
PAC	Protective Action Criterion (U.S. DOE)
PBB	polybrominated biphenyl
PCB	polychlorinated biphenyl
PE	polyethylene
PEL	Permissible Exposure Limit (USA, Japan, Mexico)
PNOS	Particulates Not Otherwise Specified
POTW	Publicly Owned Treatments Works
PP	polypropylene
ppb	parts per billion
PPE	Personal Protective Equipment
ppm	parts per million
PQL	Practical Quantitation Limit (RCRA)
prim-	prefix for primary
REL	Recommended Exposure Limits (NIOSH)
RQ	Reportable Quantity
RTECS	Registry of Toxic Effects of Chemical Substances
RTK	Right-to-Know
SARA	Superfund Amendments and Reauthorization Act
s. carc	Suspected Carcinogen
SCAPA	Subcommittee on Consequence Assessment and Protective Actions (DOE)
SCBA	Self-Contained Breathing Apparatus
SDWA	Safe Drinking Water Act
sec-	prefix for secondary
SERC	State emergency response commissions
SMCL	Secondary Maximum Contaminant Levels (SDWA)
STEL	Short-Term Exposure Limit
sym-	abbreviation for "symmetrical," referring to a particular arrangement of elements within a chemical molecule
t-	prefix for tertiary
TC_{Lo}	The lowest concentration of a substance in air that has been shown to produce toxic effects in a test population.
TD_{Lo}	The lowest dose of a substance that has been shown to produce toxic effects in a test population
TEEL	Temporary Emergency Exposure Limit
TRK	Technical Guiding Concentrations (DFG) for workplace control of carcinogens

tert-	abbreviation for “tertiary,” referring to a particular arrangement of elements within a chemical molecule
TLV	Threshold Limit Value (ACGIH)
TQ	Threshold Quantity
trans-	(Latin: across). Indicating that one of two geometrical isomers in which certain atoms or groups are on opposite sides of a plane
TRI	Toxic Release Inventory
TSCA	Toxic Substances Control Act
TWA	Time-Weighted Average. Often shown as TWA - 8h (8 hours)
UEL	Upper Explosive (flammable) Limit in air, % by volume at room temperature or other temperature as noted
UN	United Nations
unsym-	prefix for asymmetric
USDA	United States Department of Agriculture
USCG	United States Coast Guard
VOCs	Volatile Organic Compounds
WEEL	Workplace Environmental Exposure Level (AIHA)
WHMIS	Workplace Hazardous Materials Information System (Canada)
>	symbol for “greater than”
<	symbol for “less than”
≤	symbol for “less than or equal to”
≥	symbol for “greater than or equal to”
°	degrees of temperature
%	percent

P

Pancreatin P:0050

Synonyms: Beef viokase; Diastase vera; Donnazyme; Entozyme; Ilozyme; Intrazyme; Pancreatic extract; Pancrex-V; Pankreon; Pankrotanon; Panteric; Stamyl; Viobin; Viokase; Zypanar

CAS Registry Number: 8049-47-6; 8057-43-0; 9002-16-8; 9046-39-3

HSDB Number: 1976

RTECS Number: RT9033000

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Primary irritant (w/o allergic reaction), Sensitization hazard (skin, respiratory).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn; Risk phrases: R22; R36/37/38; R42/43; R50/53; Safety phrases: S16; S22; S24; S26; S36/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Pancreatin is a yellowish to cream-colored, amorphous powder with a strong odor. Slightly soluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Sparingly soluble in water.

Potential Exposure: It is an enzyme found in the pancreas and is used in medicines and in treating leather and textiles.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alcohols.

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Pancreatin can affect you when breathed in. Exposure can cause an asthma-like lung reaction, with rapidly occurring symptoms of wheezing and shortness of breath. A second type of lung reaction, with fatigue, shortness of breath and possibly fever can occur hours after exposure. This can lead to scars in the lungs. Once allergy develops, even low exposures can trigger symptoms. Other proteolytic enzymes similar to pancreatin can cause severe eye irritation and irritate the tongue, mouth, and cause nose bleeds and skin sores.

Long-Term Exposure: Repeated breathing exposure may cause changes in lung function, even without symptoms. May cause skin allergy, with rash and itching. May cause asthma-like allergy. Can cause severe allergic lung reaction with chills, fever, chest tightness; cough and/or shortness of breath. Repeated attacks may lead to permanent lung scarring. Once allergy develops, even low exposures can trigger symptoms.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation for Up to 8 hours after breathing exposure is recommended, as symptoms may be delayed.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to pancreatin, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US)

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00015-6

or EN149 (Europe)-approved self-contained breathing apparatus (SCBA) with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Store under nitrogen blanket. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alcohol and acids.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid but may not easily ignite. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Paraformaldehyde P:0120

Formula: $(CH_2O)_x$; $C_3H_6O_4$

Synonyms: Aldacide; Flo-more; Formagene; Formaldehyde polymer; Granuform; Paraform; Paraform 3; Paraformaldehido (Spanish); Polyformaldehyde; Polymerized formaldehyde; Polyoxymethylene; Polyoxymethylene glycol; Triformol; Trioxymethylene

CAS Registry Number: 30525-89-4; 110-88-3 (1,3,5-trioxane)

HSDB Number: 4070

RTECS Number: RV0540000 (paraformaldehyde); YM1400000 (trioxane)

UN/NA & ERG Number: UN2213/133

EC Number: 203-812-5 [*Annex I Index No.:* 605-002-00-0] (1,3,5-trioxane)

Regulatory Authority and Advisory Information

Carcinogenicity: DFG Carcinogen Category 4, probably not carcinogenic to humans.

Hazard Alert: Highly flammable solid, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Sensitization hazard (skin, resp.).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

European/International Regulations (*110-88-3*): Hazard Symbol: F, Xi; Xn; Risk phrases: R11, R36/37/38; R43; R62; Safety phrases: S2; S21; S36/37; S41; S46; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Paraformaldehyde is a white crystalline solid. Irritating odor. The term “trioxane” applies specifically to this trimer $(CH_2O)_3$ but paraformaldehyde is applied both to trioxane and other low polymers or oligomers of formaldehyde. Specific gravity (H_2O:1) = 1.5 @ 15°C; Boiling point = 115°C (trioxane); Freezing/Melting point = 155°C [120−180°C (decomposition/paraformaldehyde)]; 64°C (trioxane); Flash points = 45°C (trioxane); 70°C (paraformaldehyde); Autoignition temperature = 300°C. Explosive limits: LEL = 3.6%; UEL: 28.7% (trioxane); LEL = 7.0%; UEL: 73.0% (paraformaldehyde). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1. Slightly soluble in water.

Potential Exposure: Paraformaldehyde is used in polyacetal resin manufacture; as a food additive; and as an odorless fuel.

Incompatibilities: Paraformaldehyde dust forms an explosive mixture with air. Decomposes on contact with oxidizers, strong acids; acid fumes; and bases; with elevated temperatures, forming formaldehyde. May explode when heated. May explode on impact if peroxide contamination develops. Mixtures with hydrogen peroxide or liquid oxygen are explosives sensitive to heat, shock, or contact with lead.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 2 milligram per cubic meter

PAC-2: 23 milligram per cubic meter

PAC-3: 47 milligram per cubic meter

No Protective Action Criteria (PAC) available for *trioxane*

The Netherlands: 2 ppm/3 milligram per cubic meter ceiling value[57]; Japan: 5 ppm TWA

DFG MAK: 0.37 milligram per cubic meter [skin]; Peak limitation: Excursion factor 2, 15 min, mean; 4 times per shift; interval 1 hour; Category I: substances for which local irritant effects determine the exposure limit value, also respiratory allergens; Carcinogenic: Category 4; Pregnancy: Group C.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the eyes, nose, throat, and skin. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. See also "Formaldehyde"; this chemical forms formaldehyde when heated.

Long-Term Exposure: Repeated or prolonged contact may cause skin and lung sensitization, resulting in allergies. Paraformaldehyde may cause mutations. Handle with extreme caution. May cause kidney damage. Testing has not been completed to determine the carcinogenicity of paraformaldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Lungs, kidneys, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. These may be normal if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin or respiratory allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to this chemical, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Paraformaldehyde must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); strong acids (such as hydrochloric, sulfuric, and nitric) and alkaline materials (such as potassium or sodium hydroxide), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where paraformaldehyde is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Protect containers from physical damage. Store in tightly closed containers in a cool, well-ventilated area away from areas of high humidity.

Shipping: UN2213 Paraformaldehyde, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep paraformaldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon and may include formaldehyde. This chemical is a flammable solid. Dust can form an explosive mixture with air. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBASCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Primary irritant (w/o allergic reaction).

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U182

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, Xi; Risk phrases: R11; R18; R36/37/38; Safety phrases: S2; S21; S29 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Paraldehyde is a colorless liquid. Pleasant, sweet odor. Molecular weight = 132.16; Specific gravity (H_2O:1) = 0.99 @ 20°C; Boiling point = 124°C; Freezing/Melting point = 13°C; Flash point = 36°C; Vapor pressure = 7.5 mmHg @ 17°C; Autoignition temperature = 237°C. Explosive Limits: LEL = 1.3%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Slightly soluble in water.

Potential Exposure: Paraldehyde is used primarily in medicine. It is used as a hypnotic agent, in delirium tremens; and in treatment of psychiatric states characterized by excitement when drugs must be given over a long period of time. It also is administered for intractable pain which does not respond to opiates and for basal and obstetrical anesthesia. It is effective against experimentally induced convulsions and has been used in emergency therapy of tetanus, eclampsia, status epilepticus; and poisoning by convulsant drugs. Since it is used primarily in medicine, the chance of accidental human exposure or environmental contamination is low. However, paraldehyde decomposes to acetaldehyde and acetic acid; these compounds have been found to be toxic. In this case, occupational exposure or environmental contamination is possible. Since paraldehyde is prepared from acetaldehyde by polymerization in the presence of an acid catalyst, there exists a potential for adverse effects, although none have been reported in the available literature. It is also used in the manufacture of organic compounds.

Incompatibilities: Vapor or liquid may form explosive mixture with air. Incompatible with strong oxidants, strong acids; alkalis, ammonia, amines, iodides, hydrocyanic acid. Violent reaction with liquid oxygen. Contact with acids form acetaldehyde. Attacks rubber and plastics.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 14 milligram per cubic meter

PAC-2: 150 milligram per cubic meter
PAC-3: 930 milligram per cubic meter
Russia[43] MAC, workplace air: 5.0 milligram per cubic meter.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Paraldehyde can affect you when breathed in and by passing through your skin. Contact can cause severe eye irritation or burns with possible permanent damage, and irritates the skin. Overexposure can cause poor coordination and make you sleepy. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: High or repeated exposure can damage the liver and kidneys. Can irritate the lungs; bronchitis may develop. Repeated exposure may cause fatigue, tremors, changes in speech; personality changes; and/or poor memory.

Points of Attack: Liver, kidneys, lungs, brain.

Medical Surveillance: Liver and kidney function tests. Examine for brain effects. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to paraldehyde, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code -Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Paraldehyde must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); liquid oxygen; alkalis and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where paraldehyde is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of paraldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of paraldehyde.

Shipping: UN1264 Paraldehyde, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire.

Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in added solvent. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Suspected of causing genetic defects, Combustible, Environmental hazard, Agricultural Chemical, Drug.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P041

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R23/24/25; R27/28; R33; R51/53, R62; Safety phrases: S1/2; S28; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Paraoxon is an odorless, reddish-yellow oil. Fruity odor. Molecular weight = 275.22; Boiling point = 170°C @ 1 mmHg; Freezing/Melting point = 189°C; Vapor pressure = 9×10^{-5} mmHg @ 25°C. Slightly soluble in water; solubility = 3640 mg/L @ 20°C.

Potential Exposure: An organophosphate insecticide. Has been used as a medication.

Incompatibilities: Keep away from alkaline materials and strong oxidizers. Contact with oxidizers can cause the release of toxic oxides of phosphorus. May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate. In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas.

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices. This chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can cause rapid organophosphate poisoning. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. LD_{50} = (oral-rat) 1.8 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. Repeated exposure may cause personality changes, including depression, anxiety, irritability. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system (CNS); cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count (CBC). Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Refer to the NIOSH Criteria Documents #78-174 and #76-147 on manufacturing, formulating, and working safely with pesticides.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*:

absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid, but does not readily ignite. Thermal decomposition products may include oxides of phosphorus, nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: EPA (*dichloride*): Possible Human Carcinogen. United States Environmental Protection Agency Gene-Tox Program, Positive: S *cerevisiae* gene conversion.

Hazard Alert: Exposure can be lethal, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

Banned or Severely Restricted (several countries) (UN)[13]

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg) (dichloride)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg) (dichloride)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*dichloride*): Hazard Symbol: T+, N; Risk phrases: R24/25; R26; R36/37/38; R48/25; R50/53; R62; R63; Safety phrases: S1/2; S22; S28; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Paraquat is a yellow solid with a faint, ammonia-like odor. Molecular weight = 186.26; Specific gravity (H_2O:1) = 1.25; Boiling point = decomposes; Freezing/Melting point = 298°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): (paraquat) Health 4, Flammability 0, Reactivity 0. Soluble in water. Paraquat dichloride is a quaternary ion which usually is used as the dichloride salt. Molecular weight = 257.18. Highly soluble in water.

Potential Exposure: Those engaged in manufacture, formulation and application of this herbicide. Classified for restricted use: limited to use by a certified applicator, or those under applicator's direct supervision.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides (hydrolysis), alkylarylsulfonate wetting agents. Corrosive to metals. Decomposes in presence of ultraviolet (UV) light. Decomposes in heat (see physical properties, above) and in the presence of UV light, producing nitrogen oxides, hydrogen chloride.

Permissible Exposure Limits in Air:

NIOSH IDLH = 1.0 milligram per cubic meter

OSHA PEL: 0.5 milligram per cubic meter TWA, respirable dust [Skin]; vacated 1989 OSHA PEL 0.1 milligram per cubic meter TWA, [Skin] is still enforced in some states (dichloride)

NIOSH REL: 0.1 milligram per cubic meter TWA, respirable fraction [Skin] (dichloride)

ACGIH TLV: 0.5 milligram per cubic meter TWA, respirable fraction [Skin]. Excursion Limit Recommendation: Excursions in worker exposure levels may exceed 3 times the TLV-TWA for no more than a total of 30 minutes during a workday, and under no circumstances should they exceed 5 times the TLV-TWA, provided that the TLV-TWA is not exceeded.

Protective Action Criteria (PAC) Ver. 29[138]

4685-14-7

PAC-1: 0.3 milligram per cubic meter
PAC-2: 4.4 milligram per cubic meter
PAC-3: 26 milligram per cubic meter

1910-42-5 (dichloride salt)

PAC-1: 0.15 milligram per cubic meter
PAC-2: 1.6 milligram per cubic meter
PAC-3: 9.6 milligram per cubic meter

2074-50-2 (methosulfate)

PAC-1: 0.014 milligram per cubic meter
PAC-2: 0.15 milligram per cubic meter
PAC-3: 20 milligram per cubic meter

Austria: MAK 0.1 milligram per cubic meter, [skin], 1999; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, KZG-W 0.2 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 0.08 milligram per cubic meter, respirable dust, 2000; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 milligram per cubic meter

Several states have set guidelines or standards for paraquat in ambient air[60] ranging from 0.33 μ/m^3 (New York) to 0.50 μ/m^3 (South Carolina) to 1.0 μ/m^3 (Florida) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5003, Paraquat.

Permissible Concentration in Water: A lifetime health advisory of 3.0 μg/L has been derived by EPA (See "References" (31); Below). In addition, the state of Maine[61] has set a guideline for paraquat in drinking water of 17.0 μg/L (100).

Determination in Water: Fish Tox = 2115.13304000 ppb (VERY LOW); Octanol-water coefficient: Log $K_{ow} = -4.2$.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Effects occur in two stages, immediate and delayed. Caution is advised. Exposure to paraquat may be fatal; there is no effective antidote. Signs and symptoms of acute exposure to paraquat may be severe and include nausea, vomiting, diarrhea, and abdominal pain. A burning sensation of the mouth and esophagus with possible ulceration may occur following ingestion. Eye exposure may result in corneal opacification (cloudiness). Dermatitis and nail atrophy may occur following dermal contact. Delayed effects include transient reversible liver injury, acute renal failure and progressive pulmonary fibrosis with associated dyspnea (shortness of breath) and pulmonary edema. Absorbed through the skin and can lead to symptoms as listed in the following paragraph. In addition, can cause fingernail discoloration and damage (which returns to normal when exposure stops), irritation, redness, swelling and burning. Exposure through ingestion may cause burning of the mouth and throat, nausea, vomiting, abdominal pain; diarrhea and damage to the kidneys, heart and liver. Lung damage, leading to death, may occur. One half ounce of a 20% solution has caused death. Ingestion can also cause lung hemorrhage and fibrosis. The substance may cause effects on the lungs, kidneys, liver, cardiovascular system and gastro intestinal tract, resulting in impaired functions, tissue lesions.

Long-Term Exposure: Repeated or prolonged contact with skin may cause damage and possible loss of the fingernails, and can lead to dry and cracking skin with blistering. Repeated or prolonged exposure to the aerosol can cause lung irritation, lung damage; bronchitis may develop. Can cause scarring of the lungs leading to breathlessness. Can damage the liver, kidneys and affect the heart. Human Tox = 3.15000 ppb Health Advisory (HIGH)

Points of Attack: Eyes, skin, respiratory system; heart, liver, kidneys, gastrointestinal tract.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; Liver Function tests; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); urine (chemical/metabolite); urinalysis (routine). Consider the points of attack in preplacement and periodic physical examinations. Kidney function tests. EKG. Chemical users should be cautioned about the use of alcohol which can increase liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water, or bentonite clay in water, or activated charcoal in water; and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Obtain authorization and/or further instructions from the local hospital for performance of other invasive procedures. Rush to a health care facility.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 1 milligram per cubic meter:* CcrOv95 (APF = 10) [Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100];* or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter);* or Sa (APF = 10) (any supplied-air respirator);* or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. This chemical is inactivated by inert clays and anionic surfactants. Store in tightly closed containers in a cool, well ventilated area away from oxidizers; alkylaryl-sulfonate wetting agents; light. Where possible, automatically pump material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2781 Bipyridilium pesticide, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Thermal decomposition products may include oxides of nitrogen and carbon. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. If water pollution occurs, notify appropriate authorities. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. This chemical is a combustible solid. Procedures for bipyridilium pesticides are as follows. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Paraquat is rapidly inactivated in soil. It is also inactivated by anionic surfactants. Therefore an effective and environmentally safe disposal method would be to mix the product with ordinary household detergent and bury the mixture in clay soil. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] [parathion (all formulations)—aerosols, dustable powder (DP), emulsifiable concentrate (EC), granules (GR) and wettable powders (WP)—of this substance are included, *except* capsule suspensions (CS)].

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R24; R27/28; R33; R48/25; R50/53; Safety phrases: S1/2; S28; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Parathion is a clear liquid when fresh; pale yellow to dark brown liquid with a garlic-like odor. Commercial formulations use carrier solvents that may change the physical properties shown. Molecular weight = 291.28; Specific gravity (H_2O:1) = 1.27; Boiling point = 375°C; 157−162°C @ 6 mmHg (for CW agent); Freezing/Melting point = 6.1°C; also listed @ 2.9°C for chemical warfare (CW) agent; Flash point = 195°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 24 mg/L.

Potential Exposure: A severely hazardous pesticide formulation. Those exposed include those engaged in manufacture, formulation and application of this broad spectrum insecticide. This material has also been used as a chemical warfare agent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials. Attacks some plastics, rubbers, and coatings. Rapidly hydrolyzed by alkalis.

Permissible Exposure Limits in Air:

NIOSH IDLH = 10 milligram per cubic meter

OSHA PEL: 0.1 milligram per cubic meter TWA [skin]

NIOSH REL: 0.05 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.05 milligram per cubic meter TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI; 0.05 mg[creatinine]/g in urine, end-of-shift.

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 0.15 milligram per cubic meter

PAC-2: **1.5**$_{\mathbf{A}}$ milligram per cubic meter

PAC-3: **2.0**$_{\mathbf{A}}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.1 milligram per cubic meter measured as the, inhalable fraction TWA; Peak Limitation Category II(8) [skin]; Pregnancy Risk Group D; BAT: 100 μg[*p*-nitrophenol]/L in urine after several shifts (sampling time)

Arab Republic of Egypt: TWA 0.1 milligram per cubic meter, [skin], 1993; Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Finland: TWA 0.1 milligram per cubic meter, short-term exposure limit 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Japan: 0.1 milligram per cubic meter, [skin], 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; the Phillipines: TWA 0.1 milligram per cubic meter, [skin], 1993; Russia: STEL 0.05 milligram per cubic meter, 1993; Thailand: TWA 0.11 milligram per cubic meter, 1993; Turkey: TWA 0.1 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.1 milligram per cubic meter, short-term exposure limit 0.3 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for parathion in ambient air [60] ranging from 0.238 μ/m^3 (Kansas) to 0.33 μ/m^3 (New York) to 0.5 μ/m^3 (South Carolina) to 1.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 1.87 μ/m^3 (Pennsylvania) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides; OSHA Analytical Method ID-62.

Permissible Concentration in Water: Russia set a MAC[35] in surface water of 3.0 μg/L and Mexico has set maximum permissible concentrations of 1.0 μg/L in coastal waters and 10.0 μg/L in estuaries. Several states have set guidelines for parathion in drinking water[61] ranging from 8.6 μg/L in Maine to 30.0 μg/L in California and Kansas.

Determination in Water: Fish Tox = 0.26514000 ppb MATC (EXTRA HIGH); Octanol -water coefficient: Log K_{ow} = > 3.2. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Parathion irritates the eyes, skin, and respiratory tract. A cholinesterase inhibitor. Acute exposure to parathion may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression; and respiratory paralysis. Psychosis may occur. This material is extremely toxic; the probable oral lethal dose is 5−50 mg/kg, or between 7 drops and 1 teaspoonful for a 150 lb person. As little as 1 drop can endanger life if splashed in the eye. Toxicity is highest by inhalation. People at special risk are those with a history of glaucoma, cardiovascular disease; hepatic disease; renal disease; or CNS abnormalities. Some additional details on short-term exposure to parathion are as follows: *Inhalation:* Occasional human exposures at concentrations of 0.1−0.8 milligram per cubic meter did not give rise to any symptoms. Occasional human exposure @ 1.5−2.0 milligram per cubic meter resulted in nausea and vomiting. Higher exposures can give rise to dizziness; blurred vision; wheezing, excessive salivation; and muscle and abdominal cramps. An estimated 10−20 mg (1/1500 ounce) may cause death. *Skin:* However, many human poisonings have occurred through extensive skin contact at unspecified levels. This is the greatest hazard for some workers. Symptoms of poisoning include nausea, vomiting, weakness, blurring of vision and muscle cramps. NIOSH lists the following symptoms of exposure: irritation of the eyes, skin, respiratory system; miosis; rhinorrhea (discharge of thin nasal mucous); headache; chest tightness; wheezing, laryngeal spasm; salivation, cyanosis, anorexia, nausea, vomiting, abdominal cramps; diarrhea; sweating; muscle fasiculation; weakness, paralysis; giddiness, confusion, ataxia; convulsions, coma; low blood pressure; cardiac irregular/irregularities.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 0.23100 ppb Health Advisory (EXTRA HIGH).

Points of Attack: Respiratory system; CNS; cardiovascular system, eyes, skin, blood cholinesterase.

Medical Surveillance: NIOSH lists the following tests: blood serum; cholinesterase: whole blood (chemical/metabolite); cholinesterase: blood plasma; cholinesterase: blood plasma, red blood cells/count; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), end-of-workweek. NIOSH recommends that medical surveillance, including preemployment and periodic examinations, shall be made available to workers who may be occupationally exposed to parathion. Biologic monitoring is also recommended as an additional safety measure. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All

protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use SCBA >0.14 milligram per cubic meter. NIOSH: *0.5 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 milligram per cubic meter:* CcrFOv100 (APF = 50) [Any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]or SCBAE (an y appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store where possible leakage from containers will not endanger the worker. Maintain regular inspection of containers for leakage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers and alkaline material. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3278 Organophosphorus compound, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required, Potential Inhalation Hazard (Special Provision 5).UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is not very combustible unless dissolved in a hydrocarbon carrier such as xylene or toluene. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. One manufacturer recommends the use of a detergent in a 5% trisodium phosphate solution for parathion disposal and cleanup problems. For parathion disposal in general, however, the recommended method is incineration (816°C, 0.5 second minimum for primary combustion; 1204°C, 1.0 second for secondary combustion) with adequate scrubbing and ash disposal facilities[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Paris green (copper acetoarsenite) is an odorless emerald green crystalline powder which decomposes upon heating. Molecular weight = 1013.78. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: This material, and organoarsenic compound, is used primarily as an insecticide; it may be used as a wood preservative and a pigment, particularly for ships and submarines; and also finds use as an anthelmintic.

Incompatibilities: Can react vigorously with oxidizers. Emits highly toxic arsenic fumes on contact with acid or acid fumes; and in elevated temperatures.

Permissible Exposure Limits in Air:

arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

Protective Action Criteria (PAC) Ver. 29[138]

paris green; cupric acetoarsenite

PAC-1: 3.4 milligram per cubic meter

PAC-2: 22 milligram per cubic meter

PAC-3: 130 milligram per cubic meter

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Phillipines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3; TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air:[60] 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07−0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

Determination in Air: Filter; Reagent: Ion chromatography/hydride atomic absorption: NIOSH IV [#5022, Arsenic, organo-](18).

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons. Federal Drinking Water Guidelines: EPA 10 μg/L; State Drinking Water Guidelines: Arizona 10 μg/L; Connecticut 10 μg/L. Toxic pollutant designated pursuant to section 307 (a) (1) of the Clean Water Act and is subject to effluent limitations (arsenic and inorganic and organic arsenic) [40 CFR 401.15 (7/1/1987)]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: *for arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry. See OSHA Analytical Method #ID-105 for arsenic.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: It may cause eye and respiratory tract irritation. Industrial exposure may cause dermatitis. This material is extremely toxic; the probable oral lethal dose for humans is 5−50 mg/kg, or between 7 drops and 1 teaspoonful for a 150 lb person. Some absorption may occur through the skin and by inhalation, but most poisonings result from ingestion. Symptoms usually appear ½ to 1 hour after ingestion, but may be delayed. Causes gastric disturbance, tremors, muscular cramps; and nervous collapse; which may lead to death. Symptoms of exposure also include a sweetish, metallic taste and garlicky odor; difficulty in swallowing; abdominal pain; vomiting and diarrhea; dehydration; rapid heart beat; dizziness and headache; and eventually coma; sometimes convulsions; and death.

Long-Term Exposure: May cause liver damage. Arsenic compounds may cause blood, kidneys, and nervous system damage, and skin abnormalities may develop. See also entries for "Arsenic" and "Copper."

Points of Attack: Liver, kidneys, blood, skin.

Medical Surveillance: Test for urine arsenic. Levels should not be greater than 100 micrograms per gram of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. Blood tests including CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), Dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018*, Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, *"Inorganic Arsenic."*

Respirator Selection: *Copper dusts and mists: 5 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *10 milligram per cubic meter:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 milligram per cubic meter:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *100 milligram per cubic meter:* SaF: Pd, Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Arsenic: At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with copper acetoarsenite all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area, away from strong bases; strong acids; and moisture.

Shipping: UN1585 Copper acetoarsenite, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. STN: 49 232 20. UN3465 Organoarsenic compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required

Spill Handling:

Organoarsenic compound, solid or liquid

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 500/60
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include Poisonous fumes are produced in fire, including arsenichydride and oxides of arsenic, copper and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R22; R51/53; R63; Safety phrases: S16; S26; S29/35; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters.

Description: Colorless to yellowish, flammable liquid. Aromatic odor. Molecular weight = 203.36; Specific gravity (H_2O:1) = 0.955 @ 30/4°C; Boiling point = 142°C @ 21 mmHg; Vapor pressure = 8.85×10^{-2} mm @ 20°C[161]; Flash point = 124°C (oc). Sparingly soluble in water; solubility = 92 mg/L @ 21°C.

Potential Exposure: Pebulate is a thiocarbamate herbicide used for pre-emergence control of germinating seeds of broadleaf and grassy weeds in sugar beets, tobacco, and tomatoes. There are no registered residential uses of pebulate

Incompatibilities: Thiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of thiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine.Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of thiocarbamates with aldehydes, nitrides, and hydrides. Thiocarbamates are incompatible with acids, peroxides, and acid halides.

Permissible Concentration in Water: Hazardous to aquatic organisms with long lasting effects. Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3.5$.Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Unlike carbamates the thiocarbamates are not cholinesterase inhibitors, but some of them may react with recently ingested alcohol or alcohol-containing products including wine, medications, and cold remedies such as cough-syrups. Low toxicity. Concentrated solutions are slightly corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Dermal contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid respiration, slow heart beat. Severe exposure may result in death. LD_{50} (oral, rat) = > 1000 mg/kg; LD_{50} (dermal, rat) = > 4000 mg/kg.

Long-Term Exposure: A cholinesterase inhibitor. A possible neurotoxicant.

Points of Attack: Respiratory system, CNS, cardiovascular system, skin, eyes

Medical Surveillance: Preliminary medical examination to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical examinations of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests if necessary[30]. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4−8 ounces of water. Do not induce vomiting. *Note to physician or authorized medical personnel*: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral-and Clay-Based; Dirt/Earth[101]. Wear protective eye protection, gloves and clothing to prevent any reasonable probability of dermal contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following requirements: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code-Blue: Health Hazard/Poison. Store in a dark, secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis (such as sodium hydroxide and sodium bcarbonate). Stable when stored in glass or polyethylene containers.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: For solids, isolate spill or leak area in all directions for at least 25 meters/75 feet. For liquids, isolate spill or leak area in all directions for at least 50 meters/150 feet. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog or regular alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *If tank, rail car or tank truck is involved in a fire*, isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. If allowed, incineration with effluent gas scrubbing (carbon dioxide may be released) is recommended[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Noncombustible containers should be crushed and buried under more than 40 cm of soil[30]. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Pelargonic Acid P:0184

Formula: $C_9H_{18}O_2$

Synonyms: Cirrasol-185A; Econosan; Emery 202 (mixture with *n*-octoic acid); Emfac-1202; Hexacid C-9; Nonanoic acid; *n*-Nonoic acid; *n*-Nonylic acid; 1-Octanecarboxylic acid; Pelargic acid; Pelargon; Scythe; West agro acid sanitizer

CAS Number: 112-05-0

HSDB Number: 5554 as nonanoic acid

RTECS Number: RA6650000

UN/NA & ERG Number: UN3265/153

EC Number: 203-931-2 [*Annex I Index No.*: 607-197-00-2]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Primary irritant (w/o allergic reaction), Agricultural chemical.

Hazardous to aquatic life or environment, with possible long lasting effects[194]. Harmful to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: C, Xi; Risk phrases: R34; R36/37/39; R41; R53; Safety phrases: S1/2; S25; S26: S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Colorless or yellowish, combustible, oily liquid. Faint odor. Molecular weight 158.27; Specific gravity (H_2O:1) = 0.9055 @ 20°C; Boiling point = 255°C; Freezing/Melting point = 12.4°C; Boiling point = 255.5°C; Vapor pressure = 1.65×10^{-3} mmHg @ 25°C; Flash point = > 125°C; Autoignition temperature = 400°C; Explosive limits: LEL = 0.9%; UEL = 5.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; solubility 250 mg/L @ 25°C.

Potential Exposure: Pelargonic acid, a naturally occurring fatty acid herbicide/fungicide. It is used to control the growth of weeds and as a blossom thinner for apple and pear trees. It is also used as a food additive; as an ingredient in solutions used to commercially peel fruits and vegetables; in the manufacture of lacquers, plastics and pharmaceuticals.

Incompatibilities: Heated vapors may form explosive mixture with air. May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with strong bases and silver compounds; mixture with some silver compounds may form explosive salts of silver oxalate.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 13 milligram per cubic meter

PAC-2: 140 milligram per cubic meter

PAC-3: 840 milligram per cubic meter

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation; ingestion; dermal contact

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. This material can cause irritation and chemical burns to the skin, eyes, and respiratory and digestive tracts. May cause permanent eye damage. Very harmful if swallowed. Repeated or prolonged dermal contact may cause dermatitis. Inhalation may cause lung edema, a medical emergency that can be delayed up to 72 hours. LD_{50} (oral, rat) = 15 g/kg; LD_{50} (dermal, rat) = > 5 g/kg.

Long-Term Exposure: Dermatitis; serious problems with the digestive tract and respiratory tracts.

Points of Attack: Skin, eyes, and respiratory tract

Medical Surveillance: Preliminary medical examination to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical examinations of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA >20 milligram per cubic meter. Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fitting.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition prducts include oxides of carbon. On small fire, use dry chemical powder, carbon dioxide or water spray.On a large fire: use water spray, fog or alcohol-resistant foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. Use water spray or fog; do not scatter material using straight water jet streams. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Contact a licensed disposal facility about surplus and non-recyclable solutions. Burn in a chemical incinerator equipped with an afterburner and scrubber. Extra care must be exercised as the material in an organic solvent is highly flammable. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Pendimethalin P:0188

Formula: $C_{13}H_{19}N_3O_4$

Synonyms: AC 92553; Accotab; Aniline, 3,4-dimethyl-2,6-dinitro-*N*-(1-ethylpropyl)-; Benzenamine, 3,4-dimethyl-2,6-dinitro-*N*-(1-ethylpropyl)-; Benzenamine, *N*-(1-ethylpropyl)-3,4-dimethyl-2,6-dinitro-; Bullet (pendimethalin + cyanazine); Caswell No. 454BB; 3,4-Dimethyl-2,6-dinitro-*N*-(1-ethylpropyl)aniline; 2,5-Dinitro-*N*-(1-ethylpropyl)-3,4-xylidine; *N*-(1-Ethylpropyl)-3,4-dimethyl-2,6-dinitrobenzenamine; *N*-(1-Ethylpropyl)-3,4-dimethyl-2,6-dinitroanaline; *N*-(1-Ethylpropyl)-2,6-dinitro-3,4-xylidine; Go-Go-San; Herbadox; Pay-off; Pendimethaline; Penoxalin; Penoxaline; *N*-(3-Pentyl)-3,4-dimethyl-2,6-dinitroaniline; Prowl; Sipaxol; Squadron (with imazaquin); Stomp; Tata Panida; Tendimethalin; Valor; Way-up; 3,4-Xylidine, 2,6-dinitro-*N*-(1-ethylpropyl)-

CAS Number: 40487-42-1

HSDB Number: 6721

RTECS Number: BX5470000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 254-938-2 [*Annex I Index No.:*609-402-00-X]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen

Hazard Alert: Combustible, Possible risk of forming tumors, Possible endocrine disruptor, Sensitization hazard, Environmental hazard.

EPA Acceptable Daily Intake (ADI): Oral Reference Dose (RfD) = 0.04 mg/kg/day

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi, N; Risk phrases: R33; R43; R50/53; Safety phrases: S2; S24; S29/35; S37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Yellow-orange crystalline solid. Mild nut-like odor. Commercial product is available as an emulsifiable concentrate. Molecular weight = 281.33; Specific gravity (H_2O:1) = 1.19 @ 25°C; Boiling point = (decomposes) 330°C; Freezing/Melting point = 55−58°C; Vapor pressure = 9.4×10^{-6} mmHg @ 25°C. Slightly soluble in water; solubility = 0.32 mg/L @ 20°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Pendimethalin is a selective pre-emergence and postemergence 2,6-dinitroaniline herbicide used on various agricultural and non-agricultural sites to control broadleaf weeds and grassy weeds in crops such as apricot, carrot, cherry, corn, cotton, fig, garbanzos, garlic, olive, onion, nectarine, peach, pear, pecan, plum, rice and prune, and noncrop areas. It is applied to soil preplant, pre-emergence, and postemergence with ground and aerial equipment.

Incompatibilities: Reacts with oxidizers, acids and alkaline materials. Contact with strong oxidizers may cause fire and explosions.

Permissible Concentration in Water: State Drinking Water Guidelines: Arizona 280 μg/L; Florida 280 μg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: Method: USGS-NWQL O-1126-95; Procedure: gas chromatography-mass spectrometry with select-ion monitoring; Matrix: natural water; Detection Limit: 0.018 μg/L. Octanol-water coefficient: Log $K_{ow} = > 5.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Absorbed through the unbroken skin. Inhalation, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Irritates and possibly burns the skin, eyes, and respiratory tract. Eye contact may cause irritation, burning sensation, burns, and visual damage; inflammation of the conjunctiva, corneal opacity and slight physiologic dilatation of the pupils. Dermal contact causes irritation and possible burns. Rapidly absorbed through the unbroken skin and can be fatal. Causes irritation of the mucous membrane and upper respiratory tract. May cause violent sneezing and coughing. May cause increased perspiration, elevated temperature, perspiration, breathing, and heart rate; headache, weakness, nausea, abdominal pain, vomiting. Systemic intoxication is cumulative and has been fatal. High levels of exposure may be fatal. Inhalation may cause damage to the circulatory system and heart resulating in possible death due to cardiac failure. May be fatal if swallowed. Causes gastrointestinal irritation with nausea, vomiting and diarrhea. Symptoms are similar to those of acute inhalation. May cause liver and kidney damage. LD_{50} (oral, rat) = 1050−3180 mg/kg; LD_{50} (dermal, rat) = > 2 g/kg. LD_{50} (oral, rat) = 1050−3180 mg/kg; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: may cause tumors. Thyroid toxin. This material is capable of bioaccumulating. May cause cancer. Skin sensitizer.

Points of Attack: Thyroid gland. Skin, kidneys, liver.

Medical Surveillance: Preliminary medical examination to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical examinations of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Evaluation of thyroid function. Consult a physician if poisoning is suspected or if redness, itching, or burning of the eyes or skin develop. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral-and Clay-Based; Expanded Polymeric[88]. Wear protective eye protection, gloves and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Yellow Stripe: Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. (2) Color code-Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong acids; strong bases and other incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. Heated vapors in confined spaces can explode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers can explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine if a discarded chemical is classified as a hazardous waste. See 40 CFR Parts 261.3 for United States Environmental Protection Agency guidelines for the classification determination. Additionally, in order to ensure complete and accurate classification, waste generators must consult state and local hazardous waste regulations. Organic pesticides, whether of botanical or synthetic origin, can be destroyed by incineration equipped with scrubbers to remove acid wastes.

UN/NA & ERG Number: (PIH) UN1380/135

EC Number: 243-194-4

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Extremely flammable, Pyrophoric (Spontaneously flammable if impure. Approx. 35°C when pure[136]), Water reactive, Strong reducing agent.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, F+, Xi; Risk phrases: R12; R14; R17; R18; R36/37/38; Safety phrases: S9; S14; S16; S26; S33; S36/37/39; S41; S45 (see Appendix 4)

Description: Pentaborane is a colorless, volatile liquid. Unpleasant, sweetish odor, like sour milk. The Odor Threshold is 0.8 ppm. Molecular weight = 63.14; Specific gravity (H_2O:1) = 0.61 @ 25°C; Boiling point = 60°C; Freezing/Melting point = −47°C; Vapor pressure = 171 mmHg @ 25°C; Flash point = 30°C; Autoignition temperature: about 35°C. Explosive limits: LEL = 0.42%; UEL: 98%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2₩. Reacts slowly with water, decomposing forming heat and boric acid.

Potential Exposure: Pentaborane is used in rocket propellants and in gasoline additives.

Incompatibilities: Pentaborane is an extremely reactive reducing agent. It can ignite spontaneously in contact with air and many other materials. Reactions with oxygen are often violently explosive. Reacts with ammonia to form a diammoniate. Reacts on contact with water, oxidizers, halogens, including halogenated hydrocarbons. May sel-heat and ignite *spontaneously* in moist air, decomposes @ 150°C. Hydrolyzes slowly with heat in water to form boric acid. Contact with solvents, such as ketones, ethers and esters form shock-sensitive compounds. Pentaborane is stable in hydrocarbon solvents, but forms shock sensitive solutions in most carbonyl containing solvents. Corrosive to natural rubber, some synthetic rubbers and to some lubricants. Avoid dimethyl sulfoxide, direct sunlight and sources of ignition[101].

Permissible Exposure Limits in Air:

NIOSH IDLH = 1 ppm

Conversion factor: 1 ppm = 2.58 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.005 ppm/0.01 milligram per cubic meter TWA

NIOSH REL: 0.005 ppm/0.01 milligram per cubic meter TWA; 0.015 ppm/0.03 milligram per cubic meter STEL

ACGIH TLV[1]: 0.005 ppm/0.013 milligram per cubic meter TWA; 0.015 ppm/0.039 milligram per cubic meter STEL

Protective Action Criteria (PAC)* Ver. 29[138]
PAC-1: 0.015 ppm
PAC-2: **0.14_A** ppm
PAC-3: **0.51_A** ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
DFG MAK: 0.005 ppm/0.013 milligram per cubic meter TWA; Peak Limitation Category II(2)
Arab Republic of Egypt: TWA 0.1 milligram per cubic meter, [skin], 1993; Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Finland: TWA 0.1 milligram per cubic meter, short-term exposure limit 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; Japan: 0.1 milligram per cubic meter, [skin], 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; the Phillipines: TWA 0.1 milligram per cubic meter, [skin], 1993; Russia: STEL 0.05 milligram per cubic meter, 1993; Thailand: TWA 0.11 milligram per cubic meter, 1993; Turkey: TWA 0.1 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.1 milligram per cubic meter, short-term exposure limit 0.3 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for pentaborane in ambient air[60] ranging from 0.16 μ/m^3 (Virginia) to 0.2 μ/m^3 (Connecticut) to 1.0−3.0 μ/m^3 (North Dakota) to 2.0 μ/m^3 (Nevada).

Determination in Air: No Analytical Method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Causes severe irritation to the respiratory tract. Pentaborane may affect the CNS; resulting in visual disturbances, poor judgment; behavioral changes; loss of recent memory; nausea, vomiting, drowsiness, and difficulty in focusing. Inhalation of higher concentrations, headache, dizziness, nervous excitation; muscular pain; muscle incoordination; cramps, tremors, convulsions, and coma may occur Death can occur by CNS poisoning.

Long-Term Exposure: Possibly neurotoxic. May have lasting effects.

Points of Attack: CNS; brain, eyes, skin.

Medical Surveillance: Preemployment and periodic physical examinations to determine the status of the workers' general health should be performed. These examinations should be concerned especially with any history of CNS disease, personality or behavioral changes; as well as liver, kidney or pulmonary disease of any significant nature. Chest X-ray, blood, liver, and renal function studies may be helpful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.05 ppm:* Sa (APF = 10) (any supplied-air respirator). *0.125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *0.25 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Make certain respirator has no exposed rubber gaskets.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code-Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials.

Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, halogens, water, halogenated hydrocarbons. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1380 Pentaborane, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material, 6.1-Poisonous materials. Inhalation Hazard Zone A.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Do not touch spilled material, stop leak if you can do it without risk. For spills, dike for later disposal and do not apply water unless directed to do so. Clean up only under supervision of an expert. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Avoid breathing vapors, and keep upwind. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 2.9/4.7
Night 5.5/8.9

Fire Extinguishing: Reacts violently with halogenated extinguishing agents. Ignites spontaneously in air (spontaneously flammable if impure). Approx. 35°C when pure[136]. Boron hydrides present considerable fire and explosion hazard. They undergo explosive reaction with most oxidizing agents, including halogenated hydrocarbons. Thermal decomposition products may include toxic fumes and can react vigorously with oxidizing materials. Fires tend to reignite. Thermal decomposition products may include hydrogen bromide. Ignites spontaneously in air. Reacts violently with halogenated extinguishing agents. Fires tend to reignite. If material is on fire or involved in fire, do not extinguish unless flow can be stopped. *Do not use water or halogenated extinguishing agents*. Extinguish *small fires* with dry chemical or carbon dioxide. For *large fires* withdraw and let burn. Move container from fire area if you can do it without risk. Cool containers that are exposed to flames with water from the side until well after fire is out. *For massive fire* in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Wear positive pressure breathing apparatus and full protective clothing. If fire becomes uncontrollable or container is exposed to direct flame-evacuate for a radius of 1500 feet. If material is leaking (not on fire), downwind evacuation must be considered. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full

facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with aqueous scrubbing of exhaust gases to remove B_2O_3 particulates.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg).

List of Stockholm Convention POPs: Annex A (Elimination); Annex C (Unintentional production and release).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Risk phrases: F, Xn, N; R11; R22; R50/53; Safety phrases: S2; S29/35; S41; S46; S50; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Pentachlorobenzene is a colorless crystalline solid. Pleasant aroma. Molecular weight = 250.34; Specific gravity (H_2O:1) = 1.8 @ 16°C; Boiling point = 277°C; Freezing/Melting point = 86°C; Vapor pressure = 6.5×10^{-3} mmHg @ 25°C;. Insoluble in water; solubility 0.65 mg/L.

Potential Exposure: Pentachlorobenzene is used primarily as a precursor in the synthesis of the fungicide pentachloronitrobenzene, and as a flame retardant. Drug/Therapeutic Agent; Fungicide; bactericide; wood preservative; industrial Insecticides.

Incompatibilities: Polychlorinated hydrocarbons Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, aluminum, liquid oxygen; potassium, sodium.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 4.4 milligram per cubic meter

PAC-2: 49 milligram per cubic meter

PAC-3: 220 milligram per cubic meter

Determination in Air: Filter/XAD-2; workup with hexane; GC/ECD; NIOSH Analytical Method (IV) #5517, Polychlorobenzenes.

Determination in Water: A persistent organic pollutant. Octanol-water coefficient: Log $K_{ow} = > 5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Permissible Concentration in Water: The United States Environmental Protection Agency has set a criterion of 0.5 μg/L based on toxicity studies.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May affect the nervous system. LD_{50} = (oral-rat) 1080 mg/kg.

Long-Term Exposure: Pentachlorobenzene may affect the liver and kidneys, causing tissue lesions. Limited animal studies have produced developmental effects and decreased body weights in fetuses.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: *Skin Contact:* [52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources[52]. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Pentachloroethane is a colorless, heavy, nonflammable liquid with a sweetish chloroform-or camphor-like odor. Molecular weight = 202.29; Specific gravity (H_2O:1) = 1.7 @ 20°C Boiling point = 162°C; Freezing/Melting point = −29°C; Vapor pressure = 7.5 mmHg @ 37°C; Flash point = 75°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Practically insoluble in water.

Potential Exposure: Pentachloroethane is used in the manufacture of tetrachloroethylene and as a solvent for cellulose acetate, certain cellulose ethers; resins, and gums. It is also used as a drying agent for timber by immersion at temperatures greater than 100°C.

Incompatibilities: Pentachloroethane is pyrophoric; may self-ignite, especially in moist air. Violent reaction with alkali metals (i.e., lithium, sodium, potassium, rubidium, cesium, francium); will produce spontaneous explosive chloroacetylenes. Shock-and friction-sensitive material formed by mixture with potassium. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, moisture of any form, alcohols, heat, ammonia, ketones, esters, halogenated hydrocarbons, ethers, trichloroethylene. Contact with potassium may explode after a short delay. Reaction with alkalis or metals will produce a violent reaction. It is incompatible with strong oxidizing agents.

Permissible Exposure Limits in Air:

NIOSH REL: Handle with caution; See *NIOSH Pocket Guide*, Appendix C

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 130 milligram per cubic meter

PAC-2: 730 milligram per cubic meter

PAC-3: 1200 milligram per cubic meter

DFG MAK: 5 ppm/42 milligram per cubic meter TWA; Peak Limitation Category II(2)

Rumania: TWA 30 milligram per cubic meter; Yugoslavia: MAC 5 ppm/40 milligram per cubic meter.

Determination in Air: Use NIOSH Analytical Method (IV) #2517.

Permissible Concentration in Water: Clean Water Act: Section 307(a)(1)Toxic Pollutants subject to effluent limitations as chlorinated ethanes.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Pentachloroethane is an irritant and a strong CNS depressant. Pentachloroethane has a strong narcotic effect. Symptoms include prompt nausea, vomiting, abdominal pain with diarrhea; headaches, dizziness, confusion, drowsiness, and occasionally, convulsions. Visual disturbances may arise followed by coma and possible death from respiratory arrest or circulatory collapse. Death may occur by respiratory arrest or circulatory collapse. Occasionally, sudden death may occur due to ventricular fibrillation. Other effects may include weight gain, edema, loss of appetite; jaundice, and pain (due to enlarged liver). The chemical is very toxic with a probable oral lethal dose of 50−500 mg/kg or between 1 teaspoon and 1 ounce for a 150 lb person. In animals: irritation of eyes, skin; weakness, restlessness, irregular/irregularities of respiration, muscle incoordination; liver, kidney, lung changes (NIOSH)

Long-Term Exposure: Exposure to this material may result in injury to the liver, lungs and kidneys.

Points of Attack: Eyes, skin, respiratory system; CNS; liver, kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator away from alkalis, reactive metals; water. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1669 Pentachloroethane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of boron and carbon,and flammable hydrogen. Fires should be extinguished using water, carbon dioxide; or dry chemical. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBA that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22].

Pentachloronaphthalene P:0220

Formula: $C_{10}H_3Cl_5$

Synonyms: Halowax 1013; Naphthalene, pentachloro-; 1,2,3,4,5-Pentachloronaphthalene

CAS Registry Number: 1321-64-8

HSDB Number: 2918

RTECS Number: QK0300000

EC Number: 215-320-8 [*Annex I Index No.:* 602-041-00-5]

Regulatory Authority and Advisory Information

United States Environmental Protection Agency GENETOX PROGRAM: Positive: Histidine reversion-Ames test, 1988.

Hazard Alert: Possible risk of forming tumors, Suspected reprotoxic hazard, Environmental hazard.

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N; Risk phrases: R21/22; R36/38; R50/53; R63; Safety phrases: S2; S29/35; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Pentachloronaphthalene is a pale yellow or white solid powder with an aromatic odor. Molecular weight = 300.38; Specific gravity (H_2O:1) = 1.67; Boiling point = 335.6°C. Freezing/Freezing/Melting point = 120°C; Vapor pressure = $<$ 1 mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Used in electric wire insulation, in additives to specialized lubricants; and as a fire-and water-proofing agent. No longer produced or used in the US.

Incompatibilities: Violent reaction with strong oxidizers, aluminum, liquid oxygen; potassium, sodium. Heat may contributes to instability.

Permissible Exposure Limits in Air:

OSHA PEL: 0.5 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA [skin]

Protective Action Criteria (PAC) not available

DFG MAK: 0.5 milligram per cubic meter TWA [skin]

Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter, [skin], 1999; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.5 milligram per cubic meter, [skin], 1999; France: VME 0.5 milligram per cubic meter, 1999; Norway: TWA 0.5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; Poland: MAC (TWA) 0.5 milligram per cubic meter, MAC (STEL) 1.5 milligram per cubic meter, 1999; Sweden: NGV 0.2 milligram per cubic meter, KTV 0.3 milligram per cubic meter, [skin], 1999; Switzerland: MAK-W 0.5 milligram per cubic meter, KZG-W 2.5 milligram per cubic meter, [skin], 1999; Turkey: TWA 0.5 milligram per cubic meter, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 milligram per cubic meter [skin]

When skin contact also occurs, you may be overexposed, even though air levels are less than the limit listed above.

Determination in Air: Use NIOSH II(2), Method #S9.

Determination in Water: Octanol-water coefficient: $\text{Log } K_{ow} = > 8$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin rash may occur if contaminated skin is exposed to sunlight. Can affect the nervous system; causing headache, fatigue, dizziness, vertigo (an illusion of movement); anorexia (loss of appetite).

Long-Term Exposure: Repeated or prolonged contact with skin may cause acne-like rash (chloracne), pruritus. May affect the liver, causing jaundice; liver necrosis

Points of Attack: Skin, liver, CNS.

Medical Surveillance: NIOSH lists the following tests: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator);* or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/ MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) (any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi, N; Risk phrases: R43; R50/53; R62; R63; Safety phrases: S2; S13; S24; S29/35; S37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Pentachloronitrobenzene forms colorless needles. Technical-grade PCNB contains an average of 97.8% PCNB, 1.8% hexachlorobenzene (HCB), 0.4% 2,3,4,5-tetrachloronitrobenzene (TCNB), and less than 0.1% pentachlorobenzene. Molecular weight = 295.34; Specific gravity (H_2O:1) = 1.72 @ 20°C; Boiling point = 328°C; Freezing/ Melting point = 144°C; Vapor pressure = 1×10^{-4} mbar @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Those engaged in manufacture, formulation and application of this soil fungicide and seed treatment chemical. Peracetic acid is often used as a sterilizing agent in the medical, food service and pharmaceutical industries in combination hydrogen peroxide and acetic acid.

Incompatibilities: Aromatic nitro compounds range from slight to strong oxidizing agents. If mixed with strong reducing agents, including hydrides, alkali metals; aluminum (powder); phosphorus; metal powder; sulfides and nitrides, contact may initiate vigorous reactions that culminates in a detonation. The aromatic nitro compounds may explode in the presence of a base such as sodium hydroxide or potassium hydroxide even in the presence of water or organic solvents[101].

Permissible Exposure Limits in Air:

ACGIH TLV[1]: 0.4 ppm STEL not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 28 milligram per cubic meter

PAC-3: 62 milligram per cubic meter

Denmark: TWA 0.5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; Russia[35,43] set a MAC in workplace air of 0.5 milligram per cubic meter and MAC values for ambient air in residential areas of 0.01 milligram per cubic meter on a momentary basis and 0.006 milligram per cubic meter on a daily average basis. A guideline in ambient air has been set[60] in Pennsylvania @ 2.47 μ/m^3.

Determination in Water: Fish Tox = 64.49856000 MATC (INTERMEDIATE)

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May cause skin andeye irritation; sensitization with erythema, itching and edema. A rebuttable presumption against registration of PCNB for pesticidal uses was issued on October 13, 1977 by EPA on the basis of oncogenicity. In varying degrees, organochlorines are absorbed from the gut and also by the lung and across the skin[72].

Long-Term Exposure: There is limited evidence that this compound is an animal carcinogen. Human Tox = 2.10000 ppb (HIGH).

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/ MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place away from strong bases. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN2811

Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Seal all wasters in vapor-tight plastic bags for eventual disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. It has been observed that the product decomposes readily when burned with polyethylene. The compound is highly stable in soil in general, as would be expected on the basis of the polychlorinated aromatic structure[22].

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R45; R24/25; R26; R36/37/38; R40; R50/53; R62; R63; Safety phrases: S1/2; S22; S29/35; S36/37; S45; S52; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Pentachlorophenol is a colorless to white, crystalline solid. It has a benzene-like odor; pungent when hot. The Odor Threshold in water is 1600 μg/L and the taste threshold in water is 30 μg/L. Molecular weight = 266.32; Specific gravity (H_2O:1) = 1.98; Boiling point = 308.9°C (decomposes); Freezing/Melting point = 190°C (anhydrous); Vapor pressure = 0.0001 mmHg @ 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility in water = 0.001@ 20°C.

Potential Exposure: Pentachlorophenol (PCP) is a commercially produced bactericide, fungicide, and slimicide used primarily for the preservation of wood, wood products; and other materials. As a chlorinated hydrocarbon, its biological properties have also resulted in its use as an herbicide, and molluscicide. Two groups can be expected to encounter the largest exposures. One involves the small number of employees involved in the manufacture of PCP. All of these are presently under industrial health surveillance programs. The second and larger group are the formulators and wood theaters. Exposure, hygiene and industrial health practices can be expected to vary from the small theaters to the larger companies. The principal use as a wood preservative results in both point source water contamination at manufacturing and wood preservation sites and, conceivably, nonpoint source water contamination through runoff wherever there are PCP-treated lumber products exposing PCP to soil

Incompatibilities: Reacts violently with strong oxidizers, acids, alkalies, and water.

Permissible Exposure Limits in Air:

NIOSH IDLH = 2.5 milligram per cubic meter

OSHA PEL: 0.5 milligram per cubic meter TWA[skin]

NIOSH REL: 0.5 milligram per cubic meter TWA[skin]

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA[skin]; BEI: 2 mg[total *PCP*]/g creatinine in urine/prior to last shift of workweek; 5 mg [free PCP]/L in plasma/end of Shift; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 1 milligram per cubic meter

PAC-2: 15 milligram per cubic meter

PAC-3: 150 milligram per cubic meter

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 0.5 milligram per cubic meter, [skin], 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 0.5 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.005 ppm (0.05 milligram per cubic meter), [skin], 1999; Finland: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, [skin], 1999; France: VME 0.5 milligram per cubic meter, [skin], continuous carcinogen, 1999; Hungary: TWA 0.2 milligram per cubic meter; STEL 0.4 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 0.06 milligram per cubic meter, [skin], 2003; Norway: TWA 0.05 ppm (0.5 milligram per cubic meter), 1999; Poland: MAC (TWA) 0.5 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Russia: STEL 0.1 milligram per cubic meter, [skin], 1993; Sweden: NGV 0.5 milligram per cubic meter, KTV 1.5 milligram per cubic meter, [skin], 1999; Switzerland: MAK-W 0.05 ppm (0.5 milligram per cubic meter); STEL 0.1 ppm, [skin], 1999; Turkey: TWA 0.5 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. The notation "skin" is added to indicate the possibility of cutaneous absorption. Russia[43] set a MAC in workplace air of 0.1 milligram per cubic meter and a MAC in ambient basis. Several states have set guidelines or standards for Pentachlorophenol in ambient air[60] ranging from zero (North Carolina) to 0.034 μ/m^3

(Massachusetts) to 1.67 μ/m^3 (New York) to 5.0 μ/m^3 (North Dakota and South Carolina) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut and South Dakota) to 12.0 μ/m^3 (Nevada and Pennsylvania) to 25.64 μ/m^3 (Kansas).

Determination in Air: Use NIOSH (IV) Analytical Method #5512, Pentachlorophenol; in blood, #8001; in urine, #8303; OSHA Analytical Method 39.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 5.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.001 mg/L; MCLG, zero. State Drinking Water Guidelines: Arizona 220 μg/L; Maine 3 μg/L; Minnesota 1 μg/L. Wisconsin 100 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Fish Tox = 23.89351000 MATC (INTERMEDIATE) ppb.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Pentachlorophenol can cause liver and kidney problems. An increased risk of cancer. Pentachlorophenol irritates the eyes, skin, and respiratory tract. May affect the cardiovascular system. *Inhalation:* Levels of 1 milligram per cubic meter can cause severe irritation of the nose, throat and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Breathing dust or particulates tainted with pentachlorophenol can give rise to sneezing. *Skin:* A 0.04% solution can cause pain and inflammation at point of contact. Chloracne, a skin disorder, has been observed in workers in pentachlorophenol manufacturing plants and wood preserving operations. Profuse sweating and elevated temperature are symptoms of poisoning due to prolonged contact. Excessive skin exposure has caused human death. *Eyes:* Levels of 1 milligram per cubic meter may be irritating and excessive contact can lead to loss of sight due to corneal damage. *Ingestion:* The lethal human dose is approximately equal to 1 teaspoon for a 150 lb person. Ingestion of 4−8 ounces followed by prompt emergency treatment still produced symptoms of poisoning which included rapid breathing followed by a decrease in breathing rate, abdominal pain; reduced blood pressure; excessive and slurred speech and weakness.

Long-Term Exposure: Irritation of eyes, throat, nose and upper lungs have been reported by individuals using pentachlorophenol as an insecticide for periods of a few years. Chemical acne has been associated with prolonged exposure to this compound. May affect the CNS; kidneys, liver, lungs. May be a carcinogen in humans. May damage the developing fetus. There is limited evidence that pentachlorophenol is a teratogen in animals. Tumors have been detected in experimental animals. Human Tox = 1.00000 ppb MCL (HIGH).

Points of Attack: Eyes, skin, respiratory system; cardiovascular system, liver, kidneys, CNS. Cancer site in animals: liver.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; urine (chemical/metabolite); urine (chemical/metabolite), end-of-workweek; urine (chemical/metabolite), prior-to-shift; urine (chemical/metabolite), prior-to-last-shift-of-workweek. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for pentachlorophenol. Liver and kidney function tests. Refer to the NIOSH Criteria Documents #78-174 and #76-147, *Manufacturing, formulating, and working safely with pesticides.*

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitrile, polyvinyl chloride, and Tychem (from E.I. du Pont de Nemours & Company) are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use SCBA > 1.4 milligram per cubic meter. NIOSH: *2.5 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter); or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) (any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Pentachlorophenol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3155 Pentachlorophenol, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire (The material itself does not burn). Thermal decomposition products may include hydrogen chloride, chlorinated phenol, chlorine, and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire-fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Incineration (600° to 900°C) coupled with acequate scrubbing and ash disposal facilities[22]. Alternatively pentachlorophenol in wastewaters, for example, may be recovered and recycled.

Pentaerythritol P:0250

Formula: $C_5H_{12}O_4$; $C(CH_2OH)_4$

Synonyms: 2,2-bis(Hydroxymethyl)-1,3-propanediol; Methane tetramethylol; Monopentaerythritol; PE; Pentaerythrite; Tetrahydroxymethylmethane; Tetramethylolmethane

CAS Registry Number: 115-77-5

HSDB Number: 872
RTECS Number: RZ2490000
UN/NA & ERG Number: UN1987 Alcohols, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid.
EC Number: 204-104-9
Regulatory Authority and Advisory Information
Hazard Alert: Combustible, Irritant (eye and upper resp.).
Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi; Risk phrases: R36/37; Safety phrases: S23; S24; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Pentaerythritol is a white crystalline solid. Odorless. Molecular weight = 136.17; Specific gravity (H_2O:1) = 1.38; Boiling point = (sublimes) 276°C @30 mmHg; Freezing/Melting point = (sublimes) 262°C; Vapor pressure = 8×10^{-8} mmHg @ 25°C. Flash point = ~150°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water; 6% @ 15°C.

Potential Exposure: Pentaerythritol is used in coatings and stabilizers; in the formation of alkyd resins and varnishes. It is used as an intermediate in the manufacture of plasticizers, explosives (PETN),and pharmaceuticals.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, organic acids, strong bases. Aquesous solution is acidic. Explosive compound is formed when a mixture of Pentaerythritol and thiophosphoryl chloride (CAS 3892-91-0) is heated.

Permissible Exposure Limits in Air:
OSHA PEL: 15 milligram per cubic meter (total inhalable dust) TWA; 5 milligram per cubic meter TWA, respirable fraction
NIOSH REL: 10 milligram per cubic meter (total inhalable dust) TWA; 5 milligram per cubic meter TWA, respirable fraction
ACGIH TLV[1]: 10 milligram per cubic meter TWA
Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 90 milligram per cubic meter
PAC-3: 540 milligram per cubic meter
Australia: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Finland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; United Kingdom: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, total inhalable dust; TWA 4 milligram per cubic meter, respirable dust, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter (total dust), 2003; the Netherlands: MAC-TGG 5 milligram per cubic meter (respirable dust), 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter. States which have set guidelines or standards for pentaerythritol in ambient air[60] include Virginia @ 80 μ/m^3 and Connecticut @ 300 μ/m^3.

Determination in Air: Use NIOSH IV Method #0500, total dust; Method #0600 (respirable dust), Particulates NOR.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes and respiratory system. Feeding studies using human volunteers showed that 85% of Pentaerythritol fed was eliminated unchanged in the urine within 30 hours. There are, in general, no significant effects on health by common routes of exposure even at abnormal use concentrations.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use dust respirator.

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from organic acids, oxidizers.

Shipping: UN1987 Alcohols, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Pentaerythritol Tetranitrate P:0255

Formula: $C_5H_8N_4O_{12}$; $C(CH_2ONO_2)_4$

Synonyms: Angicap; Angitet; Cardiacap; 1,3-Dinitrato-2,2-bis(nitratomethyl)propane; Nitropenta; Pentaerythrite tetranitrate; Pentaerithrityl tetranitrate; Pentaerithrityltetranitrat (German); Pentrita (Spanish); PETN; 1,3-Propanediol,2,2-bis[(nitrooxy) methyl]-, dinitrate (ester); Tetranitrato de pentaeritritilo (Spanish); Tétranitrate de pentaerithrityle (French); Vasitol; Vasodiatol

CAS Registry Number: 78-11-5; *(alt.)* 103842-90-6; *(alt.)* 108736-71-6

HSDB Number: 6313

RTECS Number: RZ2620000

UN/NA & ERG Number: UN0150 (Pentaerythrite tetranitrate, wetted or Pentaerythritol tetranitrate, wetted, or PETN, wetted or Pentaerythrite tetranitrate, or Pentaerythritol tetranitrate or PETN, desensitized)/112; UN3344 (Pentaerythrite tetranitrate mixture, desensitized, solid, n.o.s. with >10 % but not >20% PETN, by mass)/113

EC Number: 201-084-3 [*Annex I Index No.:* 603-035-00-5; 603-035-01-2]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade).; *Theft hazard* 400 (commercial grade).

Hazard Alert: Explosive (when dry), Unstable chemical, Strong Oxidizer, Possible risk of forming tumors, Suspected of causing genetic defects.

Chemicals Subject to TSCA 12(b) Export Notification Requirements, Section 4 (1%)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: E, O; Risk phrases: R1; R2; R3; R5; R8; R17; R62; Safety phrases: S1; S2; S35; S41 (see Appendix 4).

Description: Pentaerythrite tetranitrate (PETN) is a high explosive, especially when dry. PETN is a sand-like, white crystalline solid. Piratically odorless. Molecular weight = 316; Specific gravity (H_2O:1) = 1.8 @ 20°C; Boiling point = 205−215°C (explodes); Vapor pressure = negligible; 1.04×10^{-10} mmHg @ 25°C; 1.035×10^{-10} mmHg @ 25°C. Density 1.75−1.77 g/cm^3. Freezing/Melting point = 138−140°C. Autoignition temperature = (explodes) 210°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2; Flammability, 2; Reactivity, 4. Solubility in water = 4.3 mg/100 g @ 25°C. The principal hazard from PETN is blast from sudden and abrupt explosion; not from ruptured or bursting container fragments or rocketing projectiles.

Potential Exposure: First introduced following WWII, PETN shares the same chemical family as nitroglycerine. It is 70% more powerful than TNT. Used in the manufacture of fuses for detonation and explosive specialties, including the plastic explosive, Semtex, and in blasting caps. PETN is also used as a medical vasodilator to lower blood pressure by widening blood vessels to improve blood flow. PRTN has been used in terrorism attempts in 2001 by the so-called "shoe bomber," in 2009 by the "underwear bomber," and most recently in October 2010, hidden in printer cartridges being shipped internationally by passenger jet.

Incompatibilities: Treat PETN as an unstable explosive. Rapid heating can cause detonation when heated to 210°C. PETN is a dangerous high explosive and a strong oxidizer. PETN normally requires a blasting cap or other kind of detonator but may decompose explosively from concussion, shock, friction, static charges. Keep away from combustible materials; other oxidizers, for example, nitrates and permanganates. Contact with sulfur trioxide may cause detonation. Contact with reducing agents, e.g., zinc and alkaline metals may cause explosion. May explode in the presence of strong bases (i.e., sodium or potassium hydroxide). May react with heavy metals.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 5 milligram per cubic meter

PAC-2: 55 milligram per cubic meter

PAC-3: 330 milligram per cubic meter

If material is mixed with TNT, see entry T:0920.

Determination in Air: NIOSH method not established. If material is mixed with TNT, see entry T:0920.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.60$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of dust, fume, or vapor; ingestion of dust; percutaneous absorption from dust, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive and highly irritating. Target organs are the skin and heart. Contact irritates the eyes, nose and throat. Can penetrate the skin. Exposure can cause red eyes, dizziness, irritability, headache, convulsions, nausea, vomiting.

PETN is a vasodialator and can affect the cardiovascular system, resulting in widening of blood vessels and the lowering of blood pressure. Medical care is advised.

Long-Term Exposure: Lowest published toxic dose (oral, man): 1669 mg/kg/8 year-continuous. [British Journal of Dermatology (87,498,1972)].

Medical Surveillance: If material is mixed with TNT, see entry T:0920.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl chloride is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. The Webster skin test (colorimetric tests with alcoholic sodium hydroxide) or indicator soap should be used to make sure workers have washed all PETN off their skins.

Respirator Selection: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100].; or Any air-purifying full facepiece respirator equipped with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or Any supplied-air respirator with a full facepiece that is operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. An explosive and a strong oxidizer. Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Store in a explosion-proof refrigerator and keep away from reducing agents[52]. Store in a cool, dark place in a airtight container, separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Unless specified by manufacturer, store between 15 and 30°C. Protect from light. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Keep material wet with water and treat as an explosive. Keep away from heat, sources of ignition; metal, nitric acid; and reducing materials. Protect containers from shock. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3344 Pentaerythrite tetranitrate mixture, desensitized, solid, n.o.s. with >10% but not >20% PETN, by mass, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN0150 Pentaerythrite tetranitrate, wetted or Pentaerythritol tetranitrate, wetted, or PETN, wetted or Pentaerythrite tetranitrate, or Pentaerythritol tetranitrate or PETN, desensitized, Hazard Class: 1D; Labels:1D-Explosive (with a mass explosion hazard); D-Substances or articles which may mass detonate (with blast and/or fragment hazard) when exposed to fire.

Spill Handling: Seek expert help or contact manufacturer. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid dust. Do not wash material to sewer. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Collect waste material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Seek expert help or contact manufacturer. This chemical is a dangerously explosive solid and a strong oxidizer. It will increase the activity of an existing fire. The major hazard from PETN is the blast from sudden and abrupt explosion; not necessarily from ruptured or bursting container fragments or rocketing projectiles. Thermal decomposition products incluse oxides of nitrogen and carbon. If material is on fire and conditions permit, do not extinguish. Evacuate area and let burn. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material.If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Seek expert help with this explosive material. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. governing storage, transportation, treatment, and waste disposal.

HSDB Number: 109

RTECS Number: RZ9450000

UN/NA & ERG Number: UN1265/128

EC Number: 203-692-4 [*Annex I Index No.:* 601-006-00-1]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Highly flammable, Environmental hazard.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, Xn, N; Risk phrases: R12; R51/53; R65; R66; R67; Safety phrases: S1; S2; S9; S16; S29; S33; S35; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Pentane is a colorless liquid. Gas above 36°C. Gasoline-like odor. Molecular weight = 72.2; Specific gravity (H_2O:1) = 0.63; Boiling point = 36°C; Freezing/Melting point = −130°C; Vapor pressure = 420 mmHg @ 25°C; 400 mmHg @ 18.5°C; Flash point = −49.4°C (cc); Autoignition temperature = 260°C; also listed @ 284 and 309°C. Explosive limits: LEL = 1.4%; UEL: 7.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water.

Potential Exposure: Pentane is used in manufacture of ice, low-temperature thermometers; in solvent extraction processes; as a blowing agent in plastics; as a fuel; as a chemical intermediate (for amylchlorides, e.g.).

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some plastics, rubbers, and coatings.

Permissible Exposure Limits in Air:

NIOSH IDLH = 1500 ppm [LEL]

Conversion factor: 1 ppm = 2.95 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1000 ppm/2950 milligram per cubic meter TWA

NIOSH REL: 120 ppm/350 milligram per cubic meter TWA; 610 ppm/1,800 milligram per cubic meter [15 min.] Ceiling Concentration

ACGIH TLV[1]: 600 ppm/1770 TWA

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 3000 ppm

PAC-2: 33,000 ppm

PAC-3: 2.00E + 05 ppm

DFG MAK: 1000 ppm/3000 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C

Australia: TWA 600 ppm (1800 milligram per cubic meter); STEL 750 ppm, 1993; Austria: MAK 600 ppm (1899 milligram per cubic meter), 1999; Belgium: TWA 600 ppm (1770 milligram per cubic meter); STEL 750 ppm (2210 milligram per cubic meter), 1993; Denmark: TWA 500 ppm (1500 milligram per cubic meter), 1999; Finland: TWA 500 ppm (1500 milligram per cubic meter); STEL 625 ppm (1800 milligram per cubic meter), 1999; France: VME 600 ppm (1800 milligram per cubic meter), 1999; Hungary: TWA 500 milligram per cubic meter; STEL 1500 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 1800 milligram per cubic meter, 2003; the Phillipines: TWA 1000 ppm (2950 milligram per cubic meter), 1993; Poland: MAC (TWA) 1800 milligram per cubic meter; MAC (STEL) 2300 milligram per cubic meter, 1999; Russia: TWA 300 ppm; STEL 300 milligram per cubic meter, 1993; Sweden: NGV 600 ppm (1800 milligram per cubic meter), KTV 750 ppm (2000 milligram per cubic meter), 1999; Switzerland: MAK-W 600 ppm (1800 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (2950 milligram per cubic meter), 1993; United Kingdom: LTEL 600 ppm (1800 milligram per cubic meter); STEL 750 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 600 ppm. Russia[43] set a MAC in ambient air in residential areas of 100 milligram per cubic meter on a momentary basis and 25 milligram per cubic meter on an average daily basis. Several states have set guidelines or standards for pentane in ambient air[60] ranging from 7.0 milligram per cubic meter (Connecticut) to 18.0−22.5 milligram per cubic meter (North Dakota) to 30.0 milligram per cubic meter (Virginia) to 42.857 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #1500, Hydrocarbons, BP 36-126°C; #2549, Volatile organic compounds[18].

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Pentane can affect you when breathed in. Exposure can cause lightheadedness and dizziness and may cause you to pass out. It may damage the nervous system; causing numbness, “pins and needles,” and weakness in the arms and legs. Skin contact may cause rash and a burning sensation.

Long-Term Exposure: Repeated or prolonged contact can cause dry, cracked skin.

Points of Attack: Eyes, skin, respiratory system; and CNS.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system. Nerve conduction studies should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1200 ppm:* Sa (APF = 10) (any supplied-air respirator). *1500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Pentane must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where pentane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of pentane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of pentane.

Shipping: UN1265 Pentanes Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

European/International Regulations (*23-54-6*): Hazard Symbol: F+, Xn; Risk phrases: R11; R22; R62; R63; Safety phrases: S2; S21; S23; S24/25; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2,4-Pentanedione is a colorless to yellowish liquid with a sour, rancid odor. The Odor Threshold is 0.01 ppm. Molecular weight = 100; Specific gravity (H_2O:1) = 0.97 @ 20°C; Boiling point = 139°C; Freezing/Melting point = −23°C; Flash point = 34°C; Autoignition temperature = 340°C. Explosive limits: LEL = 2.4%; UEL: 11.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Acetoacetic acid derivative. 2,4-Pentanedione is used in gasoline and lubricant additives, fungicides, insecticides, and colors manufacture; as a chemical intermediate and in the manufacture of metal chelates.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. reducing agents; halogens, aliphatic amines; alkanolamines, organic acids; isocyanates. Strong light may cause polymerization.

Permissible Exposure Limits in Air:

ACGIH TLV[1]: 25 ppm TWA [skin]

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 75 ppm

PAC-2: 110 ppm

PAC-3: 200 ppm
DFG MAK: 20 ppm/83 milligram per cubic meter TWA; skin absorption, Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye irritation may be severe. May affect the nervous system. If inhaled, will cause dizziness, coughing, headaches, convulsions, loss of consciousness and possible death. In addition, to neuropathy, 2,4-pentanedione causes thymic atrophy; it complexes with and inhibits the activities of oxidizing enzymes; it causes minor to severe eye injury and minor to moderate skin irritation in animals; and it has caused contact urticaria and allergic contact dermatitis in humans.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. High exposure may affect the brain. May affect the lungs, thymus, CNS. There is limited evidence of reproductive damage and mutations.

Points of Attack: Skin, brain, lungs, CNS; thymus, lungs.

Medical Surveillance: Evaluation by a qualified allergist. Evaluation of brain effects. Thymus function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in stainless steel containers away from oxidizers, reducing agents; bases. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2310 Pentane-2,4-dione, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Hazard Alert: Extremely flammable, Possible polymerization hazard (heat), Environmental hazard.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, T, N, Xi, Xn; Risk phrases: R5; R12; R36/37/38; R39/25; R51; R52/53; Safety phrases: S1; S7; S16; S26; S29; S36/37; S45; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Pentene is a colorless liquid. Molecular weight = 70.1; Specific gravity (H_2O:1) = 0.64 @ 20°C; Boiling point = 30°C; Freezing/Melting point = −165°C; Vapor pressure = 70.81 kPa @ 20°C; Flash point = −18°C; Autoignition temperature = 276°C. Explosive limits: LEL = 1.5%; 24,000 ppm[138]; UEL: 8.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 1.

Potential Exposure: Workers in petroleum refineries and petrochemical plants.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Excessive heat may cause polymerization. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, heat. Incompatible with strong reducing agents such as hydrides; oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 120 ppm

PAC-2: 1300 ppm

PAC-3: 7700 ppm [> = 10% LEL, lower explosive limit but <50% LEL]

Russia[43] set a MAC for amylene in ambient air of residential areas @ 1.5 milligram per cubic meter both on a momentary and a daily average basis.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.8$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Simple asphyxiant. Narcotic in high concentrations. May affect CNS. Moderately toxic by oral and inhalation routes.

Long-Term Exposure: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

Points of Attack: Skin, eyes, respiratory tract, and nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Use protective gloves and safety goggles. Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/

clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1108 1-Pentene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. EC Number: 201-186-8 [*Annex I Index No.:* 607-094-00-8]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Flammable, Possible risk of forming tumors, Primary irritant (w/o allergic reaction), Environmental hazard, Highly Reactive Substance and Explosive[15].

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, O, C, N; Risk phrases: R3; R5; R7, R10; R12; R20/21/22; R23/24/25; R34; R35; R51; Safety phrases: S1/2; S3/7; S14; S23; S26; S27; S29; S36/37/39; R45; R60; R61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Peracetic acid is a colorless liquid. Transported and stored in diluted solution with acetic acid and hydrogen peroxide to prevent explosion. Molecular weight = 76.06; Specific gravity (H_2O:1) = 1.2; Boiling point = 105°C (violent decomposition @ 110°C); Freezing/Melting point = 0.1°C; Flash point = 41.3°C (oc); 56°C (32% in dilute acetic acid and <6% hydrogen peroxide); Autoignition temperature = 198°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2 (Oxidizer). Soluble in water.

Incompatibilities: This material is a powerful oxidizer. Thermally unstable, it decomposes violently @ 110°C. Concentrated material is shock-and friction-sensitive. May explode if concentration exceeds 56% of carrier, due to evaporation. Isolate from other stored material, particularly accelerators, oxidizers, organic or combustible materials, olefins, hydrogen peroxide, acetic anhydride, reducing substances. Keep away from acids, alkalies, heavy metals, organic materials

Potential Exposure: This compound is used as polymerization initiator, curing agent; and cross-linking agent; as bactericide and fungicide, especially in food processing; a reagent in making caprolactam and glycerol; an oxidant for preparing epoxy compounds; a bleaching agent; a sterilizing agent; and a polymerization catalyst for polyester resins.

Incompatibilities: This material is a powerful oxidizer. Thermally unstable, it decomposes violently @ 110°C. Concentrated material is shock-and friction-sensitive. May explode if concentration exceeds 56% of carrier, due to evaporation. Isolate from other stored material, particularly accelerators, oxidizers, organic or combustible materials; olefins, hydrogen peroxide, acetic anhydride, reducing substances. Keep away from acids, alkalis, heavy metals; organic materials.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{0.52}_{\mathbf{A}}$ milligram per cubic meter

PAC-2: $\mathbf{1.6}_{\mathbf{A}}$ milligram per cubic meter

PAC-3: $\mathbf{15}_{\mathbf{A}}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: Carcinogen Category 3B; See section X(a)

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Eye contact can cause severe irritation and burns; may cause permanent damage. Irritates the respiratory tract. Contact may burn the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Signs and symptoms of acute ingestion of peracetic acid may include corrosion of mucous membranes of mouth, throat, and esophagus with immediate pain and dysphagia (difficulty in swallowing); ingestion may cause gastrointestinal tract irritation. This is a very toxic compound. The probable human oral lethal dose is 50−500 mg/kg, or between 1 teaspoon and 1 ounce for a 150 lb persons.

Long-Term Exposure: There is limited evidence that peracetic acid causes cancer in animals. It may cause cancer of the lungs. High or repeated exposure may affect the liver and kidneys.

Points of Attack: Liver, kidneys, lungs.

Medical Surveillance: Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber and Viton are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Keep in a cool, well-ventilated area, separated from organic and combustible materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3107 Organic peroxide type E, liquid, Hazard Class: 5.2; Labels: 5.2-Organic peroxide, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid breathing vapors. Do not touch the spilled material; shut off all ignition sources and stop the leak if this can be done without risk. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Do not use spark-generating metals or organic materials for sweeping up or handling spilled material. Dispose of the absorbed peroxyacetic acid solution, in small quantities at a time, by placing it on the ground in a remote outdoor area and igniting with a long torch. Empty containers should be washed with a 10% sodium hydroxide solution. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid and a powerful oxidizer that can increase the activity of an existing fire. It explodes @ 230°F/110°C and is shock-sensitive, particularly if organic solvents are used in place of acetic acid as a carrier. Thermal decomposition products may include oxides of carbon. Fight fires from an explosion-resistant location. In advanced or massive fires, area should be evacuated. For small fires: use dry chemical, carbon dioxide; water spray; or foam. For large fires: flood area with water. If fire occurs in the vicinity of this compound, water should be used to keep containers cool. Cleanup and salvage operations should not be attempted until all of the peroxyacetic acid solution has cooled completely. Keep unnecessary people away; wear SCBA and full protective clothing. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions.

If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Perchloromethyl mercaptan is a pale yellow oily liquid with a foul-smelling, unbearable, acrid odor. Molecular weight = 185.9; Specific gravity (H_2O:1) = 1.7 @ 20°C; Boiling point = (decomposes) 149°C; Vapor pressure = 3 mmHg @ 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Perchloromethyl mercaptan is used as an intermediate for the synthesis of dyes and fungicides, such as Captan and Folpet. This chemical has been considered as a warfare tear gas because of its highly irritant properties.

Incompatibilities: Water contact forms HCl, sulfur and carbon dioxide. Reacts with alkalies, amines, hot water; alcohols, oxidizers, reducing agents; iron, and steel. Attacks most metals.

Permissible Exposure Limits in Air:

NIOSH IDLH = 10 ppm

Conversion factor: 1 ppm = 7.60 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.1 ppm/0.8 milligram per cubic meter TWA

NIOSH REL: 0.1 ppm/0.8 milligram per cubic meter TWA

ACGIH TLV[1]: 0.1 ppm/0.76 milligram per cubic meter TWA

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: $\mathbf{0.013_A}$ ppm

PAC-2: $\mathbf{0.30_A}$ ppm

PAC-3: $\mathbf{0.90_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 0.1 ppm (0.8 milligram per cubic meter), 1993; Austria: MAK 0.1 ppm (0.8 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.76 milligram per cubic meter), 1993; Denmark: TWA 0.1 ppm (0.8 milligram per cubic meter), 1999; Finland: STEL 0.1 ppm (0.8 milligram per cubic meter), 1999; France: VME 0.1 ppm (0.8 milligram per cubic meter), 1999; Norway: TWA 0.1 ppm (0.8 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.8 milligram per cubic meter, 2003; Switzerland: MAK-W 0.1 ppm (0.8 milligram per cubic meter), KZG-W 0.2 ppm, 1999; Turkey: TWA 0.1 ppm (0.8 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 ppm. Several states have set guidelines or standards for PMM in ambient air[60] ranging from 8.0 μ/m^3 (North Dakota) to 13.0 μ/m^3 (Virginia) to 16.0 μ/m^3 (Connecticut) to 19.0 μ/m^3 (Nevada).

Determination in Air: Sample collection by charcoal tube, analysis by gas liquid chromatography.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Signs and symptoms of acute exposure to perchloromethyl-mercaptan may lead to liver, heart, and kidney damage. Respiratory effects include coughing, dyspnea (shortness of breath), painful breathing; and lung congestion. Tachycardia (rapid heart rate) is often observed. Nausea, vomiting, abdominal cramping and diarrhea may also occur. Contact with Perchloromethyl mercaptan may result in severe dermatitis (red, inflamed skin), conjunctivitis (red, inflamed eyes), and burns with ulceration and severe pain. May cause death or permanent injury after short exposure to small quantities. Brief exposure to lower concentrations may produce CNS depression and lung, liver, and heart congestion. Severe exposures may be fatal. May be absorbed through the skin in quantities sufficient to cause general toxic effects. Ingestion may cause damage to mucous membranes and result in pain and burning of the mouth and throat; nausea, vomiting, cramps, and diarrhea. In severe cases, tissue ulceration and CNS depression may occur.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); sputum cytology; urinalysis (routine); white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)];* Sa (APF = 10) (any supplied-air respirator).* *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode);* PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)].* *Up to 5 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)];* or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place. Protect from moisture, metals, oxidizing and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1670 Perchloromethyl mercaptan, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.2/0.3

Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100

Then: Protect persons downwind (miles/kilometers)

Day 0.5/0.8

Night 0.9/1.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. It may be necessary to seek emergency assistance.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and sulfur oxides. Fight small fires with dry chemical, carbon dioxide; water spray; or foam, and large fires with water spray, fog, or foam. Move containers containing this compound away from fire area if possible. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Positive pressure breathing apparatus and special protective clothing should be worn. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration together with a flammable solvent in a furnace equipped with afterburner and scrubber.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group D, Not classifiable as a human carcinogen.

Hazard Alert: Poison, Possible neurotoxic effects (methyl carbamate), Combustible, Suspected reprotoxic hazard, Environmental hazard, Agricultural chemical.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: N; Risk phrases: R33; R50/53; R63; Safety phrases: S2; S29/35; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water[lit.].

Description: Colorless crystalline solid, or needles; white powder. Odorless. Commercial product is available as an emulsifiable concentrate. Molecular weight = 300.31; Specific gravity (H_2O:1) = 0.28 g/cm^3 @ 20°C; Boiling point = (decomposes) 145°C; Freezing/Melting point = 139−144°C; Vapor pressure = 1×10^{-11} mmHg @ 25°C; Flash point = 75°C. Very slightly soluble in water; solubility = 1 to 5 mg/mL @ 21°C; 4.7 mg/L @ 25°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: A postemergence bis-carbamate/carbamate ester herbicide used to control of annual broadleaf weeds and grasses in sugar beets, spinach, strawberries, and sunflowers.

Incompatibilities: Decomposes >145°C. Esters ith acids to liberate heat along with alcohols and acids. Strong oxidizing acids may cause a vigorous reaction that is sufficiently exothermic to ignite the reaction products. Heat is also generated by the interaction of esters with caustic solutions. Flammable hydrogen is generated by mixing esters with alkali metals and hydrides. Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas. Releases oxides of nitrogen and carbon when heated to decomposition.

Determination in Water: Octanol-water coefficient: Log K_{ow} = >3.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Skin absorption, ingestion, inhalation

Harmful Effects and Symptoms

Short-Term Exposure: Eye pupils are small, blurred vision, eye watering, runny nose, cough, shortness of breath, salivation, nausea, stomach cramps, diarrhea, and vomiting, increased blood pressure, profuse sweating, hypermotility, hallucinations, agitation, tingling of the skin, slow heartbeat, convulsions, fluid in lungs, loss of consciousness, incontinence, breathing stops, death. Carbamates inhibit the acetylcholinesterase enzymes and alter the way in which nervous impulses are transmitted. However, within several hours carbamates spontaneously detach from the enzymes. LD_{50} (oral, rat) = >7 g/kg; LD_{50} (dermal, rat) = >2 g/kg.

Long-Term Exposure: A potent acetylcholinesterase (AChE) inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. Frequent expsure may cause liver damage. May cause skin dermatitis or allergy.

Points of Attack: Respiratory system, lungs, CNS, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

Medical Surveillance: Preliminary medical examination to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical examinations of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Medical observation is recommended for 24−48 hours following breathing overexposure, as pulmonary edema may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When acetylcholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count and chest X-ray following acute overexposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated; protect eyes. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. *If conscious, alert, and able to swallow, rinse mouth and have victim drink 4−8 ounces of water. Check to see if poison control instructs you to use ipecac syrup, otherwise administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUnited States OR HAVING CONVULSIONS*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for carbamate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended

Note to physician or authorized medical personnel. Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Medical note:* 2-PAMCI may be contraindicated in the case of some carbamate poisonings. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material,

Spill Handling: First remove all sources of ignition. in all directions for at least 25 meters/75 feet. Increase, in the downwind direction, as necessary. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. Do not allow water to get inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. *On small fire*, use dry chemical powder, carbon dioxide, water spray, or foam. *On large fire*, use water spray, fog or alcohol-resistant foam. Do not scatter material using straight water jet streams. Dike fire control water for later disposal; do not scatter the material. Move containers from fire area if you can do it without risk. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not allow water to get inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, O; Risk phrases: R5; R8, R9, R10; R20; R21; R26/27; R48/23; Safety phrases: S1; S8; S9; S16; S17; S23; S26; S28; S33; S36/37/39; S38; S41; S43; S45 (see Appendix 4)

Description: Perchloryl fluoride is a colorless gas. Characteristic sweet odor. Shipped as a liquefied compressed gas. Molecular weight = 102.5; Specific gravity (H_2O:1) = 1.4 @ 20°C; Boiling point = −46.7°C; Freezing/Melting point = −146°C; Relative vapor density (air = 1) = 3.64; Vapor pressure = 10.5 atm @ 25°C; 8944 mmHg @ 25°C; Relative vapor density (air = 1) = 3.64. Explosive limits: LEL = 56,000ppm, UEL: unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 3 (Oxidizer). Slightly soluble in water; solubility = 0.06% @ 20°C.

Potential Exposure: Perchloryl fluoride has been used as a liquid oxidant in rocket propellant combinations; as an insulating gas in high voltage electrical systems; as a fluorinating agent in organic synthesis.

Incompatibilities: A strong oxidizing gas. Violent reaction with benzene, calcium hydride; combustibles, olefins, strong bases; sulfur, sulfuric acid; amines, reducing agents; alcohols. Contact with carbonaceous materials (such as charcoal) or finely divided metals (such as powdered magnesium and aluminum, zinc) are a fire and explosion hazard. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air:

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 4.19 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 3 ppm/13.5 milligram per cubic meter TWA

NIOSH REL: 3 ppm/14 milligram per cubic meter TWA; 6 ppm/28 milligram per cubic meter STEL

ACGIH TLV[1]: 3 ppm/13 milligram per cubic meter TWA; 6 ppm/25 milligram per cubic meter STEL

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: **1.5$_A$** ppm

PAC-2: **4$_A$** ppm

PAC-3: **12$_A$** ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 3 ppm (14 milligram per cubic meter); STEL 6 ppm, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Belgium: TWA 3 ppm (13 milligram per cubic meter); STEL 6 ppm (25 milligram per cubic meter), 1993; Denmark: TWA 3 ppm (14 milligram per cubic meter), 1999; Finland: TWA 3 ppm (14 milligram per cubic meter); STEL 6 ppm (25 milligram per cubic meter), 1999; France: VME 3 ppm (14 milligram per cubic meter), 1999; Norway: TWA 3 ppm (14 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 14 milligram per cubic meter, 2003; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 3 ppm (13 milligram per cubic meter), 1999; United Kingdom: TWA 3 ppm (13 milligram per cubic meter); STEL 6 ppm (26 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 6 ppm

Several states have set guidelines or standards for perchloryl fluoride in ambient air[60] ranging from 140−280 μ/m^3 (North Dakota) to 230 μ/m^3 (Virginia) to 270 μ/m^3 (Connecticut) to 333 μ/m^3 (Nevada).

Determination in Air: Sample collection by impinger or fritted bubbler; analysis by ion specific electrode.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the respiratory tract. May affect the blood, causing the destruction of red blood cells; formation of methemoglobinemia. Cyanosis and anemia may result. The liquid may cause frostbite.

Long-Term Exposure: May cause methemoglobinemia. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability and mottling of the teeth. Repeated exposure may cause nausea, vomiting, loss of appetite; diarrhea or constipation.

Points of Attack: Respiratory system, skin, blood.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite), methemoglobin; CBC; chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); sputum cytology; urine (chemical/metabolite); white blood cell count/differential. Consider the points of attack in preplacement and periodic physical examinations.

Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 30 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 75 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 100 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers should be isolated from acids, metals, organic materials, and ammonium nitrate. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, well ventilated area away from incompatible materials listed above. Store in a cool, well ventilated area away from incompatible materials listed above. Store in a cool, well ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3083 Perchloryl fluoride, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 5.1-Oxidizer, Inhalation Hazard Zone B. UN3157 Liquefied gas, oxidizing, n.o.s., Hazard Class: 2.2; Labels: 2.2-Non-flammable compressed gas, 5.1-Oxidizer, Technical Name Required. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Perchloryl fluoride

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2
Night 0.4/0.6
Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 1.6/2.6
Night 4.8/7.7
If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride, hydrogen chloride, fluorine and chlorine compounds and oxides of carbon. Nonflammable gas, but will support combustion and add to the intensity of an existing fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration together with flammable solvent in furnace equipped with afterburner and scrubber.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4
RCRA, 40CFR264, appendix 9, Ground Water Monitoring List, Suggested Testing Methods (PQL μg/L): 8100 (200); 8270 (10)
Superfund/EPCRA 40CFR302.4, Appendix A, Reportable Quantity (RQ): 100 lb (45.4 kg)
Canada, WHMIS, Ingredients Disclosure List Concentration: 1% as phenanthrene; 0.1% as coal tar pitch volatiles; DSL list.
Mexico, Drinking Water, Criteria (Ecological): 0.02 mg/L; wastewater: organic toxic pollutant.
Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, Xn, N; Risk phrases: R40; R22; R50/53; Safety phrases: S29/35; S36/37; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Phenanthrene is a white[2] crystalline substance. Weak aromatic odor. Polycyclic aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Molecular weight = 178.24; Specific gravity (H_2O:1) = 0.98 @ 4°C; Boiling point = 340°C @ 760 mmHg[2]; Freezing/Melting point = 99°C[2]; Flash point = 171°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Mutagen. Used for making dyes, other chemicals; explosives, pharmaceuticals; in biological research.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:

No specific standards have been established for phenanthrene.

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 5.4 milligram per cubic meter

PAC-2: 59 milligram per cubic meter

PAC-3: 360 milligram per cubic meter

DFG MAK: [skin]

Several states have set guidelines or standards for coal tar pitch volatiles in ambient air[60] ranging from zero (North Carolina) to 0.0161 μ/m^3 (Kansas) to 0.48 μ/m^3 (Pennsylvania) to 2.0 μ/m^3 (Connecticut and Virginia) to 5.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5506 polycyclic aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polycyclic aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0 ng/L, 2.8 ng/L, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0 ng/L, 31.1 ng/L, and 3.11 ng/L, respectively.

Determination in Water: Log $K_{ow} = > 4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Skin contact can cause irritation. A skin photo sensitizer, contaminated skin exposed to sunlight can develop rash, skin burns; and blisters. Irritates the eyes and respiratory tract.

Long-Term Exposure: May cause skin allergy. If allergy develops, very low future exposure can cause itching and skin rash.

Points of Attack: Skin, respiratory system; bladder, liver, kidneys.

Medical Surveillance: This chemical, according to ACGIH, is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists: CBC; chest X-ray; pulmonary function tests: Forced Vital Capacity; Forced Expiratory Volume (1 sec); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria[2].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and

face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration over 0.1 milligram per cubic meter:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well -ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Phenazopyridine & Phenazopyridine Hydrochloride P:0330

Formula: $C_{11}H_{12}ClN_5$

Synonyms: AP; 2,6-Diamino-3-phenylazopyridine; Diridone; DPP; Gastracid; Gastrotest; Mallophene; NC150; Phenazodine; Phenylazo; 3-(Phenylazo)-2,6-pyridinediamine; Pirid; Pyrazofen; Pyridacil; Pyridium; Pyripyridium; Sedural; Uridinal; Urodine; W 1655

hydrochloride: Azodine; Azodium; Azodyne; Azo gantrisin; Azo gastanol; Azo-mandelamine; Azomine; Azo-standard; Azo-stat; Azotrex; Baridium; Bisteril; Cystopyrin; Cystural; 2,6-Diamino-3-phenylazopyridine hydrochloride; 2,6-Diamino-3-(phenylazo)pyridine monohydrochloride; Di-azo; Diridone; Dolonil; Eucistin; Giracid; Mallofeen; Mallophene; NC150; NCI-C01672; Nefrecil; PAP; PDP; Phenazo; Phenazodine; Phenazopyridine hydrochloride; Phenazopyridinium chloride; β-Phenylazo-α,α'-diaminopyridine hydrochloride; 3-Phenylazo-2,6-diaminopyridine hydrochloride; Phenylazodiaminopyridine hydrochloride; Phenylazo-α,α'-diaminopyridine monohydrochloride; 3-(Phenylazo)-2,6-pyridinediamine, hydrochloride; Phenylazopyridine hydrochloride; Phenyl-idium; Phenyl-idium 200; Pirid; Piridacil; Pyrazodine; Pyrazofen; Pyredal; Pyridacil; Pyridenal; Pyridene; Pyridiate; Pyridium; Pyridivite; Pyripyridium; Pyrizin; Sedural; Suladyne; Sulodyne; Thiosulfil-A forte; Urazium; Uridinal; Uriplex; Urobiotic-250; Urodine; Urofeen; Uromide; Urophenyl; Uropyridin; Uropyrine; Utostan; Vestin; W 1655

CAS Registry Number: 94-78-0; 136-40-3 (hydrochloride)
HSDB Number: 3153
RTECS Number: US7700000; US7875000 (hydrochloride)
UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3249 (medicine, solid, toxic, n.o.s.)/151
EC Number: 202-363-2; 205-243-8 (hydrochloride)

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; (Phenazopyridine hydrochloride, CAS 136-40-3); IARC: Animal Sufficient Evidence; Human Limited Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (feed); clear evidence: mouse; (feed); clear evidence: rat.

California Proposition 65 Chemical[102]: Cancer 1/1/1988; 1/1/1988 (hydrochloride).

Hazard Alert: Poison, Possible risk of forming tumors, Drug. *Hydrochloride*: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Drug.

Hazard Symbols, Risk & Safety statements: Hazard Symbol (hydrochloride): T, C, Xn; Risk phrases: R45; R22; R34; R36/37/38; R40; R62 (hydrochloride); Safety phrases: S25; S26; S27; S34; S36/37/39; S45; (see Appendix 4)

Description: Phenazopyridine is a red crystalline compound. Molecular weight = 213.27; 249.73 (hydrochloride); Freezing/Melting point = (fine base) 139°C; 233−238°C (hydrochloride). Slightly soluble in water.

Potential Exposure: Phenazopyridine hydrochloride has been used for 50 years as an analgesic drug either alone or in combination with other drugs to reduce pain associated with urinary tract infection. An azo dye used in urinary tract infections. Also used as a local anesthetic. Exposure to phenazopyridine hydrochloride occurs during manufacture and formulation.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air:
No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can affect you if swallowed. Symptoms of exposure include diarrhea, nausea or vomitin; dehydration, decreased urine volume. May affect the development of red blood cells; causing cyanosis and methemoglobinemia and changes in blood sodium levels.

Long-Term Exposure: May affect the kidneys. Phenazopyridine hydrochloride was tested in mice and rats by oral administration. In female mice, it significantly increased the incidence of hepatocellular adenomas and carcinomas. In male and female rats, it induced tumors of the colon and rectum. Symptoms of exposure include deeply stained vomitus and urine, methemoglobinemia, Heinz body anemia; hepatic enlargement; abnormal renal function. May cause mutations.

Points of Attack: Blood. Kidneys.

Medical Surveillance: CBC. Kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Protect from air and light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Phenol is a colorless to light-pink, crystalline solid. Sweet, acrid odor. Phenol liquefies by mixing with about 8% water. The Odor Threshold in air is 0.04 ppm and in water is 7.9 ppm. Molecular weight = 94.12; Boiling point = 182°C; Freezing/Melting point = 42.8°C; Relative vapor density (air = 1) = 1.00 @ 20°C; Vapor pressure = 0.4 mmHg @ 25°C; Relative vapor density (air = 1): 3.2; Flash point = 79.4°C (cc); Autoignition temperature = 715°C. Explosive limits: LEL = 1.3%; 9,000 ppm[138]; UEL: 8.6%. Hazard Identification (based on NFPA-704 M Rating System) (*liquid, crystals*): Health 4, Flammability 2, Reactivity 1 (Corrosive). Soluble in water; solubility = 9% @ 25°C.

Potential Exposure: Phenol is used as a pharmaceutical, in the production of fertilizer; coke, illuminating gas; lampblack, paints, paint removers; rubber, asbestos goods; wood preservatives; synthetic resins; textiles, drugs, pharmaceutical preparations; perfumes, bakelite, and other plastics (phenolformaldehyde resins); polymer intermediates (caprolactam, bisphenol-A and adipic acid). Phenol also finds wide use as a disinfectant and veterinary drug.

Incompatibilities: Vapors may form explosive mixture with air. The aqueous solution is a weak acid. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, calcium hypochlorite; aluminum chloride. acids. Reacts with metals.

Permissible Exposure Limits in Air:

NIOSH IDLH = 250 ppm

Conversion factor: 1 ppm = 3.85 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/19 milligram per cubic meter TWA [skin]

NIOSH REL: 5 ppm/19 milligram per cubic meter TWA [skin]; 15.6 ppm/60 milligram per cubic meter/15 min. Ceiling Concentration

ACGIH TLV[1]: 5 ppm/19 milligram per cubic meter TWA [skin], not classifiable as a human carcinogen; BEI: 250 mg [total phenol]/g creatinine in urine/end-of-shift

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: **15**$_{\mathbf{A}}$ ppm

PAC-2: **23**$_{\mathbf{A}}$ ppm

PAC-3: **200**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK; [skin], Carcinogen Category: 3B

Arab Republic of Egypt: TWA 5 ppm (19 milligram per cubic meter), [skin], 1993; Australia: TWA 5 ppm (19 milligram per cubic meter), [skin], 1993; Austria: MAK 5 ppm (19 milligram per cubic meter), [skin], 1999; Belgium: TWA 5 ppm (19 milligram per cubic meter), [skin], 1993; Denmark: TWA 1 ppm (4 milligram per cubic meter), [skin], 1999; Finland: TWA 5 ppm (19 milligram per cubic meter); STEL 10 ppm (38 milligram per cubic meter), [skin], 1999; France: VME 5 ppm (19 milligram per cubic meter), [skin], 1999; the Netherlands: MAC-TGG 8 milligram per cubic meter, [skin], 2003Japan: 5 ppm (19 milligram per cubic meter), [skin], 1999; Norway: TWA 1 ppm (4 milligram per cubic meter), 1999; the Phillipines: TWA 5 ppm (10 milligram per cubic meter), [skin], 1993; Poland: MAC (TWA) 10 milligram per cubic meter; MAC (STEL) 20 milligram per cubic meter, 1999; Russia: TWA 5 ppm; STEL 0.3 milligram per cubic meter, [skin], 1993; Sweden: NGV 1 ppm (4 milligram per cubic meter), KTV 2 ppm (8 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 5 ppm (19 milligram per cubic meter), KZG-W 10 ppm (38 milligram per cubic meter), [skin], 1999; Thailand: TWA 5 ppm (19 milligram per cubic meter), 1993; Turkey: TWA 5 ppm (19 milligram per cubic meter), [skin], 1993; United Kingdom: TWA 5 ppm (20 milligram per cubic meter); STEL 10 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[35][43] has also set a MAC for ambient air in residential areas of 0.01 milligram per cubic meter (10 μ/m^3) both on a momentary and a daily average basis. Many states have set guidelines or standards for phenol in ambient air[60] ranging, for example, from 10.0 μ/m^3 (New York) to 45.23 μ/m^3 (Kansas) to 52.0 μ/m^3 (Massachusetts) to 95.0 μ/m^3 (Indiana) to 190 μ/m^3 (Florida, North Dakota, South Carolina) to 315.0 μ/m^3 (Virginia) to 380.0 μ/m^3 (Connecticut, North Dakota, South Dakota) to 452.0 μ/m^3 (Nevada) to 456.0 μ/m^3 (Pennsylvania) to 95.0 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #2546, Cresols and Phenol, OSHA Analytical Method 32.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 2000 μg/L; State Drinking Water Guidelines: California 4200 μg/L; Florida 10 μg/L; Maine 2100 μg/L; Minnesota 4000 μg/L; New Hampshire 4200 μg/L; Wisconsin 6000 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log $K_{ow} = 1.46$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Phenol and its vapor is corrosive to the eyes, skin, and respiratory tract. Eye contact can cause severe and painful burns and permanent damage. Skin contact may cause severe and painful burns, which promptly become anesthetized (numb) to touch, but deep damage and local gangrene can result. Significant skin contact or inhalation can cause death within minutes. Ulceration may follow. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the CNS; heart, liver, and kidneys; causing convulsions, coma, cardiac disorders; respiratory failure; collapse. Signs and symptoms of acute exposure to phenol may be severe, and range from tachycardia (rapid heart rate) and tachypnea (rapid respiratory rate) to hypotension (low blood pressure), weak pulse; cardiac failure; pulmonary edema; and respiratory arrest. Cardiac arrhythmias may be noted. Weakness, headache, dizziness, tinnitus (ringing in the ears), delirium, and shock are common. Seizures may often be followed by coma. Pallor, profuse sweating; dilated pupils; and a profound drop in body temperature may occur. Gastrointestinal effects may include nausea, abdominal pain; bloody vomitus; and bloody diarrhea. Renal insufficiency may lead to hematuria (bloody urine). Toxic hazard rating is very toxic: probable oral lethal dose (human) in 50−500 mg/kg. Ingestion of 1 gram has been lethal to humans. Lethal amounts may be absorbed through skin or inhaled. Industrial contact can cause chronic poisoning with kidney and liver damage.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. The substance may damage the liver, kidneys and have an effect on the pancreas; and heart muscle. May affect the CNS and cause nerve and/or brain damage. Phenol causes mutations and may cause reproductive damage in humans; and may be a cancer risk.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: niosh lists the following tests: liver function tests; urine (chemical/metabolite); urine (chemical/metabolite), last 2 hours of 8-hour exposure; urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), pre- & postshift; urinalysis. Urinary phenol (See also NIOSH #8305 *Phenol and p-cresol in urine*,). These tests should be repeated if overexposure is suspected. Interview for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If concentrated phenol gets on a large area of the skin, immediately rush victim to shower and use at full blast; remove all contaminated clothing; scrub the contaminated area with *soap* for at least 10 minutes—*water alone may be harmful*. If polyethyleneglycol-300 is available, swab exposed area with cotton soaked in it. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Rinse mouth. Give plenty of water and/or vegetable oil to drink. Do not allow the consumption of alcohol. Induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For phenol <30%, sealed chemical materials with good to excellent resistance: polyethylene. For phenol >70%, sealed chemical materials with good to excellent resistance: butyl rubber; Neoprene, Teflon, Viton, Silvershield. Also, polyethylene, offers limited protection. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 ppm:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; Sa (APF = 10) (any supplied-air respirator). *125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter) *250 ppm:* CcrFOv100 (APF = 50) [air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Phenol must be stored to avoid contact with calcium hypochlorite and other strong oxidizers (such as chlorine and bromine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping:

UN1671 Phenol, solid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2312 Molten phenol, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2821 Phenol solutions, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Remove all ignition sources. Spills must be disposed of immediately by properly protected personnel; no others should remain in area. Flush with flooding quantities of water, then use caustic soda solution for neutralization. Remove and isolate contaminated clothing at the site. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand; earth or similar material and deposit in sealed containers for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid or liquid. Flammable vapors are produced when phenol is heated. *Small fires:* dry chemical, carbon dioxide; water spray; or alcohol foam. *Large fires:* water spray, fog or foam; use water spray to cool containers in fire area. Move container from fire area if it can be done without risk; fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

EC Number: 202-196-5

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Positive: Cell transformation-SA7/SHE.

Hazard Alert: Combustible solid, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Sensitization hazard (skin), Environmental hazard.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements:1 Hazard Symbol: T, Xi, Xn, N; Risk phrases: R20/21/22; R36/37/38; R40; R43; R48/22; R50/53; R62; R63; Safety phrases: R22; S26; S29/35; S36/37/39; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Phenothiazine is a greenish-yellow to greenish-gray crystalline substance. Slight odor and taste. Molecular weight = 199.28; Boiling point = (decomposes) 371°C; Freezing/Melting point = 185°C (sublimes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Phenothiazine is used as an insecticide; as a base for the manufacture of tranquilizers; as anthelmintic in medicine and veterinary medicine; it is used widely as an intermediate in pharmaceutical manufacture; polymerization inhibitor, antioxidant.

Incompatibilities: Organosulfides are incompatible with strong acids and acid fumes; elevated temperatures; sulfur oxides and nitrogen oxides can be produced. Contact with strong reducing agents such as hydrides; azo and diazo compounds, halocarbons, isocyanates can generate heat and may form explosive hydrogen gas.

Permissible Exposure Limits in Air:

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter TWA [skin]

ACGIH TLV: 5 milligram per cubic meter TWA [skin]

Protective Action Criteria (PAC) not available

Australia: TWA 5 milligram per cubic meter, [skin], 1993; Belgium: TWA 5 milligram per cubic meter, [skin], 1993; Denmark: TWA 5 milligram per cubic meter, [skin], 1999; Finland: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, [skin], 1999; France: VME 5 milligram per cubic meter, [skin], 1999; Norway: TWA 5 milligram per cubic meter, 1999; the Phillipines: TWA 5 milligram per cubic meter, [skin], 1993; the Netherlands: MAC-TGG 5 milligram per cubic meter, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: 5 milligram per cubic meter [skin]. Several states have set guidelines or standards for Phenothiazine is ambient air[60] ranging from 50 μ/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Phenothiazine can affect you when breathed in and by passing through your skin. Exposure can irritate the skin and eyes. Exposure can cause an inflammation in the eye (keratitis). This can also be made worse by sunlight (photosensitization) and cause a severe skin reaction with rash and color changes. Can cause a severe allergic liver reaction. High levels of exposure may affect the blood cells, causing hemolytic anemia; and toxic liver degeneration. Exposure may affect the nervous system; causing muscle twitching and shaking. May affect heart rhythm, causing irregular heartbeat.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis and allergy. Can cause kidney and liver damage. Repeated or prolonged contact may cause skin sensitization as well as skin photophobia (abnormal visual intolerance to light). There is limited evidence that this chemical may damage the developing fetus. Several related phenothiazine compounds have been associated with human teratogenic effects.

Points of Attack: Skin, cardiovascular system, liver, kidneys, heart.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: examination of the nervous system and eyes. Liver function tests, especially bile salts. CBC. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothingmaterial for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric and nitric) since toxic fumes can result.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Phenothiazine may burn, but does not readily ignite. Thermal decomposition products may include oxides of sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in combustible solvent and spray into incinerator equipped with afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: 207-404-5

Regulatory Authority and Advisory Information.

Hazard Alert: Poison, Combustible, Suspected reprotoxic hazard, Possible endocrine disruptor, Environmental hazard.
Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins
Permissible Exposure Limits for Chemical Contaminants: (CAL/OSHA) as pyrethrum
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi, Xn, N; Risk phrases: R20/21/22; R36; R38; R50/53; R63; Safety phrases: S2; S13; S29/35; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Pale yellow to yellow-brown liquid. Molecular weight = 350.44; Specific gravity (H_2O:1) = 1.06 @ 20°C; Boiling point = 293°C; Vapor pressure = 1×10^{-7} mmHg @ 25°C; Flash point = 105. Henry's Law constant = 6.8×10^{-6} atm-m^3/mol @ 25°C (est)[83]. Practically insoluble in water.

Potential Exposure: d-Phenenothrin is a pyrethroid insecticide whic is used world-wide to control household insects and to protect stored grain. It is frequently formulated with other insecticides and is formulated in a number of carriers (aerosols, oil, dust, emulsifiable concentrates), and in powders, shampoos and lotion.

Incompatibilities: Keep away from alkaline materials. May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air:
NIOSH(2) IDLH = 5,000 ppm
OSHA PEL: 5 milligram per cubic meter TWA
NIOSH REL: 5 milligram per cubic meter TWA
ACGIH TLV[1]: 5 milligram per cubic meter TWA
STEL set by HSE(33) = 10 milligram per cubic meter.

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/UV. See NIOSH IV, Method #5008[18], pyrethrum.

Permissible Concentration in Water: Acceptable Daily Intake (ADI) = 0.02 mg/kg as pyrethroid

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 6.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Short-Term Exposure: Pyrethroids can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness, rhinorrhea (discharge of thin nasal mucous). Skin irritant/sensitizer my develop. LD_{50} (oral, rat) = > 5 g/kg[83].; LD_{50} (dermal, rat) = > 2 g/kg[83].

Long-Term Exposure: High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic "pneumonia" can also occur with cough, chest pain, breathing difficulty and abnormal chest X-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Dermal contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse

Points of Attack: Respiratory system, skin, CNS, liver, and kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Employees should be screened for history of certain medical conditions which might place the employee at increased risk from pyrethroid exposure. Chronic respiratory disease: In persons with chronic respiratory disease, especially asthma, the inhalation of pyrethroids might cause exacerbation of symptoms due to its sensitizing properties. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest X-ray if lung symptoms are present. Skin disease: Pyrethroids can cause dermatitis which may be allergic in nature. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont

Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: *50 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter).*250 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece).*5000 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison. Store in a secure poison location at temperature <35°C and away from alkaline materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3349 Pyrethroid pesticide, solid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material. UN3352 Pyrethroid pesticide, liquid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. *On a small fire:* use dry chemical, CO_2 or water spray.On a large fire: use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 meters/0.5 mile in all directions; also, consider initial evacuation for 800 meters/0.5 mile in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Hazard Symbols, Risk & Safety statements:1 Hazard Symbol: T; Risk phrases: R45; R22; R40; R62; R63; Safety phrases: S22; S36/36/39; S41; S45 (see Appendix 4).

Description: White crystalline solid or powder. Odorless. Molecular weight = 340.32; Boiling point = 382°C; Freezing/Melting point = 138−140°C (hydrochloride); Flash point = 185°C. Practically insoluble in water; solubility = <0.1 mg/mL @ 20°C.

Potential Exposure: Used as an antihypertensive drug.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Sensitive upon exposure to light and air. May form unstable and explosive peroxides upon standing.

Routes of Entry: Ingestion, inhalation

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure to this compound include nasal congestion, miosis, postural hypotension, tachycardia, gastrointestinal irritation, drowsiness and fatigue. May cause contact dematitis. LD_{50} = (oral-rat) <1 g/kg.

Long-Term Exposure: May cause cancer. Possible gastrointestinal tumors. Possible acute renal failure and acute tubular necrosis.

Points of Attack: Gastrointestinal system. Kidney, ureter, bladder.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method* if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed.

Personal Protective Methods: Wear positive pressure SCBA (SCBA). Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Sensitive to exposure to light and air. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. Keep unauthorized personnel away. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Containers may explode when heated. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters/0.5 in all directions; also, consider initial evacuation for 800 meters/0.5 in all directions. Small Fire: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Phenylcarbylamine Chloride P:0368

Formula: $C_7H_5Cl_2N$

Synonyms: Carbonimidic dichloride, phenyl-; *N*-(Dichloromethylene)aniline; Imidocarbonyl chloride, phenyl-; Phenylcarbonimidic dichloride; *N*-Phenyl-carbonimidic dichloride; Phenyl carbylamine chloride; Phenylimidocarbonyl chloride; *N*-Phenylimidophosgene; Phenyliminocarbonyl dichloride; *N*-Phenyliminocarbonyl dichloride; Phenylisonitrile dichloride

CAS Registry Number: 622-44-6

HSDB Number: 1255

RTECS Number: NJ6700000

UN/NA & ERG Number: (PIH) UN1672/151

EC Number: 210-735-0 [*Annex I Index No.:* 622-44-6]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Combustible, Corrosive, Lacrimator, Water reactive (corrosive fumes).

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazard Symbols, Risk & Safety statements:1 Hazard Symbol: T, F, Xn; Risk phrases: R10; R23; R20/21/22; R29; R34; R35; R36/37/38; Safety phrases: S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class):

Description: An oily, clear to pale -yellow liquid. Onion-like odor. Molecular weight = 174.03; Density 1.265 g/cm^3. Specific gravity (H_2O:1) = 1.29 @ 20°C; Boiling point = 210°C; Freezing/Melting point = 196°C; Flash point = 79°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0₩. Insoluble in water; slow decomposition with release of hydrogen chloride.

Potential Exposure: Phenylcarbylamine is used in organic synthesis; making other chemicals. A laboratory chemical and a former battlefield gas.

Incompatibilities: Reacts slowly with water releasing hydrogen chloride. Sealed containers stored at room temperature may explode, due to slow decomposition that builds up pressure. Heat increases the danger of explosion [101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. alcohols.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 2.5−2.9. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Phenylcarbylamine chloride is a potent vesicant/lacrimator. It may be fatal if inhaled, ingested, or through extended skin contact. Highly irritating to the eyes, skin, and respiratory tract. May be absorbed through the unbroken skin. Effects of contact or inhalation may be delayed. Inhalation exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. TCLo = (inhal., human) 7 ppm/10M[NTIS]

Long-Term Exposure: Information on the chemical, physical, and health effects of this chemical are limited.

Points of Attack: Respiratory system.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method* if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed.

Personal Protective Methods: Wear positive pressure SCBA. Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Respirator Selection: Where risk assessment shows air-pruifying respirators are appropriate, use a full-face respirator type (N100) United States or Type P3 (EN-143) respirators as backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied respirator. Use respirators and components tested and approved under appropriate government standards such aas NIOSH (US) or CEN (EU).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure, cool, poison location. Refrigerate. This material is somewhat volatile emits poisonous gas when heated; keep it out of direct sun and UV rays. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger.

Shipping: UN1672 Phenylcarbylamine chloride, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard; Inhalation Hazard Zone B. PGI.

Spill Handling: Although zzzxxx listed in the current Emergency Response Guide, the following is listed for reference.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters/150 feet for liquids and at least 25 meters/75 feet for solids. Keep unauthorized personnel away. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind. Keep out of low areas. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements or confined areas. Cover with plastic sheet to prevent spreading. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Non-combustible, substance itself does not burn but may decompose upon heating to produce corrosive and/or toxic fumes. Containers may explode when heated. Runoff from fire control or dilution water may be corrosive and/or toxic and may cause pollution. Runoff may pollute waterways. If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters/0.5 in all directions; also, consider initial evacuation for 800 meters/0.5 in all directions. Small Fire: Use dry chemical, CO_2 or water spray. *Large Fire*: Water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving Tanks or Car/Trailer Loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. *Do not* get water inside containers.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. It is not appropriate to dispose of expired or waste product such as lab chemicals by flushing them down the toilet or discarding them to the trash. Larger quantities shall carefully take into consideration applicable EPA, and FDA regulations. If possible return the lab chemicals to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste lab chemicals shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. All federal, state, and local environmental regulations must be observed.

As arsenic compounds:
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds
Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds
RCRA, 40CFR261, Appendix 8 Hazardous Constituents, D004 (arsenic compounds)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)
EPCRA (Section 313): Includes any unique chemical substance that contain arsenic as part of that chemical's infrastructure; Form R *de minimis* concentration reporting level: organics 1.0%.
United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B)
Canada: Priority Substance List & Restricted Substances/Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

Description: Phenyldichloroarsine is a colorless or light yellow liquid or gas. Odorless. Molecular weight = 222.93; Specific gravity (H_2O:1) = 1.65 @ 20°C; Boiling point = 254°C; Freezing/Melting point = −16°C; Flash point = 16°C; Vapor pressure = 0.021 mmHg @ 20°C;. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 2₩. Reaction with water; insoluble.

Potential Exposure: Phenyldichloroarsine is an organoarsenic compound used in organic synthesis and as a solvent. PD has been used as a military tear gas, vesicant and blister agent.

Incompatibilities: Contact with water forms HCl. Heat produces fumes of arsenic and chlorine. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some metals in the presence of moisture.

Permissible Exposure Limits in Air:
arsenic, organic compounds
NIOSH IDLH = 5 mg[As]/m^3
OSHA PEL: 0.5 mg[As]/m^3 TWA
NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A
ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.
Protective Action Criteria (PAC)* Ver. 29[138]
phenyl dichloroarsine; dichlorophenylarsine
PAC-1: 0.0055 milligram per cubic meter
PAC-2: **0.061**$_{\mathbf{A}}$ milligram per cubic meter
PAC-3: **0.18**$_{\mathbf{A}}$ milligram per cubic meter
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
DFG MAK: Carcinogen Category 3B; See section X(a)

Determination in Air: Filter; Reagent: Ion chromatography/hydride atomic absorption: NIOSH IV [#5022, Arsenic, organo-](18).

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA Maximum Contaminant Level (MCL): 0.010 mg[As]/L [40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Phenyldichloroarsine reacts with many enzymes which damages the body. Phenyldichloroarsine will blind you and blister your skin severely, and with enough it will kill. You will know that you've been exposed when you feel immediate pain and you begin to vomit violently. Contact may cause burns to skin and eyes. Strong irritant to eyes, skin, and tissue. Corrosive if swallowed. Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Vomiting and blistering are among symptoms of exposure. The median lethal dosage is 2600 mg-minute/m^3. The mean incapacitating dosage is 16 mg-minute/m^3 as a vomiting agent and 1800 mg-minute/m^3 as a blistering agent. 633 mg-minute/m^3 produces eye injury.

Long-Term Exposure: In animals: kidney damage; muscle tremor, seizure; possible gastrointestinal tract; reproductive effects; possible liver damage

Points of Attack: Skin, respiratory system; kidneys, CNS; liver, gastrointestinal tract; reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Test for urine arsenic. Levels should not be greater than 100 micrograms per gram of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you don't have the equipment and training don't enter the hot or the warm zone to rescue and decontaminate victims. If the victim can't move, decontaminate without touching and without entering the hot or the warm zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Wash—strip—wash—evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and up hill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (0.5%, or one part bleach to 200 parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Be sure you've decontaminated the victims as much as you can before they leave the area so that they don't spread the phenyldichloroarsine. Use the antidote "Anti-Lewisite." See above under "First Aid." Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 ounces per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3280 Organoarsenic compound, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required, Potential Inhalation Hazard (Special Provision 5). UN1556 Arsenic compounds, liquid, n.o.s. inorganic, including arsenates, n.o.s.; arsenites, n.o.s.; arsenic sulfides, n.o.s.; and organic compounds of arsenic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

Agent PD when used as a weapon

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, arsenic fumes and oxides of carbon. Phenyl dichloroarsine may burn but does not ignite readily. Burned phenyl dichloroarsine is safer better than the unburned product. In case of fire, evacuate the area. If there is some reason that you have to put out the fire—for example, there are things you can't let burn nearby—use unattended equipment. You can fight phenyl dichloroarsine fires with water streams, water fog; ordinary foam; universal foam; and, for confined fires, carbon dioxide. Remember that phenyl dichloroarsine breaks down in water, forming toxic hydrochloric acid and arsenic chemicals. Wear positive pressure breathing apparatus. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Water produces corrosive chlorine fumes. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to

fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Carcinogenicity: IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987. United States Environmental Protection Agency Gene-Tox Program, Positive: SHE-clonal assay; Histidine reversion-Ames test; Inconclusive: Rodent dominant lethal.

Hazard Alert: Poison, Combustible, Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Sensitization hazard (skin), Primary irritant (w/o allergic reaction), Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements:1 Hazard Symbol: T, N, Xi; Risk phrases: R20/21; R25; R3637/38; R40; R43; R50/53; R61; R62; R63; R68; Safety phrases: S1/2; S28; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: *m*-Phenylenediamine is a colorless to white crystalline substance that turns red upon exposure to air. Molecular weight = 108.16; Specific gravity (H_2O:1) = 1.14 g/cm^3 @ 20°C; Boiling point = 287°C; Freezing/Melting point = 64−66°C; Vapor pressure = 1 mmHg @ 100°C; Flash point = 137.8°C; Autoignition temperature = 555°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Used in making various dyes; as a curing agent for epoxy resin; rubber, textile fibers; urethanes, corrosion inhibitors; adhesives; in photographic and analytical procedures and processes.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid chlorides; acid anhydrides; chloroformates. Heat and light contribute to instability. Keep away from metals.

Permissible Exposure Limits in Air:

ACGIH TLV[1]: 0.1 milligram per cubic meter TWA [skin]; A4, not classifiable as a human carcinogen

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 21 milligram per cubic meter

PAC-3: 130 milligram per cubic meter

DFG MAK: [skin]; Carcinogen Category 3B

Austria [skin], Suspected: carcinogen, 1999; Denmark: TWA 0.1 milligram per cubic meter, 1999; Norway: TWA 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Determination in Air: Use OSHA Analytical Method 87.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the eyes and skin. Irritates the respiratory tract causing coughing, wheezing and/or shortness of breath. May affect the blood, causing the formation of methemoglobin and cyanosis with Blue coloration of the skin and lips; headache, fatigue, dizziness. High levels can cause troubled breathing; collapse and death. The *p*-isomer is more toxic and a more severe irritant than the *m*-isomers. LD_{50} = (oral-rat) 720-1600 mg/kg.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. If allergy develops, very low future exposure can cause itching and a skin rash. Repeated or prolonged inhalation exposure may cause asthma-like allergy. May cause kidney and liver impairment. Exposure may cause anemia.

Points of Attack: Respiratory system, skin, lungs, liver, kidneys, blood.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. CBC. Examination of the eyes and vision. Evaluation by a qualified allergist. Lung function tests. Blood methemoglobin levels. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical of more than 0.1 milligram per cubic meter, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1673 Phenylenediamines (*o-, m-, p-*), Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device[22].

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: *p*-Phenylenediamines are white to slightly red crystalline solids. They have been described as gray "light brown" which may result from exposure to air. Molecular weight = 108.14; 181.06 (dihydrochloride); Specific gravity (H_2O:1) = 1.1; Boiling point = 267°C (sublimes); Freezing/Melting point = 112.22°C[101]; Vapor pressure = < 1 mmHg @ 25°C; Flash point = 153.89°C; Autoignition temperature = 400°C. Explosive limits: LEL = 1.5%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 4% @ 25°C.

Potential Exposure: *p*-Phenylenediamine has been used in dyestuff manufacture, in hair dyes; in photographic developers; in synthetic fibers; polyurethanes, and as a monomer and in the manufacture of improved tire cords. Also used as a gasoline additive and in making antioxidants.

Incompatibilities: Dust may form explosive mixture with air. A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid chlorides; acid anhydrides; chloroformates, and strong bases. Incompatible with organic anhydrides; isocyanates, aldehydes. Heat and light contribute to instability. Keep away from metals.

Permissible Exposure Limits in Air:

NIOSH IDLH = 25 milligram per cubic meter

OSHA PEL: 0.1 milligram per cubic meter TWA[skin]

NIOSH REL: 0.1 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.1 milligram per cubic meter TWA; not classifiable as a human carcinogen

PAC-3: 29 milligram per cubic meter

DFG MAK: 0.1 milligram per cubic meter, measured as the, inhalable fraction TWA; Peak Limitation Category II (2); [skin], danger of skin sensitization; Carcinogen Category 3; Pregnancy Risk Group C

Australia: TWA 0.1 milligram per cubic meter, [skin], 1993; Austria: MAK 0.1 milligram per cubic meter, [skin], Suspected: carcinogen, 1999; Belgium: TWA 0.1 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter, [skin], 1999; Finland: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, [skin], 2003; the Phillipines: TWA 0.1 milligram per cubic meter, [skin], 1993; Poland: MAC (TWA) 0.1 milligram per cubic meter; MAC (STEL) 0.3 milligram per cubic meter, 1999; Russia: STEL 0.05 milligram per cubic meter, 1993; Sweden: NGV 0.1 milligram per cubic meter, KTV 0.3 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 0.1 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for *p*-phenylenediamine in ambient air[60] ranging from 0.33 μ/m^3 (New York) to 1.0 μ/m^3 (Florida, North Dakota, South Carolina) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use OSHA Analytical Method 87.

Permissible Concentration in Water: Russia[35,43] set a MAC in surface water of 0.1 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can severely irritate and burn the eyes and skin. May cause permanent eye damage. Irritates the respiratory tract causing coughing, wheezing, and/or shortness of breath. Inhalation of dust may irritate the pharynx and larynx; bronchia asthmatic reactions. Swelling of mouth and throat may be observed following ingestion. Exposure can cause abdominal pain; nausea, high blood pressure, dizziness, seizures, and even coma. May affect the blood, causing the formation of methemoglobin and cyanosis with Blue coloration of the skin and lips, headache, fatigue, dizziness. High levels can cause troubled breathing; collapse and death. The *p*-isomer is more toxic and a more severe irritant than the *o*- and *m*-isomers.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. If allergy develops, very low future exposure can cause itching and a skin rash. Repeated or prolonged inhalation exposure may cause asthma-like allergy. May cause kidney and liver impairment. Repeated high exposure can cause cataracts. Exposure may cause anemia.

Points of Attack: Respiratory system, skin, lungs, liver, kidneys, blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Consider the points of attack in preplacement and periodic physical examinations. CBC. Examination of the eyes and vision. Evaluation by a qualified allergist. Lung function tests. Blood methemoglobin levels. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or a slurry of activated charcoal in water; and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5 milligram per cubic meter:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 25 milligram per cubic meter:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Causes eye irritation and damage; eye protection needed.

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, strong acids; acid chlorides; acid anhydrides; chloroformates and metals. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: UN1673 Phenylenediamines (*o-, m-, p-*), Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Establish forced ventilation to keep levels below explosive limit. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device[22].

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1999; NIOSH: Potential occupational carcinogen. United States Environmental Protection Agency Gene-Tox Program, Positive: SHE-focus assay

California Proposition 65 Chemical[102]: Cancer 10/1/1990. *Developmental/Reproductive toxin, male delisted 4/4/2014*.

Hazard Alert: Poison, Combustible, Combustible, Possible polymerization hazard, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Sensitization hazard, Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, N, Xi; Risk phrases: R45; R20; R36/37/38; R43; R68; R52/53; R62; R63; Safety phrases: S29/35; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Phenyl glycidyl ether is a colorless liquid with an unpleasant sweet odor. Molecular weight = 150.19; Specific gravity (H_2O:1) = 1.11; Boiling point = 245°C; Freezing/Melting point = 3.3°C; Vapor pressure = 0.01 mmHg @ 20°C; Flash point = 120°C. Explosive limits: LEL = 1.1%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.24% @ 20°C.

Potential Exposure: PGE is used to increase storage time and stability of halogenated compounds; as a reactive diluent in uncured epoxy resins to reduce the viscosity of the uncured system for ease in casting; adhesive, and laminating applications. NIOSH once estimated that 8000 workers are potentially exposed to PGE.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, amines, and curing agents. PGE can presumably form explosive peroxides.

Permissible Exposure Limits in Air:

NIOSH IDLH = 100 ppm, potential occupational carcinogen.

Conversion factor: 1 ppm = 6.14 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/60 milligram per cubic meter TWA

NIOSH REL: 1 ppm/6 milligram per cubic meter [15-min.] Ceiling Concentration; A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 0.1 ppm TWA [skin] danger of skin sensitization; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC) not available

DFG MAK: [skin], danger of skin sensitization; Carcinogen Category 2

Australia: TWA 1 ppm (6 milligram per cubic meter), 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA

1 ppm (6.1 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (5 milligram per cubic meter), 1999; Finland; STEL 10 ppm (60 milligram per cubic meter), [skin], 1999; France: VME 1 ppm (6 milligram per cubic meter), 1999; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; the Phillipines: TWA 10 ppm (62 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.6 milligram per cubic meter; MAC (STEL) 3 milligram per cubic meter, 1999; Sweden: NGV 10 ppm (60 milligram per cubic meter), KTV 15 ppm (90 milligram per cubic meter), 1999; Switzerland: MAK-W 1 ppm (6 milligram per cubic meter), [skin], carcinogen, 1999; Turkey: TWA 10 ppm (60 milligram per cubic meter), 1993; United Kingdom: TWA 1 ppm (6.2 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for PGE in ambient air[60] ranging from 60 μ/m^3 (Connecticut and North Dakota) to 100 μ/m^3 (Virginia) to 143 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV), Phenyl glycidyl ether.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 1.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The substance irritates the eyes, skin, and the upper respiratory tract. Eye and skin irritation may be severe. Exposure could cause lowering of consciousness, with headaches; loss of concentration; dizziness and unconciousness.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Possible hematopoietic, reproductive effects. A potential occupational carcinogen.

Points of Attack: Eyes, skin, CNS; hematopoietic system; reproductive system. The liquid destroys the skin's natural oils, causing dermatitis. Cancer site in animals: nasal cancer.

Medical Surveillance: NIOSH lists the following tests: pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber; natural rubber, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated ina pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a refrigerator or in a cool, dry place. Protect from exposure to acids, bases, oxidizers, and curing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well, first with 60−70% ethanol; then with soap and with 60−70% ethanol; then with soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides-discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides-perforation of a container of the waste from a safe distance followed by open burning.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol (*includes hydrochloride*): T, F, N, Xi; Risk phrases: R45; R10; R23/24/25; R29/35; R36/38; R43; R48/23/24/25; R50; R62; R63; R68; R50; Safety phrases: S29/35; S53; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Phenylhydrazine is a colorless to pale yellow liquid or solid with a weak aromatic odor. The hydrochloride is a white to tan solid with a weak odor. Molecular weight = 108.16; 144.62 (hydrochloride); Specific gravity (H_2O:1) = 1.1 @ 20°C (base); Boiling point = (decomposes) 244°C (base); Freezing/Melting point = 20°C (base); 24°C (hemihydrate); 243−246°C (hydrochloride); Vapor pressure = 0.026 mmHg @ 25°C; Flash point = 88.9°C (cc) (base); Autoignition temperature = 174°C (base). Explosive limits: LEL = 1.1%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2; (*hydrochloride*). Slightly soluble in water.

Potential Exposure: Phenylhydrazine is a widely used reagent in conjunction with sugars, aldehydes, and ketones. In addition, to its use in the synthesis of dyes; pharmaceuticals, such as antipyrin; cryogenin, and pyramidone; and other organic chemicals. The hydrochloride salt is used in the treatment of polycythemia vera.

Incompatibilities: Phenylhydrazine is very reactive with carbonyl compounds, strong oxidizers; strong bases; alkali metals; ammonia, lead dioxide (violent). Attacks copper salts, nickel, and chromates.

Permissible Exposure Limits in Air:

NIOSH IDLH = 15 ppm, potential occupational carcinogen.

Conversion factor: 1 ppm = 4.42 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/22 milligram per cubic meter TWA [skin]

NIOSH REL: 0.14 ppm/0.6 milligram per cubic meter [120-min.] Ceiling Concentration [skin] A potential occupational carcinogen. [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 0.1 ppm/0.44 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC) Ver. 29[138]

100-63-0, phenylhydrazine

PAC-1: 0.3 ppm

PAC-2: 6.4 ppm

PAC-3: 295 ppm

59-88-1, phenylhydrazine hydrochloride

PAC-1: 23 milligram per cubic meter

PAC-2: 250 milligram per cubic meter

PAC-3: 1500 milligram per cubic meter

DFG MAK: [skin], danger of skin sensitization; Carcinogen Category 3B

Arab Republic of Egypt: TWA 5 ppm (20 milligram per cubic meter), [skin], 1993; Australia: TWA 5 ppm (20 milligram per cubic meter); STEL 10 ppm, [skin], carcinogen, 1993; Austria: MAK 5 ppm (22 milligram per cubic meter), [skin], Suspected: carcinogen, 1999; Belgium: TWA 5 ppm (22 milligram per cubic meter); STEL 10 ppm, [skin], carcinogen, 1993; Denmark: TWA 0.1 ppm (0.6 milligram per cubic meter), [skin], 1999; Finland: STEL 5 ppm (22 milligram per cubic meter), [skin], 1999; Norway: TWA 0.6 milligram per cubic meter, 1999; the Phillipines: TWA 5 ppm (22 milligram per cubic meter), 1993; Poland: MAC (TWA) 20 milligram per cubic meter, 1999; Switzerland: MAK-W 5 ppm (22 milligram per cubic meter), [skin], 1999; Turkey: TWA 5 ppm (22 milligram per cubic meter), [skin], 1993; United Kingdom: CHAN, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic:[35] MAC 1.0 milligram per cubic meter. Several states have set guidelines or standards for phenylhydrazine in ambient air[60] ranging from zero (North Dakota) to 66.7 μ/m^3 (New York) to 200.0 μ/m^3 (Connecticut, Florida, South Carolina and Virginia) to 476.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3518.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.01 mg/L of phenylhydrazine.

Determination in Water: Octanol-water coefficient: Log K_{ow} = 1.25. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: The dust and fumes can irritate and burn the eyes and skin. Inhalation can cause irritation, coughing, and difficult breathing. This material is poisonous if swallowed or if fumes are inhaled. Phenylhydrazine is a chronic poison. High levels can cause cyanosis and methemoglobinemia. Higher levels can cause troubled breathing; collapse, and even death. Exposure can cause headache, nausea, vomiting, lightheadedness, nervousness, shaking, seizures, and coma.

Long-Term Exposure: Repeated or prolonged contact may cause skin irritation, dermatitis, sensitization and allergy. May affect the blood, causing red cell damage, cyanosis, hemolytic anemia; kidney, and liver damage; vascular thrombosis. A potential occupational carcinogen; it may cause leukemia.

Points of Attack: Blood, respiratory system; liver, kidneys, skin. Cancer site in animals: tumors of the lungs, liver, blood vessels and intestine. May affect the bone marrow and cause leukemia.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: blood plasma, hemoglobin; CBC; liver function tests; pulmonary function tests; urine (chemical/metabolite), hemoglobin; urinalysis (routine); white blood cell count/differential. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code-Blue (*hydrochloride, 59-88-1*): Health Hazard: Store in a secure poison location. (2) Color code-Red Stripe (*100-63-0*): Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere and protect from exposure to light, strong bases; ammonia, oxidizers, metal salts. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2572 Phenylhydrazine, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid contact with solid and dust. Restrict access. Disperse and flush. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* collect powdered material in the most convenient and safest manner and deposit in sealed containers; move container from spill area. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid or solid, but does not easily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Flammable liquid, Suspected reprotoxic hazard, Lacramator; Sensitization hazard (skin, lungs), Electrostatic hazard.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F, Xi; Risk phrases: R10; R22; R26; R34; R37; R42/43; R51; Safety phrases: S/23; S/26; S28; S36/37/39; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Phenyl isocyanate is a colorless liquid with an irritating odor. Molecular weight = 119.30; Boiling point = 160°C; Freezing/Melting point = −30°C; Flash point = 50−56°C; Autoignition temperature = >500°C. Explosive limits: LEL = 1.2%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Decomposes in water.

Potential Exposure: Phenyl isocyanate is used as a laboratory reagent and in organic synthesis.

Incompatibilities: May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acyl-chlorides may cause explosive polymerization. Contact with metals may evolve flammable hydrogen gas. Attacks some plastics, rubber and coatings. Contact with metals may evolve flammable hydrogen gas. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 8.70E-04 ppm

PAC-2: $\mathbf{0.0096}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{0.029}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript “**A**” and correspond to 60 minute values.

DFG MAK: Danger of skin and airway sensitization.

Russia[43] set a MAC in workplace air of 0.5 milligram per cubic meter.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Phenyl isocyanate can affect you when breathed in and by passing through your skin. Exposure can strongly irritate the skin, nose, throat and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. LD_{50} = (oral-rat) 800 mg/kg.

Long-Term Exposure: Phenyl isocyanate can cause an asthma-like lung allergy to develop with cough, shortness of breath and wheezing. Possible lung and allergic skin rash.

Points of Attack: Lungs, skin.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure. Evaluation by a dermatologist. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to phenyl isocyanate exists, as a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2487 Phenyl isocyanate, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.0/1.5

Night 1.6/2.5

Fire Extinguishing: Phenyl isocyanate may burn, but does not readily ignite. Thermal decomposition products may include oxides of nitrogen. Containers may explode in fire. Use dry chemical, CO_2, water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+; F, N, Xi; Risk phrases: R11; R23/24/25; R26; R29/35; R36/37/38; R41; R62; Safety phrases: S16; S21; S23; S25; S26; S28; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Phenyl mercaptan is a water white liquid. Repulsive, penetrating, rotten cabbage, garlic-like odor. Molecular weight = 110.18; Specific gravity (H_2O:1) = 2 @ 25 C°; Boiling point = 170°C; Freezing/Melting point = −9.4°C; 15°C; Vapor pressure = 1 mmHg @ 18°C; 2 mmHg @ 25°C; Flash point = 55.6°C. Explosive limits: LEL = 1.2%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Phenyl mercaptan is used as a chemical intermediate in pesticide manufacture; as a mosquito larvicide. It is used in solvent formulations for the removal of polysulfide sealants.

Incompatibilities: At normal room temperature may vaporize forming explosive mixture with air. Violent reaction with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, calcium hypochlorite, alkali metals. Oxidizes on exposure to air; supplied under nitrogen.

Permissible Exposure Limits in Air:

Odor threshold + 0.0003 ppm.

OSHA PEL: None

NIOSH REL: 0.1 ppm/0.5 milligram per cubic meter [15-min.] Ceiling Concentration

ACGIH TLV[1]: 0.1 ppm/0.45 milligram per cubic meter TWA [skin]

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: $\mathbf{0.53_A}$ ppm

PAC-3: $\mathbf{1.6_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 0.5 ppm (2 milligram per cubic meter), 1993; Belgium: TWA 0.5 ppm (2.3 milligram per cubic meter), 1993; Denmark: TWA 0.5 ppm (2.3 milligram per cubic meter), 1999; Finland: STEL 0.5 ppm (2.6 milligram per cubic meter), 1993; France: VME 0.5 ppm (2 milligram per cubic meter), 1999; Norway: TWA 0.5 ppm (2 milligram per cubic meter), 1999; Switzerland: MAK-W 0.5 ppm (2.3 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 ppm

Several states have set guidelines or standards for benzenethiol in ambient air[60] ranging from 20 μ/m^3 (North Dakota) to 35 μ/m^3 (Virginia) to 40 μ/m^3 (Connecticut) to 48 μ/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2075

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 2.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Highly toxic via all routes. Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Benzenethiol can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Benzenethiol can severely burn the eyes, causing permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause weakness, dizziness, cough, wheezing, dyspnea (breathing difficulty). Higher levels can cause restlessness and irritability followed by paralysis and death. High or repeated exposure can cause liver, kidney or lung damage. Acute exposure to thiophenol may result in cough, troubled breathing; irritation of the lungs; and pneumonitis. Nausea, vomiting, and diarrhea are often seen. May affect the nervous system.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May cause lung, kidney, liver, spleen damage.

Points of Attack: Eyes, skin, respiratory system; CNS; kidneys, liver, spleen

Medical Surveillance: If symptoms develop or overexposure is suspected, tests of the following may be helpful: Kidney and liver function. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. If available, flush eyes with large amounts of 0.5% silver nitrate, followed immediately by very large amounts of water. Continue water for 15 minutes. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 1 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 5 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store under nitrogen in a secure poison location. (2) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in air-tight containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, should be prohibited where benzenethiol is handled, used, or stored. Use only non-sparking tools and equipment, especially when opening and closing containers of benzenethiol.

Shipping: UN2337 Phenyl mercaptan, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid, Inhalation zone B.

Spill Handling:
Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5
Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include sulfur dioxide and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in flammable solvent and burn in furnace equipped with afterburner and alkaline scrubber[22].

EC Number: 200-532-5 [*Annex I Index No.:* 080-011-00-5]
Regulatory Authority and Advisory Information
Carcinogenicity: IARC: Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1993.

United States Environmental Protection Agency Gene-Tox Program, Positive: D *melanogaster*-whole sex chrom. loss; Positive: D *melanogaster*-nondisjunction; B *subtilis* rec assay.

California Proposition 65 Chemical[102]: Developmental toxin as mercury compounds.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Organometallic, Strong reducing agent, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

Banned or Severely Restricted (several countries) (UN)[13]

United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg [Hg]/L as mercury

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P092

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B), severe pollutant

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R25; R34; R48/24/25; R50/53; R62; R63; Safety phrases: S1/2; S3; S24/25; S29/35; S37; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Phenylmercury acetate is a white or yellow crystalline solid. Molecular weight = 336.75; Freezing/Melting point = 148.9°C; Vapor pressure = 9 mmHg @ 95°C; Flash point = 60°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 1500 ppm @ 15°C; 0.44 g/100 mL @ 20°C.

Potential Exposure: Phenylmercury acetate is used as an antiseptic, fungicide; for fungal and bacterial control; herbicide and control of crabgrass; mildewcide for paints; slimicide in paper mills. It was also used in contraceptive gels and foams.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, halogens.

Permissible Exposure Limits in Air:

as organo mercury compound

NIOSH IDLH = 2 mg[Hg]/m^3

OSHA PEL: 0.01 milligram per cubic meter TWA; 0.04 milligram per cubic meter Ceiling Concentration

NIOSH REL: 0.01 milligram per cubic meter TWA; 0.03 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.01 milligram per cubic meter TWA; 0.03 milligram per cubic meter STEL [skin]

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 2 milligram per cubic meter

PAC-2: 22 milligram per cubic meter

PAC-3: 47 milligram per cubic meter

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3

Australia: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3, [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, [skin], 1999; Finland: TWA 1 mg[Hg]/m^3, 1999; France: VME 0.1 mg[Hg]/m^3, [skin], 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Phillipines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3; MAC (STEL) 0.15 mg [Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg[Hg]/m^3, [skin], 1999; Thailand: STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: LTEL 0.05 mg[Hg]/m^3; STEL 0.15 mg[Hg]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 mg[Hg]/m^3 [skin]

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 micron filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Overexposure affects the kidneys, causing renal function failure. Extremely toxic. The probable oral lethal dose for humans is 5−50 mg/kg, between 7 drops and 1 teaspoonful for a 70 kg (150 lb) person. Symptoms arising from acute exposure may occur at varying intervals Up to several weeks following exposure. Ingestion of mercurial fungicide treated grain resulted in gastrointestinal irritation with nausea, vomiting, abdominal pain; and diarrhea. Alkylmercurials produce severe neurologic toxicity, such as loss of feeling in lips, tongue, and extremities; confusion, hallucinations, irritability, sleep disturbances; staggering walk; memory loss; slurred speech; auditory defects; emotional instability; and inability to concentrate. It is also a strong skin irritant; erythema and blistering may result 6−12 hours after exposure. Phenylmercury acetate, at sufficient concentration, is expected to be injurious to the eye externally. Mercury poisoning can cause “shakes,” irritability, sore gums; increased saliva; personality change and brain damage. Skin contact can cause burns, skin allergy and a gray skin color. Heating or contact with acid or acid “fumes” releases toxic mercury vapors.

Long-Term Exposure: Mercury accumulates in the body. Repeated or prolonged contact with skin may cause dermatitis. May affect the nervous system; causing nervous disorders. Based on animal tests, phenylmercuric acetate should be handled as a teratogen-with extreme caution. It also may cause mutations.

Points of Attack: Eyes, skin, CNS, peripheral nervous system, and kidneys.

Medical Surveillance: Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with: examination of the nervous system; including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider lung function tests for persons with frequent exposures. After suspected illness or overexposure, repeat the above tests and get a blood test for mercury. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Antidotes and Special Procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #73-11024.

Respirator Selection: *Up to 0.1 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 milligram per cubic meter:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 2 milligram per cubic meter:* SA: PD, PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Sources of ignition, such as smoking and open flames, are prohibited where phenylmercuric acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1674 Phenylmercuric acetate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, foam, or carbon dioxide on solution. Use water as necessary, but run-off should be limited and controlled to prevent it from entering streams of water supplies. Materials are extremely hazardous to health, but areas may be entered with extreme care. Full protective clothing, including SCBA; rubber gloves; boots and bands around legs, arms, and waist should be provided. No skin should be exposed. Thermal decomposition products may include mercury. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. React to produce soluble nitrate form, precipitate as mercuric sulfide. Return to supplier.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Limited Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1978; NCI: Carcinogenesis Studies (feed); equivocal evidence: mouse; no evidence: rat; NIOSH (*since metabolized to β-naphthylamine*): Potential occupational carcinogen.

Hazard Alert: Poison, Possible risk of forming tumors, Suspected reprotoxic hazard, Sensitization hazard, Environmental hazard.

Banned or Severely Restricted (Sweden) (UN)[13]

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) as naphthalenes

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N, Xi; Risk phrases: R36/38; R40; R43; R51/53; Safety phrases: S2; S26; S29/35; S36/37; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Phenyl-β-naphthylamine is a light gray powder. A combustible solid. Molecular weight = 219.30; Specific gravity (H_2O:1) = 1.24; Boiling point = 396°C; Freezing/Melting point = 107.8°C. Insoluble in water.

Potential Exposure: Phenyl-β-naphthylamine is used as a rubber antioxidant; as an inhibitor for butadiene; a stabilizer in lubricants and an intermediate in chemical synthesis.

Incompatibilities: Incompatible with oxidizers, strong acids; organic anhydrides; isocyanates, aldehydes.

Permissible Exposure Limits in Air:

OSHA PEL: None

NIOSH REL: A potential occupational carcinogen* [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A. [**Note:* Since metabolized to β-naphthylamine].

ACGIH TLV[1]: not classifiable as a human carcinogen

Protective Action Criteria (PAC) not available

DFG MAK: Carcinogen Category 3B

Australia: carcinogen, 1993; Austria: Suspected: carcinogen, 1999; Belgium: carcinogen, 1993; Finland: carcinogen, 1999; Poland: MAC (TWA) 0.03 milligram per cubic meter, 1999; Sweden: carcinogen, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Several states have set guidelines or standards for this compound in ambient air[60] ranging from zero (North Dakota) to 3.0 μ/m^3 (Virginia) to 45.0 μ/m^3 (Pennsylvania).

Determination in Air: Use OSHA Analytical Method 96.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Naphthalenes and naphthenic acids are listed as United States DOT marine pollutants and may persist in the environment.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The main problem with this compound is that phenyl-β-naphthylamine, a known carcinogen, is both a contaminant in, and a metabolic product of PBNA. Phenyl-β-naphthylamine can affect you when breathed in and by passing through your skin. Contact can cause skin irritation and rash. Phenyl-β-naphthylamine should be handled as a carcinogen-with extreme caution. Exposure can affect the ability of the blood to carry oxygen (methemoglobinemia), causing cyanosis, a bluish skin color. Higher levels can cause headache and dizziness. Very high levels can cause death. LD_{50} = (oral-mouse) 1450 kg/mg.

Long-Term Exposure: Repeated or prolonged contact may cause skin irritation, sensitization, allergy; hypersensitivity to sunlight. A potential occupational carcinogen. Can cause methemoglobinemia (see above); anemia may result.

Points of Attack: Eyes, skin, bladder. *Cancer site:* bladder cancer; in animals: lung, pancreas.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: methemoglobin level. CBC.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage:Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and oil. A regulated, marked area should be established where *N*-phenyl-β-naphthylamine is handled, used, or stored.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Chemical[102]: Cancer 8/4/2000.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xi, N; Risk phrases: R36/38; R50; R62; R63; Safety phrases: S2; S22; S29/35; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *o*-Phenylphenol is a white to buff-colored crystalline solid. Molecular weight = 170.22; Boiling point = 286°C; Freezing/Melting point = 57°C; Flash point = 124°C; Autoignition temperature = 530°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: *o*-Phenylphenol is used in the manufacture of plastics, resins, rubber, as Agricultural chemical, in making fungicides; as an intermediate in making dye stuffs and rubber chemicals; a germicide; used in food packaging.

Incompatibilities: Strong bases, strong oxidizers.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 29 milligram per cubic meter

PAC-2: 320 milligram per cubic meter

PAC-3: 400 milligram per cubic meter

DFG MAK: No numerical value established. Other data may be available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. High exposures may affect the kidney, liver, and lungs; gastrointestinal tract; cardiovascular system, causing respiratory failure. *Inhalation:* Dusts can cause irritation of the nose, throat and lungs. *Skin:* Can cause severe irritation and burns. Concentrations of 0.5% or higher of the sodium form can cause irritation. *Eyes:* Can cause severe irritation, burns, and damage to cornea, especially the sodium form. *Ingestion:* Based on studies of phenol, can cause burning sensation and pain in mouth and throat, sores, abdominal pain; nausea, vomiting, diarrhea and skin rash. Larger doses may also cause muscle weakness, irregular rapid breathing; Blue coloration of the skin; shock, unconsciousness, collapse and death. Based on animal studies, 5 ounces would be lethal to a 150 lb healthy adult.

Long-Term Exposure: May cause kidney damage. Prolonged skin contact may cause severe irritation, sores, and skin allergy. Very irritating substances may affect the lungs; bronchitis may develop.

Points of Attack: Lungs, kidneys, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to o-phenylphenol, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water. Sources of ignition, such as smoking and open flames, are prohibited where o-phenylphenol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Phenylphosphine P:0480

Formula: C_6H_7P; $C_6H_5PH_2$

Synonyms: Fenylfosfin; Monophenylphosphine; PF; Phosphaniline

CAS Registry Number: 638-21-1

HSDB Number: 7199

RTECS Number: SZ2100000

UN/NA & ERG Number: UN2845 (Pyrophoric liquids, organic, n.o.s)/135

EC Number: 211-325-4

Regulatory Authority and Advisory Information

California Proposition 65 Developmental/Reproductive toxin 8/7/2009

Hazard Alert: Poison, Flammable liquid, Pyrophoric hazard, Strong reducing agent, Water reactive, Self-heating, Corrosive, Environmental hazard, Reproductive toxin.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, T, N, Xn; Risk phrases: R6; R11; R17; R20/21/

22; R23/24/25; R36/37/38; R39; R48/20; R51/53; R62; R65; R67; Safety phrases: S7; S16; S26; S29/35; S36/37/38; S45; S61; S62 (see Appendix 4)

Description: Phenylphosphine is a clear, colorless liquid. Foul odor. Molecular weight = 110.10; Specific gravity (H_2O:1) = 1.00 @ 16°C; Boiling point = 161°C; Freezing/Melting point = 13.8°C; Flash point = 73.3°C. ₩Low solubility in water; solubility = < 1 mg/mL @ 21°C. Decomposes in water forming noxious gases.

Potential Exposure: Polyphosphinate is used as an intermediate or a chemical reagent. Polyphosphinate compounds are used as catalysts and antioxidants disproportionate, when heated to give phosphonic acid derivatives plus PF.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Water reactive; spontaneously combustible in high concentrations in moist air. Potential exposure to gaseous phenylphosphine and phosphorus oxides when heated above 200°C. Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101].

Permissible Exposure Limits in Air:

Conversion factor: 1 ppm = 4.50 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.05 ppm/0.25 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 0.05 ppm/0.23 milligram per cubic meter Ceiling Concentration

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.0045 ppm

PAC-2: 0.05 ppm

PAC-3: 1.7 ppm

Australia: TWA 0.05 ppm (0.25 milligram per cubic meter), 1993; Belgium: STEL 0.05 ppm (0.23 milligram per cubic meter), 1993; Denmark: TWA 0.05 ppm (0.25 milligram per cubic meter), 1999; Finland: STEL 0.05 ppm (0.25 milligram per cubic meter), 1999; France: VLE 0.05 ppm (0.25 milligram per cubic meter), 1999; Switzerland: MAK-W 0.05 ppm (0.25 milligram per cubic meter), 1999; the Netherlands: MAC 0.25 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.05 ppm. Several states have set guidelines or standards for PF in ambient air[60] ranging from 2.0 μ/m^3 (Virginia) to 2.5 μ/m^3 (North Dakota) to 6.0 μ/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: A level of 0.6 ppm is a threshold effect level for laboratory animals; hypersensitivity to sound and touch and mild hyperemia developed above this level. Above 2.2 ppm, chronic effects developed including decreases in red blood cells, dermatitis and severe testicular degeneration (which was, however, reversible)[53]. This material is highly toxic by inhalation and ingestion; mild respiratory irritant. Symptoms of exposure include mild respiratory irritation, dyspnea; nausea, vomiting, diarrhea, thirst; sensation of pressure in the chest; back pains; chills; stupor, and fainting with marked pulmonary edema. Phenylphosphine can affect you when breathed in. Exposure can cause nausea, loss of appetite; shaking (tremor), irritation of the eyes and flushed skin.

Long-Term Exposure: Repeated exposure can cause skin rash. Phenylphosphine can damage the blood cells. In animals: blood changes; anemia, testicular degeneration; loss of appetite; diarrhea, lacrimation (discharge of tears), hind leg tremor; dermatitis.

Points of Attack: Blood, CNS; skin, reproductive system.

Medical Surveillance: Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, examination of the nervous system. If skin rash develops see a qualified allergist.

First Aid: *Eyes*: first check the victim for contact lenses and remove if present. Flush victim's eyes with water or normal saline solution for 20 to 30 minutes while simultaneously calling a hospital or poison control center. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin:* immediately flood affected skin with water while removing and isolating all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. Immediately call a hospital or poison control center even if no symptoms (such as redness or irritation) develop. Immediately transport the victim to a hospital for treatment after washing the affected areas. *Inhalation:* immediately leave the contaminated area; take deep breaths of fresh air. Immediately call a physician and be prepared to transport the victim to a hospital even if no symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop. Provide proper respiratory protection to rescuers entering an unknown atmosphere. Whenever possible, SCBA should be used; if not available, use a level of protection greater than or equal to that advised under protective clothing. *Ingestion:* if the victim is conscious and not convulsing, give 1 or 2 glasses of water to dilute the chemical and immediately call a hospital or poison control center. Generally, the induction of vomiting is not recommended outside of a physician's care due to the risk of aspirating the chemical into the victim's lungs. However, if the victim is conscious and not convulsing and if medical help is not readily available, consider the risk of inducing vomiting because of the high toxicity of the chemical ingested. Ipecac syrup or salt water may be used in such an emergency. Immediately transport the victim to a hospital. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body. Do not induce vomiting. Immediately transport the victim to a hospital[101].

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 0.05 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: store under inert gas. Pyrophoric in air, corrosive, reducing agent. (1) Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (2) White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (3) Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in a area isolated from oxidizers and other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2845 Pyrophoric liquids, organic, n.o.s Hazard Class: 4.2, Labels: 4.2-Spontaneously combustible material. Technical Name Required. *Note:* this chemical is also a strong reducing agent.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition (above 200°C) products include hydrogen phosphide and oxides of phosphorus and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS Number: YU1400000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN2767 (phenyl urea pesticides, solid)/151

EC Number: 203-151-2

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Sensitization hazard (skin), Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P093

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: Xn, N, Xi; Risk phrases: R36/38; R43; R51/53; R62; R63; Safety phrases: S28; S36/37-45; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: *N*-phenylthiourea is a colorless crystalline solid. Molecular weight = 152.23; Freezing/Melting point = 148−154°C. Soluble in water.

Potential Exposure: Used as a repellent for rats, rabbits, and weasels; in the manufacture of rodenticides and in medical genetics.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with acids or acid fumes produces toxic fumes of sulfur oxide.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.27 milligram per cubic meter

PAC-2: 3 milligram per cubic meter

PAC-3: 18 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. High exposures can cause lung irritation, coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure may result in vomiting, difficult breathing; noisy breathing; cyanosis, and low body temperature. It is classified as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoon for a 70 kg (150 lb) person.

Long-Term Exposure: Not tested for long-term health effects. May cause methemoglobinemia, cyanosis, and anemia. Phenylthiourea is reported to be similar to ANTU.

Points of Attack: Lungs, skin (possible allergic reaction).

Medical Surveillance. Lung function tests. Blood methemogloblin level. CBC. Consider chest X-ray following acute overexposure. Evaluation by a dermatologist and/or a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2767 Phenyl urea pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust or use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: 202-640-8

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison inhalation hazard, Highly flammable liquid, Violently reactive with water, Corrosive, Primary irritant (w/o allergic reaction).

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 500 lb (227 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F, T+, C, Xn; Risk phrases: R11; R14; R21/22; R26; R34; R35; R36/37/38; Safety phrases: S1; S23; S26; S28; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Phenyl trichlorosilane is a colorless to light yellow liquid. Molecular weight = 211.55; Specific gravity (H_2O:1) = 1.3 @ 25°C; Boiling point = 202°C; Flash point = 80.6°C; 91°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: Phenyl trichlorosilane is used to make silicones for water repellants, insulating resins; heat resistant paints; and as a laboratory reagent.

Incompatibilities: vapor form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. The aqueous solution is higly acidic. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: $\mathbf{0.6_A}$ ppm

PAC-2: $\mathbf{7.3_A}$ ppm

PAC-3: $\mathbf{33_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Eye contact may damage the corneas and cause blindness. Inhalation may cause throat to swell, causing suffocation; and may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Highly toxic; may cause death or permanent injury after short inhalation exposure to small quantity. Chemical burns to all exposed membranes and tissues with severe tissue destruction. *Delayed:* after oral exposure stomach and intestines may perforate to be obstructed by scar tissue. Ingestion may cause mild to moderately severe oral and esophageal burns, with severe burns occurring in stomach. Perforations and peritonitis may occur. Severe irritation may produce spontaneous vomiting. Viscid white or blood-stained foamy mucus and threads of tissue may appear in mouth.

Long-Term Exposure: Many highly irritating substances can cause lung damage; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful. Lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk; then give demulcents, such as milk, cornstarch, and water. Do not induce vomiting.

Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to phenyl trichlorosilane, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water at temperatures below 50°C. Phenyl trichlorosilane can give off corrosive hydrogen chloride gas on contact with water, steam or moisture. Sources of ignition, such as smoking and open flames, are prohibited where Phenyl trichlorosilane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1804 Phenyltrichlorosilane, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

Phenyltrichlorosilane when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.0/1.5

Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal.

Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible and corrosive liquid. Thermal decomposition products may include hydrogen chloride, chlorine and oxides of carbon. *Do not use water or hydrous agents. FOR CHLOROSILANES DO NOT USE WATER. USE AFFF ALCOHOL-RESISTANT, MEDIUM EXPANSION FOAM. Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers.* If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Trichlorophenylsilane, Washington, DC, Chemical Emergency Preparedness Program (November 30, 1987)

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Phenyl Trichlorosilane, Trenton, NJ (May 2000)

Phenytoin P:0510

Formula: $C_{15}H_{12}N_2O_2$

Synonyms: AI3-52498; Aleviatin; Antisacer; Auranile; Causoin; Citrullamon; Citrulliamon; Comital; Comitoina; Convul; Danten; Dantinal; Dantoinal; Dantoinal klinos; Dantoine; Denyl; Didan TDC 250; Difenilhidantoina (Spanish); Difenin; Difhydan; Dihycon; di-Hydan; Dihydantoin; di-Lan; Dilantin acid; Dilantine; Dillantin; Dintion; Diphantoin; Diphedal; Diphenine; Diphentoin; Diphentyn; Diphenylan; 5,5-Diphenylhydantoin; Diphenylhydantoin; 5,5-Diphenylimidazolidin-2,4-dione; 5,5-Diphenyl-2,4-imida zolidinedione; Diphenylhydantoine; di-Phetine; Ditoinate; DPH; EKKO; EKKO Capsules; Enkelfel; Elepsindon; Epamin; Epanutin; Epasmir 5; Epdantoine simple; Epelin; Epilan; Epilantin; Epinat; Epised; Eptal; Eptoin; Fenantoin; Fenidantoin S; Fenitoina; Fenylepsin; Fenytoine; Gerot-epilan-D; Hidan; Hidantilo; Hidantina; Hidantina senosian; Hidantina vitoria; Hidantomin; Hydantoin; Hydantoin, 5,5-diphenyl-; Hydantoinal; Ictalis simple; Idantoin 2,4-imidazolidinedione, 5,5-diphenyl-; Kessodanten; Labopal; Lehydan; Lepitoin; Lepsin; Minetoin; NCI-C55765; Neos-hidantoina; Neosidantoina; Novantoina; OM-hidantoine simple; OM-hydantoine; Oxylan; Phanantin; Phanatine; Phenatine; Phenatoine; Phenitoin; Ritmenal; Saceril; Sanepil; Silantin; Sodanthon; Sodantoin; Solantoin; Sylantoic; Tacosal; Thilophenyl; Toin; Toin unicelles; Zentronal; Zentropil

CAS Registry Number: 57-41-0; 630-93-3 (sodium salt)

HSDB Number: 3160

RTECS Number: MU1050000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 200-328-6; 211-148-2 (phenytoin sodium)

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen (Phenytoin & Phenytoin sodium); IARC: Human Limited Evidence, animal Sufficient Evidence*, possibly carcinogenic to humans*, Group 2B, 1987.

California Proposition 65 Chemical[102]: Cancer 1/1/1988; Reproductive toxin 7/1/1987; Cancer 1/1/1988 (sodium salt).

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Drug.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U098

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 10 lb (4.54 kg)

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T, F, Xn; Risk phrases: R45; R11; R20/21/22; R23/24/25; R36/37/38; R39; R40; R50/53; R61; R62; R63; Safety phrases: S7; S16; S26; S36/37; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Phenytoin is a crystalline compound. Molecular weight = 252.27; Freezing/Melting point = 295−298°C; Ignition temperature = 585°C. Insoluble in water.

Potential Exposure: Phenytoin is an amide pharmaceutical used in the treatment of grand mal epilepsy, Parkinson's syndrome; and in veterinary medicine. Human exposure to phenytoin occurs principally during its use as a drug. Figures on the number of patients using phenytoin are not available, but phenytoin is given to a major segment of those individuals with epilepsy. The oral dose rate is initially 100 mg given 3 times per day and can gradually increase by 100 mg every 2−4 weeks until the desired therapeutic response is obtained. The intravenous dose is 200−350 mg/day.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Similar organic amides react with azo and diazo compounds, releasing toxic gases. Contact with reducing agents can release flammable gases. Amides are very weak bases but they can react as acids, forming salts. Mixing amides with dehydrating agents such as phosphorus pentoxide or thionyl chloride generates the corresponding nitrile[101].

Permissible Exposure Limits in Air:

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure include blurred vision, hyperactivity, confusion, drowsiness, nausea, vomiting, epigastric pain; swelling of gums; fever, liver and kidney damage.

Long-Term Exposure: Phenytoin is carcinogenic in mice after oral administration or by intraperitoneal injection, producing lymphomas and leukemias.

Points of Attack: Liver, kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests.

First Aid: *Skin Contact:* [52] Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place or in a refrigerator. Protection from air, light and moisture is recommended for long-term storage[52]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical

Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25meters/75 feet.(NJ). Isolation Distance, Fire: 800 meters/ 0.5 miles[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources:[52] Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

United States DOT Regulated Marine Pollutant (49CFR172.101, appendix B), severe pollutant

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R27/28; R33; R50/53; R61; R62; R63; Safety phrases: S1/2; S28; S29; S35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Phorate is a clear mobile liquid with a skunk-like odor. Molecular weight = 260.39; Specific gravity (H_2O:1) = 1.16 @ 20°C; Boiling point = 290°C; 118−120°C @ 0.8 mm; Freezing/Melting point = −42.8°C; Vapor pressure = Vapor pressure = 8.4×10^{-4} mmHg @ 25°C; Flash point = 160°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.005%.

Potential Exposure: Those engaged in the manufacture, formulation and application of this systemic and contact insecticide and acaricide. It is also used as a soil insecticide.

Incompatibilities: Water, alkalis. Hydrolyzed in the presence of moisture and by alkalis; may produce toxic oxides of phosphorus and sulfur. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air:

OSHA PEL: None

NIOSH REL: 0.05 milligram per cubic meter TWA; 0.2 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.05 milligram per cubic meter TWA, inhalable fraction and vapor; [skin] not classifiable as a human carcinogen; BEIA issued for Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 0.0036 milligram per cubic meter

PAC-2: $\mathbf{0.040_A}$ milligram per cubic meter

PAC-3: $\mathbf{0.12_A}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Australia: TWA 0.05 milligram per cubic meter; STEL 0.2 milligram per cubic meter, [skin], 1993; Belgium: TWA 0.05 milligram per cubic meter, [skin], 1993; Denmark: TWA 0.05 milligram per cubic meter, [skin], 1999; France: VME 0.05 milligram per cubic meter, [skin], 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; Switzerland: MAK-W 0.05 milligram per cubic meter, [skin], 1999; United Kingdom: TWA 0.05 milligram per cubic meter; STEL 0.2 milligram per cubic meter, [skin], 2000; the Netherlands: MAC-TGG 0.05 milligram per cubic meter, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 0.2 milligram per cubic meter [skin]. Several states have set guidelines or standards for Phorate in ambient air[60] ranging from 0.5−2.0 μ/m^3 (North Dakota) to 0.8 μ/m^3 (Virginia) to 1.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides.

Permissible Concentration in Water: Maine[61] has set a guideline for phorate in drinking water of 0.2 μg/L.

Determination in Water: Fish Tox = 0.13505000 ppb (EXTRA HIGH). Octanol-water coefficient: Log K_{ow} = > 3.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Acute exposure to phorate may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Dyspnea (shortness of breath) may be followed by respiratory collapse. Giddiness is common. This material is one of the more toxic organophosphorus insecticides. It is a cholinesterase inhibitor that acts on the nervous system; and produces toxicity similar to parathion. The probable oral lethal dose for humans is less than 5 mg/kg, i.e., a taste (less than 7 drops) for a 70 kg (150 lb) person. LD_{50} = (oral-rat) 37 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure; resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 3.50000 ppm (HIGH).

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Not available according to NIOSH. *The following is included for reference:* NIOSH: *(parathion) 0.5 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *10 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and alkalis. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200

Then: Protect persons downwind (miles/kilometers)

Day 1.4/2.3

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of phosphorus, sulfur and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Wear positive pressure SCBA. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Phorate, Trenton, NJ (September 2001).

Phosacetim P:0530

Formula: $C_{14}H_{13}Cl_2N_2O_2PS$

Synonyms: Acetimidoylphosphoramidothioic acid *O*,*O*-bis(*p*-chlorophenyl) ester; BAY 33819; Bayer 33819; *O*,*O*-Bis(*p*-chlorophenyl) acetimidoyl phosphoramidothioate; *O*,*O*-Bis(4-chlorophenyl) *N*-acetimidoyl phosphoramidothioate; *O*,*O*-Bis(4-chlorophenyl) 1-iminoethyl phosphoramidothioate; *O*,*O*-Bis(4-chlorophenyl)-1-iminoethylphosphoramidothioic acid; DRC-714; Gophacide; (1-Iminoethyl)phosphoramidothioic acid, *O*,*O*-bis(4-chlorophenyl) ester; Phosazetim; Phosphonodithio-imidocarbonic acid, acetimidoyl-, *O*,*O*-bis(*p*-chlorophenyl) ester; Phosphonodithioimidocarbonic acid, (1-iminoethyl)-, *O*,*O*-bis(*p*-chlorophenyl) ester

CAS Registry Number: 4104-14-7

HSDB Number: 6436

RTECS Number: TB4725000

UN/NA & ERG Number: (PIH) UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 223-874-7 [*Annex I Index No.:* 015-092-00-8]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Neurotoxin (cumulative), Combustible, Agricultural chemical, Environmental hazard.

Banned or Severely Restricted (Germany, Philippines) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R27/28; R33; R50/53; Safety phrases: S1/2; S28; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Phosacetim is a crystalline solid. Molecular weight = 375.22. Hazard Identification (based on NFPA-704 M Rating System): Health 4 Flammability 1, Reactivity 0.

Potential Exposure: Used as a rodenticide.

Incompatibilities:Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrates. May hydrolyze on contact with moisture.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.34 milligram per cubic meter

PAC-2: 3.7 milligram per cubic meter

PAC-3: 11 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. May be fatal if swallowed or by skin contact. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Highly toxic. LD_{50} oral rat is 3.7 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure; resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase

with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of phosphorus, sulfur, nitrogen and carbon. This chemical is a flammable solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Neurotoxin (cumulative), Combustible, Highly Toxic, Environmental hazard, Sensitization hazard (skin), Agricultural chemical

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N, Xi; Risk phrases: R27/28; R33; R43; R51/53; Safety phrases: S1/2; S29; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: Phosfolan is a colorless to yellow solid. Molecular weight = 255.31; Boiling point = 115−118°C @ 0.001 mm; Freezing/Melting point = 37−45°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: An organophosphate, A potential danger to those involved in the manufacture, formulation and application of this insecticide.

Incompatibilities: Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101] Incompatible with nitrates and water. May hydrolyze upon contact with water, steam and moisture, and produce toxic oxides of phosphorus, nitrogen, sulfur, and chlorine.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.82 milligram per cubic meter

PAC-2: 9 milligram per cubic meter

PAC-3: 54 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Similar to parathion in health hazards. Death may result due to respiratory arrest as a result of paralysis of respiratory muscles and intense bronchoconstriction. Also considered a cholinesterase inhibitor. Symptoms similar to parathion include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; headache, giddiness, dizziness, tightness in the chest; blurring or dimness of vision; tearing, loss of muscle coordination; slurring of speech; twitching of muscles; drowsiness, difficulty in breathing; respiratory rales; and random jerky movements.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause skin allergy.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Evaluation by a dermatologist and/or qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code -Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, nitrates and other incompatible materials listed above. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3464 Organophosphorus compound, solid, toxic, n.o.s, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. Extinguish with dry chemical, carbon dioxide; water spray, foam, or fog. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. Hazard Symbols, Risk & Safety statements: Hazard Symbol *(75-44-5)*: T+, C, N, Xi, Xn; Risk phrases: R5; R21; R26; R34; R36/37/38; R39/26; Safety phrases: S1/2; S9; S26; S29/35; S33; S36/37/39; S38; S41, S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Phosgene (CG) is a colorless gas above 8.2°C. Fog-like when concentrated. Colorless, fuming liquid below 8.2°C. May have the appearance of a white cloud. Light yellow liquid when refrigerated or compressed. It is shipped as a liquefied compressed gas in steel cylinders. At low concentrations CG has a sweet (not pleasant) odor like newly mown hay, green corn, or moldy hay. In higher concentrations, it is poisonous with an odor that is suffocating, irritating, and pungent. The odor is only detectable for a short amount of time when CG is initially released and odor should not be regarded as a reliable indicator of overexposure. A fuming liquid below 8.3°C/47°F. Shipped as a liquefied compressed gas. The Odor Threshold is between 1.5−6 milligram per cubic meter. A choking agent, phosgene (CG) rapidly decompose in relative humidity over 70%. Molecular weight = 98.92; Specific gravity (H_2O:1) = 1.4 @ 20°C; Boiling point = 8.2°C; Freezing/Melting point = −128°C; Relative vapor density (air = 1) = 3.48; Vapor pressure = 1.61 atm @ 25°C; 750 mmHg @ 7.2°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 1. ₩ Slightly soluble in water; reacts with water forming hydrogen chloride acid and oxides of carbon.

Potential Exposure: Phosgene can be deadly at a concentration as low as 2 ppm. Phosgene is used as an intermediate in the manufacture of many industrial chemicals, including dyes and plastics; in the making of dyestuffs based on triphenylmethane, coal tar, and urea. It is also used in the organic synthesis of isocyanates and their derivatives, carbonic acid esters (polycarbonates); and acid chlorides. Other applications include its utilization in metallurgy; and in the manufacture of some insecticides and pharmaceuticals. Exposure to phosgene may occur during arc welding and in fires involving vinyl chloride; released from household paint removers and degreasers when they are used in the presence of heat. Phosgene (CG) has been used as a military choking, pulmonary agent since WW I, and has become a staple of chemical arsenals in many countries.

Persistence of Chemical Agent: Phosgene (CG & DO): Summer: 1to 10 minutes; Winter: 10 minutes to 1 hour.

Incompatibilities: Moisture, alkalis, ammonia, alcohols, copper. Reacts slowly in water to form corrosive hydrogen chloride and carbon dioxide. Violent reaction with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alcohols, alkaline materials, strong acids, strong bases, alcohols, ammonia, amines, aluminum, alkali metals. Attacks many metals in presence of water. Phosgene (CG) reacts violently with strong oxidants, amines, alkalis, and many metals. Above 300°C, phosgene decomposes in the presence of moisture to form hydrochloric acid and carbon dioxide. In the presence of moisture, phosgene attacks plastic, rubber, coatings and many metals[77].

Permissible Exposure Limits in Air:

NIOSH IDLH = 2 ppm

Conversion factor: 1 ppm = 4.05 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.1 ppm/0.4 milligram per cubic meter TWA

NIOSH REL: 0.1 ppm/0.4 milligram per cubic meter TWA; 0.2 ppm/0.8 milligram per cubic meter [15-min.] Ceiling Concentration

ACGIH TLV[1]: 0.1 ppm/0.4 milligram per cubic meter TWA

Protective Action Criteria (PAC) **CG*** Ver. 29[138]

PAC-1: 0.027 ppm

PAC-2: $\mathbf{0.3_A}$ ppm

PAC-3: $\mathbf{0.75_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Emergency Response Planning Guidelines

ERPG-1: Inappropriate

ERPG-2: 0.2 ppm

ERPG-3: 1 ppm

DFG MAK: 0.02 ppm; 0.082 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group C

Austria: MAK 0.1 ppm (0.4 milligram per cubic meter), 1999; Denmark: TWA 0.05 ppm (0.2 milligram per cubic meter), 1999; Finland: STEL 0.05 ppm (0.2 milligram per cubic meter), [skin], 1999; France: VLE 0.1 ppm (0.4 milligram per cubic meter), 1999; Japan: 0.1 ppm (0.4 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.08 milligram per cubic meter, 2003; the Phillipines: TWA 0.1 ppm (0.1 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter; MAC (STEL) 1.5 milligram per cubic meter, 1999; Sweden: TGV 0.05 ppm (0.2 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (0.4 milligram per cubic meter), KZG-W 0.2 ppm (0.8 milligram per cubic meter), 1999; Thailand: TWA 0.1 ppm (0.4 milligram per cubic meter), 1993; Turkey: TWA 0.1 ppm (0.4 milligram per cubic meter), 1993; United Kingdom: TWA 0.02 ppm (0.08 milligram per cubic meter); STEL 0.06 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 ppm. The Czech Republic has set a TWA of 0.5 milligram per cubic meter and a ceiling value of 1.0 milligram per cubic meter in workplace air, and MAC in ambient air of 0.01 milligram per cubic meter and 0.003 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for phosgene in ambient air[60] ranging from zero (North Carolina) to 1.33 μ/m^3 (New York) to 4.0 μ/m^3 (Florida, North Dakota, South Carolina) to 7.0 μ/m^3 (Virginia) to 8.0 μ/m^3 (Connecticut) to 10.0 μ/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method 61.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.71$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can be fatal if inhaled. Acute exposure to phosgene may result in severe irritation and burns of the skin, eyes, mucous membranes; and respiratory passages. Cough, dyspnea (shortness of breath), pain in the chest; and severe pulmonary edema may also occur. Cyanosis and anxiety may be observed. *Note:* The detection of the odor of phosgene at any time indicates the need for immediate, corrective action or withdrawal. *Inhalation:* Both immediate and delayed symptoms may be felt. Immediate symptoms of irritation to mouth, throat, and eyes; tearing, coughing, and difficult breathing are felt at levels of 5 ppm and above. Delayed effects are the accumulation of fluid in the lungs and death; if proper, rapid treatment is not obtained. The length of delay depends on the dose but may be between 2 and 15 hours. Death may result from short exposures to high levels (30 ppm, 17 minutes) or long exposures to low levels (3 ppm, 3 hours). Phosgene is particularly dangerous at low levels because lethal doses may be inhaled without warning symptoms. *Skin:* Contact with skin may lead to severe chemical burns. Liquid may cause frostbite. *Eyes:* Eye irritation begins @ 3−5 ppm. Severe and permanent damage may result. Liquid phosgene is more hazardous than vapor. Liquid may cause frostbite. *Ingestion:* Expected symptoms may include severe irritation and chemical burns of the mouth, throat, lungs and digestive tract.

Long-Term Exposure: Even low levels can cause permanent lung damage; emphysema, bronchitis, pulmonary fibrosis.

Points of Attack: Respiratory system, lungs, skin, eyes.

Medical Surveillance: Preemployment medical examinations should include chest X-rays and baseline pulmonary function tests. Consider chest X-ray following acute overexposure. The eyes and skin should be examined. Smoking history should be known. Periodic pulmonary function studies should be done. Workers who are known to have inhaled phosgene should remain under medical observation for at least 24 hours to insure that delayed symptoms do not occur.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately. If this chemical contacts the skin, flush with water immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Decontamination*:* Decontaminate as soon as possible. This is extremely important. If you don't have the equipment (TMV-4) has enter the hot zone to rescue and/or decontaminate victims. If the victim can't move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Wash—strip—wash—evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and up hill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but don't let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 minutes. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece scba operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a non-encapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical -resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Where liquid phosgene is encountered, protective clothing should be supplied which is impervious to phosgene. Where gas is encountered above safe limits, Full-face gas masks with phosgene canisters or supplied air respirators should be used. Because of the potentially serious consequences of acute overexposure and the poor warning properties of the gas to the human senses, automatic continuous monitors with alarm systems are strongly recommended. Wear appropriate clothing to prevent any reasonable probability of skin or eye contact. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Decontamination: Decontaminate as soon as possible. This is extremely important. If you don't have the equipment and training, don't enter the hot zone to rescue and/or decontaminate victims. If the victim can't move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Wash—strip—wash—evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and up hill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but don't let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 minutes. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident

Respirator Selection: *1 ppm:* Sa (APF = 10) (any supplied-air respirator). *2 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Phosgene must be stored to avoid contact with water, moisture, or steam, since violent reactions occur. Store in tightly closed, steel containers in an isolated area away from the work area and separated from all other materials, as well as sunlight. Although phosgene in anhydrous equipment is not corrosive to ordinary metals; in presence of moisture, use monel, tantalum, or glass-lined storage containers. Phosgene should be stored away from heating and cooling ducts. Containers should be frequently inspected for leaks. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1076 Phosgene, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation, Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Phosgene

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.7/2.7

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 1.9/3.1
Night 6.7/10.8

Diphosgene

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

CG, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 2.0/3.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 4.7/7.5
Night 7.0+/11.0+*

*+ means distance can be larger in certain atmospheric conditions.

DP, when used as a weapon

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.3
Night 0.4/0.8
Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 1.5/2.4

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Phosgene may be neutralized by covering it with sodium bicarbonate or an equal mixture of soda ash and slaked lime; diatomite and expanded mica might also be used. After that cover immediately abundant with lime hydrate. After mixing, spray very carefully with water. Transfer slowly to a larger container of water. *Do not use water* directly on spill. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of carbon. Phosgene may burn, but does not easily ignite. This gas is under pressure; containers may rupture and explode when heated. For small fires, use dry chemical or carbon dioxide. Use water spray, fog, or foam for larger fires. Move container from fire area if you can do so without risk. Stay away from the ends of tanks and cool exposed containers with water until well after the fire is out. Isolate the area until gas has dispersed. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. Diphosgene (DP) will not burn. However, it is possible that a DP tank may be adjacent to a fire. In a fire, a storage tank will heat and the tank may over-pressurize and explode, so evacuate the area. When heated, DP breaks down to toxic phosgene, which breaks down into chlorine and hydrogen chloride gases. The danger from a heated DP tank is too great to risk a manned firefighting effort; if possible, an unattended fire monitor aimed at the upper part of the diphosgene tank will cool the tank and may prevent tank failure. In general, it's best to use a spray or fog pattern rather than a solid stream, to avoid spreading the burning fuel around.

Disposal Method Suggested: Principles and methods for destruction of chemical weapons: "Destruction of chemical weapons" means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each nation shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each nation shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention (Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction). Return refillable compressed gas cylinders to supplier. Phosgene may be neutralized by covering it with sodium bicarbonate or an equal mixture of soda ash and slaked lime. After mixing, spray carefully with water. Transfer slowly to a larger container of water. *Do not use water* directly on spill. Pass controlled discharges of phosgene through 10% NaOH solution in a scrubbing tower [22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Phosgene Oxime (Agent CX) P:0555

Formula: $CHCl_2NO$

Synonyms: Carbonyl chloride oxime; CX; Dichlorformaldehyde-oxime; Dichloroformaldoxime; 1,2-Dichloroformoxime Dichloroformoxime; Dichlormethylen-hydroxylamine; Dichloroximinomethane; Kohlensauredichloridoxime (German)

CAS Registry Number: 1794-86-1

HSDB Number: 7600

RTECS Number: Not established

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; 2810 (liquid)/154

Regulatory Authority and Advisory Information

Report any release of WMD to National Response Center 1-800-424-8802

Hazard Alert: Poison, Blister agent/vesicant, Median incapacitatingand lethal dose is low, May be an oxidizer.

While not a mandated "Federally-listed" waste, CX is more toxic than most RCRA listed chemicals. However, GF is a "listed" hazardous waste in some states where it may have been stockpiled by the military.

Description: Phosgene oxime (military designation CX) is a non-combustible urticant (nettle agent, blister agent) with a short (seconds to minutes) latency period. CX is a colorless, low-melting point (crystalline, white powder) solid or as a liquid (liquid above 39°C; solid below 35°C). On hot days (or at body temperature) it can appear as a yellowish-brown liquid. It has a high vapor pressure (the vapor pressure of the solid is high enough to produce symptoms), slowly decomposes at normal temperatures. It has an intense, disagreeable,penetrating, and violently irritating, peppery odor. Odor detectable at less than 0.3 ppm. Molecular weight = 113.93 daltons; Freezing/Melting point = 35°C to 40°C; boiling point = 129°C (with decomposition); Vapor density = 3.9; Vapor pressure = 11.2 mmHg @ 20°C (solid); 13 mmHg @40°C (liquid); Volatility = 1800 milligram per cubic meter @20°C; 76,000 milligram per cubic meter @ 40°C; Latent heat of vaporization = 101 cal/gr @ 40°C; Thermal decomposition temperature = < 128°C. Solubilty in water = dissolves slowly and completely. Hydrolysis products include hydrogen chloride and methylarsenic oxide.

History of the chemical: CX was invented in Germany in 1929; it is among the least well studied chemical warfare agents; therefore, detailed information is limited. Although it is believed that CX was never used on the battlefield, it was after WW II that the military tested concentrated phosgene oxime. These tests revealed that CX was a highly effective and painful chemical warfare agent. Phosgene oxime is of military interest because it easily penetrates garments and rubber much more quickly than do other chemical agents. It is possible that the Iraq is used CX in the Iran-Iraq war, and North Korea may have produced and stocked quantities of this chemical agent. Phosgene oxime (CX) gives off dangerous gas. It does takes very little of this gas to damage a victim's lungs. Terrorists might put CX in it an exploding bomb in order break up the solid into an aerosol that can penetrate the skin and lungs. Once exposed, the victim's feels immediate pain and the need to escape. Phosgene oxime (CX) easily penetrates fabrics and rubbers and cause great pain and skin damage (without blisters) in less than a minute. Soon after contact the skin dies. Recovery may take up to 6 months. Eye contact can cause blindness. Inhalation attacks the lungs, resulting in damage that can be permanent.

Potential Exposure: There's no industrial use for Phosgene oxime (CX) and because of its extreme instability, the pure material is not likely to be used in military operations[163]. CX is especially dangerous when mixed with other chemicals such as nerve agents. It burns away the skin making it more permeable to any other "added" agents. No other chemical agent is capable of producing immediate extreme pain followed by rapid local tissue death (necrosis). Post World War II studies indicate that concentrations below 8% cause no or inconsistent effects[76].

Persistence of Chemical Agent*: Soil*: about 2 hours. *Material surfaces and water*: relatively nonpersistent.

Incompatibilities: Phosgene oxime (CX) is among the most important halogenated oximes. CX reacts with water, sweat, and heat, forming hydrochloric acid. CX may be an oxidizer, and it may ignite combustibles, e.g., wood, paper, oil, or clothing). CX is incompatible with strong acids and bases; hydrides and other strong reducing agents such as hydrides; strong oxidizing acids, peroxides, and hydroperoxides. Not hydrolyzed by dilute acids; reacts violently in basic solutions forming carbon dioxide, hydrogen chloride, and hydroxylamine. Hydrolysis products include HCl and methylarsenic oxide. CX quickly penetrates rubber and clothing. Traces of many metals cause it to decompose; however, it corrodes most metals. Oximes are chemically similar to, but more reactive than amides. Incompatible with strong acids and bases, and especially incompatible with strong reducing agents such as hydrideds and active metals. Also incompatible with strongly oxidizing acids, peroxides, and hydroperoxides[101]. CX decomposes when in contact with many metals; it is corrosive to most metals, and contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air: Conversion factor = 1 ppm = 4.66 milligram per cubic meter @77°C

The immediately-dangerous-to-life-and-health (IDLH) concentration of CX has not been defined.

Protective Action Criteria (PAC) **CG*** Ver. 29[138]

PAC-1: $\mathbf{0.028_A}$ milligram per cubic meter
PAC-2: $\mathbf{0.083_A}$ milligram per cubic meter
PAC-3: $\mathbf{13_A}$ milligram per cubic meter
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Air:
Medial lethal dose = low ~3000 mg-min/m^3.
According to the United States Army Medical Research Institute of Chemical Defense (*USAMRICD), do NOT depend on the following for the detection of Agent CX*: M272 water testing kit, MINICAMS, ICAD, M21 remote sensing alarm, CAM, ACAMS, DAAMS, and M8A1 automatic chemical-agent detector alarm are incapable of detecting CX. Likewise, M8 and M9 paper should not be depended upon to detect Agent CX.

The M256A1 detector ticket reacts to the presence of CX, but the detection threshold is not known with certainty. Liquid detection: The portable M256A1 has a response time of up to 15 minutes. The following detectors are listed for Agent CX detection in the *Guide for the Selection of Chemical Detection Equipment for Emergency First Responders, 3rd Edition*, published by the United States Department of Homeland Security: Chemical Agent Detector C2 Kit (021330) for vapor, liquids, aerosols: Start-up time (based on experience) 1 to 5 minutes; response time (regardless of experience) 20−25 minutes (Anachemia Canada, Inc.); and M256A1 (T503) (063230COM) Chemical Agent Detector Simulator Training Kits for vapor only: Start-up time (based on experience) 1 to 5 minutes; response time (regardless of experience) 20−25 minutes (Anachemia Canada, Inc.)

The following detectors have the capacity to detect CX at the threshold limits given[191]:
Liquid: M18A2.0.5 milligram per cubic meter
Air: M90 (M90-D1-C).0.15 milligram per cubic meter
M93A1 Fox.10-100 mcg/L

Permissible Concentration in Water: Do NOT use the M272 water testing kit[191].

Determination in Water: Contact pollution control authorities and advise shutting water intakes. CX dissolves in water and breaks down into toxic products that are much less dangerous than phosgene oxime, but still poisonous. Do not allow people to drink water containing even the breakdown products.

Routes of Entry: Skin, eye contact, inhalation

Harmful Effects and Symptoms
Phosgene oxime (CX) is a rapid-acting casualty agent. Median lethal dose = ~3000 mg-min/m^3. The effects of phosgene oxime vapor and liquid on the skin, eyes, and lungs are almost instantaneous; causing immediate pain upon contact with the liquid and when the vapors are inhaled. Little is known about how CX works but it eats its way through protective clothing, the skin, and eventually reaches the blood. Phosgene oxime (CX) will cause blindness; kill skin horribly, and with enough of it on the skin a victim could die. *Eyes*: The eyes will immediately burn; the eyelids will swell, and the victim's cornea will scar, causing permanent damage to the eyes with possible blindness. *Lungs*: The effects are immediate: The victim will sneeze and cough, with runny nose. The lungs will fill with fluid causing pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin*: Immediate stinging pain will be felt. The skin reddens and will eventually blister (up to 12 hours after exposure). *Ingestion*: It's difficult to understand how one might swallow Phosgene oxime (CX), but it possibly may happen. Animal studies show that the victim's stomach and intestines would swell and bleed.

Short-Term Exposure: Pain and local tissue destruction occur immediately on contact with skin, eyes and mucous membranes. Phosgene oxime is rapidly absorbed from the skin and eyes and may result in systemic toxicity. Phosgene oxime causes redness, wheals (hives), and urticaria on the skin, but does not producea fluid-filled blister (vesication). Despite the lack of initial blister formation, phosgene oxime produces moretissuedamage than the blister agents. Known as a "nettle gas," CX produces immediate pain varying from a mild pricklingto almost intolerable pain similar to a severe bee sting. Phosgene oxime has no antidote. Treatment is similar to that ofthe mustard agents. It causes violent irritation to the mucous membranes of the nose and eyes. Even at low temperatureit has sufficient vapor pressure to produce tearing. When CX comes in contact to the skin, the area turns pale in 30 seconds and develops a red ring around the area. A wheal forms in about 30 minutes; the blanched area turns brown in24 hours and a scab forms in about a week. The scab usually falls off in about 3 weeks. Itching may be presentthroughout healing, which in some cases may be delayed beyond 2 months. [Army FM 3-9 and CDC] The LD$_{50}$ for skin exposure is estimated as 25 mg/kg. LCt$_{50}$ = no accurate data available; The estimated LCt$_{50}$ by inhalation is 1500−2000 mg · min/m^3; ICt$_{50}$ (respiratory) 25 mg-minute/m^3 Inhaled phosgene oxime is extremely irritating to the upper airways and causes pulmonary edema. Irritation occurs with exposures to 0.2 mg-min/m^3 and becomes unbearable at 3 mg-min/m^3. The estimated LCt$_{50}$ (the product of concentration times time that is lethal to 50% of the exposed population by inhalation) is 1500 to 2000 mg-min/m^3[76].

Long-Term Exposure: May cause permanent injury, including lung damage and blindness. Information is unavailable about the carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to phosgene oxime.

Points of Attack: Skin; mucous membranes of the nose and eyes.

Medical Surveillance: There are no specific tests to confirm exposure. Extreme pain may persist for days. Patients/victims should be observed for signs of whole-body (systemic) toxicity, including accumulation of fluid in the lungs (pulmonary edema). Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway[77].

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Decontamiation: *Note to first responders*: Depending on the dose and the equipment available to you: Evacuate the area and shut down heating, ventilation, and air conditioning systems to prevent further spread of Phosgene oxime (CX). Call for medical and hazmat assistance immediately. If you get CX on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. Because of the rapid reaction of CX with the skin, decontamination may not be entirely effective once pain occurs. Nevertheless, decontaminate as rapidly as possible by flushing the area with large amounts of water to remove any agent that has not reacted with the skin. Wash the victim with warm water with soap. *Bleach doesn't work with CX.* Be certain you've decontaminated the victims as much as you can before they leave the area so that theydon't spread the Phosgene oxime (CX).

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2.

A NIOSH-certified CBRN full-facepiece scba operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents.

Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a non-encapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. *CX quickly penetrates rubber and clothing.* Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a non-encapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

Storage: Used detection equipment prior to entering storage area. *See above section: Determination in Air.* Poison gas. (1) Color code-Blue: Health Hazard/Poison: Store in a locked and secure poison location. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. Containers should be frequently inspected for leaks. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101.

Shipping: UN2811 (solid)/UN2810 (liquid) Toxic solids or liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.8/4.5

CX, when used as a weapon

Small spills [involving the release of approximately 52.83 gallons (200 liters) or less]

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills [*involving quantities greater than 52.83 gallons (200 liters)*]

First: Isolate in all directions (feet/meters) 300/90
Then: Protect persons downwind (miles/kilometers)
Day 0.6/1.0
Night 1.9/3.1

If a tank, rail car, or tank truck is involved in a fire, isolate it for 0.5 mi (800 m) in all directions; also, consider initial evacuation for 0.5 mi (800 m) in all directions.

Immediately evacuate everyone, including yourself. Immediately call for medical and hazmat assistance. Notify police, federal authorities, medical, hazmat, and emergency authorities. Immediately decontaminate victim. Don't touch the victim or allow Phosgene oxime (CX) to touch your skin or eyes. If possible, ventilate the area. If response personnel must walk through the spilled agent, wear the appropriate Level A protection. Keep combustibles, for example, wood, paper, and oil, away from the spilled agent. Use water spray to reduce aerosols or divert aerosol cloud drift. Avoid allowing water runoff to contact the spilled agent. Do not direct water at the spill or the source of the leak. Stop the leak if it is possible to do so without risk to personnel. Prevent entry into waterways, sewers, basements, or confined areas. Isolate the area until aerosol has dispersed[77].

Fire Extinguishing: Phosgene oxime (CX) is non-combuatible; it burns weakly, if at all. Thermal decomposition products of CX may include hydrogen chloride, chlorine and oxides of nitrogen and carbon. Containers may explode when heated. In case of fire, evacuate the area, including yourself. CX may be an oxidizer, and it may ignite combustible materials, for example, wood, paper, oil, or clothing. If there is some reason that you have to put out the fire—for example, there are things nearby that cannot be allowed to burn—use unattended equipment, then evacuate everyone immediately, including yourself. If you *must* extinguish a Phosgene oxime(CX) fire, use water streams, water fog, alcohol foam, universal foam, and, for confined fires, carbon dioxide. (For small fires, use dry chemical, carbon dioxide, or water spray. For large fires, use dry chemical, carbon dioxide, alcohol-resistant foam, or water spray.) Vapors are heavier than air and will collect in low areas. Keep out of these areas; stay upwind. Hazardous concentrations may spread along the ground and collect and stay in poorly ventilated, low-lying, or confined areas, for example, sewers, basements, and tanks. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Move containers from the fire area if it is possible to do so without risk to personnel. Dike fire control water for later disposal; do not scatter the material. For fire involving tanks or car/trailer loads, fight the fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tanks. Always stay away from tanks engulfed in fire. Run-off from fire control or dilution water may be corrosive and/or toxic, and it may cause pollution. If the situation allows, control and properly dispose of run-off (effluent).

Disposal Method Suggested

Seek expert advice from armed services (see Reference section), Center for Disease Control headquarters in Atlanta, Ga.

EC Number: 211-987-4 [*Annex I Index No.:* 015-101-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Possible cumulative neurotoxin, Combustible, Water reactive, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (not listed in Annex I, but the following may apply): Hazard Symbol: T+, N; Risk phrases: R21/22; R25; R33; R50/53; R62; R63; Safety phrases: S2; S22; S29, S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Phosmet is a white crystalline solid. Molecular weight = 317.33; Boiling point = (decomposes below BP) >100°C; Freezing/Melting point = 72°C.Hazard; Vapor pressure = 4.9×10^{-7} mbar @ 20°C. Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2₩. Slightly soluble in water, releases phthalic acid.

Potential Exposure: An organophosphorus insecticide and acaricide.

Incompatibilities: Organothiophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101]. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Not compatible with other pesticides under alkaline conditions. Contact with water, steam or moisture forms phthalic acids. Slightly corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.049 milligram per cubic meter

PAC-2: 0.54 milligram per cubic meter

PAC-3: 77 milligram per cubic meter

Russia has set a ceiling value in workplace air of 0.3 milligram per cubic meter. Russia has also set a MAC in ambient air in residential area of 0.009 milligram per cubic meter on a once-daily basis and 0.004 milligram per cubic meter on an average daily basis.

Determination in Air: NIOSH Analytical Method (IV) Method #5600, Organophosphorus pesticides.

Permissible Concentration in Water: Russia[36] set a MAC in surface water of 0.2 mg/L.

Determination in Water: Fish Tox: 4.41815000 ppb MATC (HIGH). Octanol-water coefficient: Log $K_{ow} = 2.8$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin on contact. This material is a highly toxic organophosphate; the probable oral lethal dose for humans is 50−500 mg/kg, or between 1 teaspoon and 1 oz for a 150 lb person. It is a cholinesterase inhibitor and has CNS effects. Oral lethal doses in humans have been reported @ 50 mg/kg. Acute exposure to phosmet may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Dyspnea (shortness of breath) may be followed by respiratory collapse. Giddiness is common.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 7.00000 ppm Health Advisory (HIGH)

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Liver function tests. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and/or slurry of activated charcoal in water; and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to a health care facility.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from other pesticide, alkaline conditions, water and other forms of moisture. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. As for other organophosphorus pesticides stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material. Use water spray to reduce vapors. Take up *small spills* with sand or other noncombustible absorbent material and place in containers for later disposal. Take up small, dry spills with clean shovel and place in clean, dry container. Dike far ahead of *large spills* for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. *For small fires*, use dry chemical, carbon dioxide; water spray; or foam. *For large fires*, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Small amounts may be decomposed with hypochlorite. For large amounts, incineration with effective gas scrubbing is recommended[22].

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, N; Risk phrases: R24; R28; R33; R40; R50/53; R62; R63; R68; Safety phrases: S1/2; S23; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water (CAS: 13171-21-6).

Description: Phosphamidon is a pale yellow oily liquid. Molecular weight = 299.72; Specific gravity (H_2O:1) = 1.22; Boiling point = 162°C @ 1.5 mmHg; Freezing/Melting point = −45°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This material is used as an insecticide on citrus, cotton, and deciduous fruit and nuts. It is also an acaricide.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials. Attacks metals, such as aluminum, iron, tin.

Permissible Exposure Limits in Air:

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.027 milligram per cubic meter

PAC-2: 0.3 milligram per cubic meter

PAC-3: 21 milligram per cubic meter

Determination in Water: Fish Tox = 1445.67277000 ppb (EXTRA LOW); FISH STV (Sediment Toxicity Value): LOW; Octanol-water coefficient: Log $K_{ow} = < 0.9$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes. May affect the nervous system; causing convulsions, respiratory failure and death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. This material is extremely toxic; the probable oral lethal dose for humans is 5−50 mg/kg, or between 7 drops and 1 teaspoonful for a 150 lb person. It is a cholinesterase inhibitor. Acute exposure to phosphamidon may produce pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory effects include dyspnea (shortness of breath), respiratory depression; and respiratory paralysis. Psychosis may occur.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 0.14000 pph (EXTRA HIGH).

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain autorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to a health care facility. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administeringa drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from alkalies.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Organophosphorus compounds

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. Thermal decomposition products may include hydrogen chloride and oxides of phosphorus, nitrogen and carbon. *For small fires*: use dry chemical, carbon dioxide; water spray; or foam. *For large fires:* use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small quantities may be treated with alkali followed by landfill disposal. Large quantities should be incinerated with effluent gas scrubbing[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: F+, T+, N; Risk phrases: R5; R12; R17; R21; R26; R33; R34; R44; R51; R62; Safety phrases: S1/2; S9; S28; S29/35; S33; S36/37; S38; S41; S45; S61; S63 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Phosphine is a colorless gas that is shipped as liquefied compressed gas. Odorless when pure. It has the odor of garlic or the foul odor of decaying fish. The level at which humans detect the odor of phosphine (odor threshold) does not provide sufficient warning of dangerous concentrations. Phosphine presents an additional hazard in that it ignites at very low temperatures. Shipped as a liquefied compressed gas. The pure compound is odorless. The Odor Threshold is 0.14 ppm. Molecular weight = 34.00; Specific gravity (H_2O:1) = 1.4 @ 20°C; Boiling point = −88°C; Freezing/Melting point = −134°C; Relative vapor density (air = 1): 1.18; Vapor pressure = 41.3 atm; >750 mmHg@ −88°C; Flash point = (flammable gas) 104°C; Autoignition temperature (depends on concentration and diluent) = 38−100°C. Explosive limits: LEL = 1.8%; UEL: unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2. Slightly soluble in water; solubility = 25 mL/100 mL @ 17°C.

Potential Exposure: Phosphine is used as a fumigant; in the semiconductor industry, as a doping agent for electronic components to introduce phosphorus into silicon crystals; in chemical synthesis; used as a polymerization initiator; as an intermediate for some flame retardants. Also, exposures may occur when acid or water comes in contact with metallic phosphides (aluminum phosphide, calcium phosphide). These two phosphides are used as insecticides or rodenticides for grain, and phosphine is generated during grain fumigation. When phosphine toxicity is suspected, but phosphine exposure is not obvious, one should suspect transdermal contamination and/or ingestion of phosphides. Phosphine may also evolve during the generation of acetylene from impure calcium carbide, as well as during metal shaving; sulfuric acid tank cleaning; rustproofing, ferrosilicon, phosphoric acid; and yellow phosphorus explosive handling.

Incompatibilities: Phosphine reacts with acids, air, copper, moisture, oxidizers, oxygen, chlorine, nitrogen oxides; metal nitrates; halogens, halogenated hydrocarbons; copper and many other substances, causing fire and explosion hazard. Extremely explosive; may ignite spontaneously on contact with air at (or about) 100°C. Attacks many metals. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, amines, ammonia, ethylene oxide, metal nitrates, nitrous acid, phosgene, strong bases.

Permissible Exposure Limits in Air:

NIOSH IDLH = 50 ppm

Odor threshold = The level at which humans detect the odor of phosphine does not provide sufficient warning of dangerous concentrations.

Conversion factor: 1 ppm = 1.39 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.3 ppm/0.4 milligram per cubic meter TWA

NIOSH REL: 0.3 ppm/0.4 milligram per cubic meter TWA; 1 ppm/1 milligram per cubic meter STEL

ACGIH TLV[1]: 0.3 ppm/0.42 milligram per cubic meter TWA; 1 ppm/1.4 milligram per cubic meter STEL

DFG MAK: 0.1 ppm/0.14 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C

Protective Action Criteria (PAC) Phosphine* Ver. 29[138]

PAC-1: 1 ppm

PAC-2: **2.0_A** ppm

PAC-3: **3.6_A** ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.1 ppm/0.14 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.3 ppm (0.4 milligram per cubic meter), 1993; Australia: TWA 0.3 ppm (0.4 milligram per cubic meter); STEL 1 ppm (1 milligram per cubic meter), 1993; Austria: MAK 0.1 ppm (0.15 milligram per cubic meter), 1999; Belgium: TWA 0.3 ppm (0.42 milligram per cubic meter); STEL 1 ppm (1.4 milligram per cubic meter), 1993; Denmark: TWA 0.1 ppm (0.15 milligram per cubic meter), 1999; Finland: TWA 0.1 ppm (0.15 milligram per cubic meter); STEL 0.3 ppm (0.4 milligram per cubic meter), 1999; France: VME 0.1 ppm (0.13 milligram per cubic meter), VLE 0.3 ppm (0.4 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.4 milligram per cubic meter, 2003; Norway: TWA 0.1 ppm (0.15 milligram per cubic meter), 1999; the Phillipines: TWA 0.3 ppm (0.4 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.1 milligram per cubic meter; MAC (STEL) 0.8 milligram per cubic meter, 1999; Russia: STEL 0.1 milligram per cubic meter, 1993; Sweden: NGV 0.3 ppm (0.4 milligram per cubic meter), KTV 1 ppm (1.4 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (0.15 milligram per cubic meter), KZG-W 0.2 ppm (0.3 milligram per cubic meter), 1999; Thailand: TWA 0.3 ppm (0.4 milligram per cubic meter), 1993; Turkey: TWA 0.3 ppm (0.4 milligram per cubic meter), 1993; United Kingdom: STEL 0.3 ppm (intermittent 0.42 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 1 ppm. Several states have set guidelines or standards for phosphine in ambient air[60] ranging from 1.33 μ/m^3 (New York) to 4.0 μ/m^3 (Florida and North Dakota) to 6.7 μ/m^3 (Virginia) to 8.0 μ/m^3 (Connecticut) to 10.0 μ/m^3 (Nevada and North Dakota) to 130 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1003, Phosphine, OSHA Analytical Method ID-180. See also NIOSH Analytical Method #6002.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 5.5 μg/L based on health effects.

Determination in Water: Phosphine cannot be used to contaminate water supplies; it breaks down in water. Octanol-water coefficient: Log K_{ow} = (estimated)—0.27. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Phosphine can be absorbed into the body by inhalation. Direct contact with phosphine liquid may cause frostbite.

Harmful Effects and Symptoms

Short-Term Exposure: Severe irritation to the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Contact with the liquid may cause frostbite. May affect the CNS; cardiovascular system; heart, gastrointestinal tract; liver and kidneys. Phosphine is a super-toxic gas with a probable oral lethal dose of 5 mg/kg or 7 drops for a 150 lb person. An air concentration of 3 ppm is safe for long-term exposure, 500 ppm is lethal in 30 minutes, and concentration of 1000 ppm is lethal after a few breaths. Acute exposure to phosphine usually results in headache, cough, tightness and pain in the chest; shortness of breath; dizziness, lethargy, and stupor. Fatigue, muscle pain; chills, tremors, loss of coordination; seizures, and coma may be seen. Pulmonary edema and cardiac arrhythmias are common. Gastrointestinal symptoms include nausea, vomiting, abdominal pain; and diarrhea. Renal (kidney) damage, hepatic (liver) damage; and jaundice may also occur.

Long-Term Exposure: Chronic poisoning may cause toothache, swelling of the jaw; spontaneous fractures of bones. May cause anemia. May damage the liver and kidneys. The effects are cumulative. Can irritate the lungs; bronchitis may develop.

Points of Attack: Respiratory system, liver.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); sputum cytology; white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, If phosphides have been ingested, **do not induce emesis**. Phosphides will release phosphine in the stomach; therefore, watch for signs similar to those produced by phosphine inhalation. Administer a slurry of activated charcoal at 1 gm/kg (usual adult dose: 60−90 g; child dose: 25−50 g). A soda can and a straw may be of assistance when offering charcoal to a child. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Decontamination: This is very important. The rapid physical removal of a chemical agent is essential. If you don't have the equipment and training, don't enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim can't move, decontaminate without touching and without entering the hot or the warm zone. Metallic phosphides on clothes, skin, or hair can off-gas phosphine after contact with water or moisture, so a risk of secondary contamination may be present. Have the victim remove clothing; and seal contaminated clothes and personal belongings in a sealed double bag. For skin exposure to the metallic phosphides, scrape or brush all visible particles from the skin and hair. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Don't wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Persons exposed only to phosphine gas do not pose substantial risks of secondary contamination. Vomitus containing phosphides can also off-gas phosphine. Rinse the eyes, mucous membranes; or open wounds with sterile saline or water and then move away from the hot zone in an upwind and up hill direction.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece scba operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a non-encapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical -resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered Air Purifying Respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 3 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 7.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 15 ppm:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 50 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Phosphine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides; permanganates, chlorates, and nitrates); strong acids (such as hydrochloric, sulfuric, and nitric); oxygen and halogenated hydrocarbons, since violent reactions occur. Store in tightly closed containers from physical damage. Use only non-sparking tools and equipment, especially when opening and closing containers of phosphine. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2199 Phosphine, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well -ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 2.5/4.1

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include phosphonic acid, oxides of phosphorus and flammable hydrogen gas. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. If material is on fire or involved in a fire, do not extinguish unless flow can be stopped; use water in flooding quantities as fog; cool all affected containers with flooding quantities of water; apply water from as far a distance as possible; solid streams of water may be ineffective; use "alcohol" foam, carbon dioxide or dry chemical. Wear full protective clothing including SCBA; rubber gloves; boots, and bands around legs, arms, and waist. No skin surface should be exposed. For massive fires in cargo areas, use unmanned hose holders or monitor nozzles. Move containers from fire area. The gas is heavier than air and may travel along the ground to an ignition source. Container may explode in heat of fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Controlled discharges of Phosphine may be passed through

10% NAOH solution in a scrubbing tower. The product may be discharged to a sewer[22].

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction),

FDA-over the counter drug.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 5000 lb (2270 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

European/International Regulations *(orthophosphoric acid)*: Hazard Symbol: C; Risk phrases: R15; R34; R36/37/38; R63; Safety phrases: S1/2; S26; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Phosphoric acid is a colorless, odorless, crystalline solid or a thick syrupy liquid. Physical state is strength and temperature dependent. Molecular weight = 98.00; Specific gravity (H_2O:1) = 1.87 (pure); 1.33 (50% solution) @ 25°C; Boiling point = decomposes <2132.8°C; Freezing/Melting point = 42.2°C Vapor pressure = 2.8×10^{-2} mmHg @ 20°C. Explosive limits: LEL = 17,900 ppm, UEL: unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0 (Corrosive). Highly soluble in water; forms acidic solution.

Potential Exposure: Phosphoric acid is used in the manufacture of fertilizers, phosphate salts; polyphosphates, detergents, activated carbon; animal feed; ceramics, dental cement; pharmaceuticals, soft drinks; gelatin, rust inhibitors; wax, and rubber latex. Exposure may also occur during electropolishing, engraving, photoengraving, lithographing, metal cleaning; sugar refining; and water-treating.

Incompatibilities: The substance is a medium strong acid. Incompatible with strong caustics; most metals. Readily attacks and reacts with metals forming flammable hydrogen gas. *Do not mix with solutions containing bleach or ammonia.* Violently polymerizes on contact with azo compounds; epoxides, and other polymerizable compounds. Decomposes on contact with metals, alcohols, aldehydes, cyanides, ketones, phenols, esters, sulfides, halogenated organics; producing toxic fumes. Corrosive to common metals and possibly to some rubbers and plastics.

Permissible Exposure Limits in Air:

NIOSH IDLH = 1000 milligram per cubic meter

OSHA PEL: 1 milligram per cubic meter TWA

NIOSH REL: 1 milligram per cubic meter TWA; 3 milligram per cubic meter STEL

ACGIH TLV[1]: 1 milligram per cubic meter TWA; 3 milligram per cubic meter STEL

PAC-1: **3**$_{\mathbf{E}}$ milligram per cubic meter

PAC-2: **30**$_{\mathbf{E}}$ milligram per cubic meter

PAC-3: 1**50**$_{\mathbf{E}}$ milligram per cubic meter

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

DFG MAK: 2 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy risk Group C.

Arab Republic of Egypt: TWA 1 milligram per cubic meter, 1993; Australia: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1993; Austria: MAK 1 milligram per cubic meter, 1999; Belgium: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter, 1993; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter [skin]1999; France: VME 1 milligram per cubic meter, VLE 3 milligram per cubic meter, 1999; Japan 1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Poland: MAC (TWA) 1 milligram per cubic meter; MAC (STEL) 3 milligram per cubic meter, 1999; Sweden: NGV 1 milligram per cubic meter, KTV 3 milligram per cubic meter, 1999; Switzerland: MAK-W 1 milligram per cubic meter, 1999; Thailand: TWA 1 milligram per cubic meter, 1993; United Kingdom: STEL 2 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL

3 milligram per cubic meter. Several states have set guidelines or standards for phosphoric acid in ambient air[60] ranging from 1.4 μ/m^3 (Massachusetts) to 10−30 μ/m^3 (North Dakota) to 10−33 μ/m^3 (Virginia) to 20.0 μ/m^3 (Connecticut) to 24.0 μ/m^3 (Nevada) to 25.0 μ/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #7903, Inorganic Acids; OSHA Analytical Method ID-165-SG.

Determination in Water: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Eye contact may cause permanent damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Solid is especially irritating to skin in the presence of moisture. Corrosive if swallowed. May cause pain in the throat and stomach, nausea, vomiting and intense thirst. Severe exposures may result in shock with clammy skin, weak and rapid pulse; shallow breathing; reduced urine output; and death. 1−5 milligram per cubic meter may cause irritation of nose and throat. 4−11 milligram per cubic meter may cause coughing. Inhalation of acid mist can cause lung irritation. 1−5 milligram per cubic meter may cause irritation of nose and throat. 4−11 milligram per cubic meter may cause coughing.

Long-Term Exposure: Repeated or prolonged skin exposure may cause irritation, drying, cracking, and dermatitis. Can cause bronchitis to develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene, nitrile + pvc, nitrile, Saranex, and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *25 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1000 milligram per cubic meter*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Phosphoric acid must be stored to avoid contact with metals, aldehydes, cyanides, mercaptans and sulfides, because violent reactions occur.

Shipping: UN1805 Phosphoric acid solution, Hazard class: 8; Labels: 8-Corrosive material. UN3543 Phosphoric acid solid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Phosphoric acid is a non-combustible solid or liquid. Thermal decomposition products may include oxides of phosphorus. Contact with common metals may release flammable hydrogen gas. Use extinguishing agent suitable for surrounding fire. Use water only to keep fire-exposed containers cool and to flush away spills. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to solution of soda ash and slaked lime with stirring, then flush to sewer with large volumes of water.

^^Hazardous to aquatic life or environment, with possible long lasting effects: white/yellow[291]; red[194]

European/International Regulations (*7723-14-0*): Hazard Symbol: F, T+, C, N; Risk phrases: R3; R11 (red); R16 (red); R17; R26/28; R35; R51; R62; (red); R50 (white/yellow); Safety phrases: S1/2; S5; S7 (red); S26; S28 (white/yellow); S29; S38; S41; S43 (red); S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Red: 2-Hazard to water; White/Yellow: 3-Severe hazard to water.

Description: Phosphorus is a white to yellow, soft, waxy solid with acrid fumes in air. *White/yellow* phosphorus is either a yellow or colorless, volatile, crystalline solid which darkens when exposed to light and ignites in air to form white fumes and greenish light. It has a garlic-like odor. Usually shipped or stored in water. Molecular weight = 123.88; Specific gravity (H_2O:1) = 1.8 @ 20°C; Boiling point = 280°C; Freezing/Melting point = (decomposes) 44°C; Vapor pressure = 0.026 mmHg @ 20°C; 0.181 mmHg @ 44.1°C; Autoignition temperature = 30°C. Hazard Identification (based on NFPA-704 M Rating System): (*white, red powder*) Health 4, Flammability 4, Reactivity 2. Insoluble in water.

Red phosphorus is a brick red, reddish-brown, or violet amorphous powder, frequently contaminated with a small amount of the yellow. Molecular weight = 30.97; Specific gravity (H_2O:1) = 1.8 @ 20°C; Boiling point = 281°C (with ignition @ 200°C); Freezing/Melting point = 45°C (sublimes); Flash point = 260°C; Autoignition temperature = 260°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: White or yellow phosphorus is handled away from air so that exposure is usually limited. Phosphorus was at one time used for the production of matches or "lucifers" but has long since been replaced due to its chronic toxicity. It is used in the manufacture of munitions including tracer bullets, pyrotechnics, explosives, smoke bombs; and other incendiary agents; (because it spontaneously catches fire in air) and as a smoke agent (because it produces clouds of irritating white smoke). Phosphorus is used artificial fertilizers; rodenticides, phosphor bronze alloys; semiconductors, Electro-luminescent coating; and chemicals, such as phosphoric and metallic phosphides. RP is used as a choking/pulmonary agent.

Incompatibilities: Phosphorus, a pyrophoric solid, spontaneously ignite on contact with air, producing toxic phosphorus oxide fumes. Reacts with strong bases, releasing toxic phosphine gas. Phosphorus reacts violently with oxidizers, halogens, some metals, nitrites, sulfur, and many other compounds, causing a fire and explosion hazard. *White/yellow* reacts with air, halogens, halides, sulfur, oxidizers, alkali hydroxides (forming gas); and metals (forming reactive phosphides). *Red* is a combustible solid. Friction or contact with oxidizers can cause ignition. Incompatible with many other substances. Forms gas and phosphoric acid on contact with moisture. Opened packages of red phosphorus should be stored under inert gas blanket.

Permissible Exposure Limits in Air:

NIOSH IDLH = 5 milligram per cubic meter

OSHA PEL (*yellow*): 0.1 milligram per cubic meter TWA

NIOSH REL (*yellow*): 0.1 milligram per cubic meter TWA

ACGIH TLV[1] (*yellow*): 0.02 ppm/0.1 milligram per cubic meter TWA

Protective Action Criteria (PAC) Ver. 29[138]

DFG MAK (*White/yellow/red*): 0.05 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(2); Pregnancy Risk Group C; *Color code-Red:* No numerical value established.

Arab Republic of Egypt: TWA 0.1 milligram per cubic meter, 1993; Australia: TWA 0.1 milligram per cubic meter, 1993; Belgium: TWA 0.1 milligram per cubic meter, 1993; Denmark: TWA 0.1 milligram per cubic meter, 1999; Finland: STEL 0.1 milligram per cubic meter, [skin], 1999; France: VME 0.1 milligram per cubic meter, VLE 0.3 milligram per cubic meter, 1999; Hungary: TWA 0.3 milligram per cubic meter; STEL 0.06 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; the Phillipines: TWA 0.1 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.3 milligram per cubic meter, 1993; Russia: STEL 0.03 milligram per cubic meter, 1993; Switzerland: MAK-W 0.1 milligram per cubic meter, KZG-W 0.2 milligram per cubic meter, 1999; Thailand: TWA 0.1 milligram per cubic meter, 1993; Turkey: TWA 0.1 milligram per cubic meter, 1993; United Kingdom: LTEL 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 milligram per cubic meter. The Czech Republic:[35] TWA 0.03 milligram per cubic meter; 0.06 milligram per cubic meter STEL. Several states have set guidelines or standards for yellow phosphorus in ambient air[60] ranging from 0.33 μ/m³ (New York) to 1.0 μ/m³ (Florida) to 1.6 μ/m³ (Virginia) to 2.0 μ/m³ (Connecticut and Nevada) to 10.0−30.0 μ/m³ (North Dakota).

Determination in Air: Use NIOSH Analytical Method (IV) #7905.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.1 μg/L and in surface water used for fishery purposes of zero.

Determination in Water: Octanol-water coefficient: Log K_{ow} = (estimated)—0.27. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Yellow phosphorus can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Phosphorus is corrosive to the eyes, skin, and respiratory tract. Eye contact may lead to a total destruction of the eyes. Victims may experience spontaneous hemorrhaging of phosphorus-contaminated skin and mucous membranes. Sudden death, possibly due to irregular heartbeat, may occur after relatively minor (10−15%) burns. *Yellow:* Fumes are irritating to the respiratory tract and cause severe ocular irritation. On contact with the skin it may ignite and produce severe skin burns with blistering. Very high exposure may cause severe or fatal poisoning. *Color code-Red:* Irritates eyes. Corrosive if ingested. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the kidneys, liver. Exposure may result in death. Phosphorus is classified as super toxic. The probable lethal dose is less than 5 mg/kg (a taste or less than 7 drops) for 70 kg (150 lb) person. Signs and symptoms of acute exposure to phosphorus may be severe and occur in three stages. The first stage will involve burns, pain, shock, intense thirst; nausea, vomiting, diarrhea, severe abdominal pain; and "smoking stools." The breath and feces may have garlicky odor. The second stage will be a symptom-free period of several days in which the patient appears to be recovering. The third stage may be severe and include nausea, bloody vomitus; diarrhea (may be bloody), jaundice, liver enlargement with tenderness; renal damage; hematuria (bloody urine), and either oliguria (little urine formation) or anuria (no urine formation). Headache, convulsions, delirium, coma, cardiac arrhythmias; and cardiovascular collapse may also occur. If phosphorus contacts the eyes, then severe irritation and burns, blepharospasm (spasmodic winking), lacrimation (tearing), and photophobia (heightened sensitivity to light) may occur.

Long-Term Exposure: Phosphorus may affect the bones, causing bone degeneration (especially the jaw bone, known as "phossy" jaw), dental pain; salivation, jaw pain and swelling. This process can extend into one or both eye sockets. Repeated low exposure can cause low blood count (anemia), weight loss; and bronchitis. May cause jaundice; liver and kidney damage; cachexia. May cause nervous system damage.

Points of Attack: Respiratory system, liver, kidneys, jaw, teeth, blood, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: CBC, anemia; dental X-ray/examination; liver function tests. Also consider EKG. Special consideration should be given to the skin, eyes, jaws, teeth, respiratory tract; and liver. Preplacement medical and dental examination with X-rays of teeth is highly recommended in the case of yellow phosphorus exposure. Poor dental hygiene may increase the risk in yellow phosphorus exposures, and any required dental work should be completed before workers are assigned to areas of possible exposure. Workers experiencing any jaw injury, tooth extraction; or any abnormal dental conditions should be removed from areas of exposure and observed. X-ray examinations may show necrosis; however, in order to prevent full development of sequestra, the disease should be diagnosed in earlier stages. Liver function should be evaluated periodically.

First Aid: There is no antidote for white phosphorus toxicity. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and brush all traces of dry chemical from skin. Submerge burning phosphorus (yellow) in water or 1% copper sulfate solution if embedded in skin, or wash exposed area with large amounts of water. Seek medical attention immediately. Skin burns from yellow phosphorus should be observed for 1−3 days for possible delayed effects. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 milligram per cubic meter:* Sa (APF = 10) (any supplied-air respirator). *2.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 milligram per cubic meter:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Color code-Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 meters or a 1-hour fire wall from flammable or reactive materials. Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Phosphorus must be stored in a cool, well ventilated area away from heat, direct sunlight; air, organic materials; oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Always store away from alkaline materials because of the extreme fire hazard and because poisonous gas is produced. Always store yellow phosphorus under water and protect it from physical damage. Opened packages of red phosphorus should be stored under inert gas blanket. Sources of ignition, such as smoking and open flames, are prohibited where phosphorus is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1338 Phosphorus, amorphous, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN1381 Phosphorus, white, dry; under water, in solution; Phosphorus, yellow, dry; yellow, under water; in solution, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material, 6.1-Poisonous materials. UN2447 Phosphorus white, molten, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material, 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Keep spilled material wet and cover with wet sand or dirt. Collect solidified material in the most convenient and safe manner and cover with water in sealed containers. Ventilate area after cleanup is complete. Keep phosphorus out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Phosphorus (white/yellow) is a flammable solid which ignites spontaneously in moist air. Combustion in a confined space will deplete oxygen causing asphyxiation. Thermal decomposition products may include oxides of phosphorus and phosphoric acid if water is present. Fire may restart after it has been extinguished. *Small fires:* dry chemical, sand, water spray; or foam. *Large fires:* water spray, fog, or foam. Cool containers that are exposed to flames with water from the side until well after fire is out. *White/Yellow:* Deluge with water, taking care not to scatter, until fire is extinguished and phosphorus has solidified, then cover with wet sand or dirt. *Color code-Red:* Flood with water and when fire is extinguished, cover with wet sand or dirt. Extreme caution should be used during clean up of the more hazardous white phosphorus. *White/Yellow:* Ignites at approximately 30°C in air; ignition temperature is higher when air is dry. *Black:* Does not catch fire spontaneously. *Color code-Red:* Catches fire when heated in air to approximately 260°C and burns with formation of the pentoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration followed by alkaline scrubbing and particulate removal equipment.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (≥1.00% concentration). (1% concentration); *Theft hazard* 220 (≥80.00% concentration); Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison inhalation hazard: exposure can be lethal, High acute toxicity, Oxidizer, Violently reactive with water.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 5000 lb (2270 kg)

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard Symbols, Risk & Safety statements: Hazard Symbol: T+, C; Risk phrases: R14; R22; R26; R29; R34; R35; R37; R48/23; Safety phrases: S1/2; S7/8; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Phosphorus oxychloride is a clear, colorless to yellow, fuming, oily liquid with a pungent and musty odor. Molecular weight = 153.32; Specific gravity (H_2O:1) = 1.69 @ 16°C; Boiling point = 105.6°C; Freezing/Melting point = 1.25°C; Vapor pressure = 40 mmHg @ 27°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 3₩ (Corrosive). Reacts with water; decomposes with heat.

Potential Exposure: Phosphorus oxychloride is used in the manufacture of pesticides, pharmaceuticals, plasticizers, gasoline additives; and hydraulic fluids.

Incompatibilities: A powerful oxidizer. Violently decomposes in water, forming heat and hydrochloric and phosphoric acids. Violent reaction with alcohols, phenols, amines, reducing agents; combustible materials; carbon disulfide; dimethylformamide, and many other many materials. Rapid corrosion of metals, except nickel and lead.

Permissible Exposure Limits in Air:

Conversion factor: 1 ppm = 6.27 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.1 ppm/0.6 milligram per cubic meter TWA; 0.5 ppm/3 milligram per cubic meter STEL

ACGIH TLV[1]: 0.1 ppm/0.63 milligram per cubic meter TWA

Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: 0.48 ppm

PAC-3: **0.85_A** ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.2 ppm/1.3 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group C

Australia: TWA 0.1 ppm (0.6 milligram per cubic meter); STEL 0.5 ppm, 1993; Austria: MAK 0.2 ppm (1 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.63 milligram per cubic meter); STEL 0.5 ppm, 1993; Denmark: TWA 0.1 ppm (0.6 milligram per cubic meter), 1999; Finland: STEL 0.5 ppm (3 milligram per cubic meter), [skin], 1999; France: VME 0.1 ppm (0.6 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.6 milligram per cubic meter, 2003; Russia: STEL 0.05 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 0.1 ppm (0.6 milligram per cubic meter), KZG-W 0.2 ppm (1.2 milligram per cubic meter), 1999; Turkey: TWA 0.5 ppm (3 milligram per cubic meter), 1993; United Kingdom: TWA 0.2 ppm (1.3 milligram per cubic meter); STEL 0.6 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.1 ppm. Several states have set guidelines or standards for $POCl_2$ in ambient air[60] ranging from 6.0−30.0 μ/m^3 (North Dakota) to 12.0 μ/m^3 (Connecticut) to 14.0 μ/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: No criteria set. ($POCl_2$ decomposes in water).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Eye contact can cause permanent damage. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. This material is toxic by inhalation and ingestion and is strongly irritating to skin and tissues. It causes burns of the mucous membranes of the mouth and digestive tract; and may be fatal. Symptoms include burns and extensive reddening of eyes, pains in throat; coughing, labored breathing with a shortness of breath; dizziness, headache, weakness, nausea, vomiting, chest pain; bronchitis, bronchopneumonia, kidney, and liver damage.

Long-Term Exposure: May cause nephritis; kidney damage. May cause liver damage.

Points of Attack: Eyes, skin, respiratory system; CNS; kidneys, liver.

Medical Surveillance. Lung function tests. Test for liver and kidney functions. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting. Medical observation is

recommended for 24–48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (3) Color code-White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from incompatible materials listed above. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1810 Phosphorus oxychloride, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/90
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 1.4/2.3

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Keep material out of water sources and sewers; build dikes to contain flow as necessary; use water spray to knock down vapors; *Do not use water* on material itself; and neutralize spilled material with crushed limestone, soda ash; or lime. *For a land spill*, dig a pit, pond, lagoon, or holding area to contain liquid or solid material; dike surface flow using soil, sand bags; foamed polyurethane; or foamed concrete; absorb bulk liquid with fly ash or cement powder; neutralize with agricultural lime (slaked lime), crushed limestone; or sodium bicarbonate. *For a water spill*, neutralize with agricultural lime (slaked lime), crushed limestone; or sodium bicarbonate; use mechanical dredges or lifts to remove immobilized masses of pollutants and precipitates; adjust pH to neutral (pH-7). *For air spills* apply water spray or mist to knock down vapors; vapor knock down water is corrosive or toxic and should be diked for containment. Stop leak if you can do so without risk. Do not touch spilled material. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Clean up only under supervision of an expert. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
