Synonyms: Ethyl silicon trichloride; Ethyl trichloroethylsilane; Ethyl trichlorosilane; Ethyltrichlorosilane; Silane, trichloroethyl-; Silicane, trichloroethyl-; Trichloroethylsilicane
CAS Registry Number: 115-21-9
HSDB Number: 884
RTECS Number: VV4200000
UN/NA & ERG Number: UN1196/155
EC Number: 204-072-6
Regulatory Authority and Advisory Information
Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).
Hazard Alert: Highly flammable, Violently reactive with water, Organometallic, Strong reducing agent, Primary irritant (w/o allergic reaction).
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
EPCRA Section 304 RQ: 500 lb (227 kg).
Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, Xn; risk phrases: R11; R14; R22; R26; R34; safety phrases: S1; S16; S21, S26; S28; S36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Ethyl trichlorosilane is a colorless liquid with an irritating odor. Molecular weight = 163.51; specific gravity (H_2O:1) = 1.24 @ 25°C; boiling point = 98°C; freezing/melting point = −106°C; vapor pressure = 47 mmHg @ 25°C; flash point = 22°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2 ₩. Water reactive, rapidly releasing corrosive hydrogen chloride gas.
Potential Exposure: Used in the manufacture of silicone polymers.
Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.
Permissible Exposure Limits in Air
PAC* Ver. 29[138]
PAC-1: $\mathbf{0.60}_{\mathbf{A}}$ ppm
PAC-2: $\mathbf{7.3}_{\mathbf{A}}$ ppm
PAC-3: $\mathbf{33}_{\mathbf{A}}$ ppm
*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.
Routes of Entry: Inhalation, ingestion, and skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact with the eyes causes irritation, pain, swelling; corneal erosion and blindness may result. Contact with the skin causes dermatitis (red, inflamed skin), severe burns, pain, and shock generally follow dermal exposure. Acute inhalation exposure may result in sneezing, choking, laryngitis, dyspnea (shortness of breath), respiratory tract irritation, and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa; pulmonary edema; chronic bronchitis; and pneumonia may also occur. If ingested, symptoms include increased salivation; intense thirst; difficulty in swallowing; chills; pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion.
Long-Term Exposure: May cause kidney damage. Highly irritating substances can cause lung irritation and bronchitis.
Points of Attack: Lungs and kidneys.
Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Lung function tests. Kidney function tests. If symptom develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary

edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to ethyl trichlorosilane, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ethyl trichlorosilane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam and moisture; because toxic and corrosive chloride gases; including hydrogen chloride; can be produced. Sources of ignition, such as smoking and open flames, are prohibited where ethyl trichlorosilane is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1196 Ethyltrichlorosilane, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.

Spill Handling:

Initial Isolation and Protective Action Distances: Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

When Spilled in Water

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 0.5/0.8
Night 1.7/2.7

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. If water pollution occurs, notify appropriate authorities. Shut off ignition sources; no flares, smoking or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors do not get water inside container. *Small spills:* Flush area with flooding amounts of water. *Large spills:* Dike far ahead of spill for later disposal. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include phosgene. Use dry chemical, CO_2 or foam extinguishers. *Do not use water.* Vapor explosion hazard indoors, outdoors, or in sewers. Runoff to sewer may create fire or explosion hazard. Move container from fire area if you can do it without risk. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside container. Cool containers that are exposed to flames with water from the side until well after fire is out. Stay away from ends of tanks. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Etridiazole E:0848

Formula: $C_5H_5C_{13}N_2OS$

Synonyms: 4-Way; 5-Ethoxy-3-(trichloromethyl)-1,2,4-thiadiazole; Aaterra; Banrot (with thiophanate-methyl); Dwell; Ethazole; Ethazole; ETMT; Etridiazole; Koban; Mf-344; Olin mathieson 2424; OM 2424; Pansoil; Terrachlor-Super X (with Pentachloronitrobenzene); Terraclor Super X (with Pentachloronitrobenzene); Terracoat; Terraflo; Terramaster; Terrazole; 1,2,4-Thiadiazole, 5-ethoxy-3-(trichloromethyl)-; 3-(Trichloromethyl)-5-ethoxy-1,2,4-thiadiazole; Truban

CAS Number: 2593-15-9; 153233-91-1

HSDB Number: 1709

RTECS Number: XI3875000

UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: 219-991-8 [*Annex I Index No.*: 613-133-00-X]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group B2, probable human carcinogen; EU GHS Category 2: Suspected human carcinogen California Proposition 65 Chemical[102]: Carcinogen (10/1/1994)

Hazard Alert: Poison, Suspected reprotoxic hazard, Endocrine Disruptor Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active] as terrazole Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N; risk phrases: R21; R22; R23; R40; R50/53; safety phrases: S1/2; S36/37; S38; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Pale-yellow liquid when pure or reddish-brown liquid or semisolid as a technical product. Mild odor. Molecular weight = 247.53; specific gravity (H_2O:1) = 1.503; freezing/melting point = 20.1°C; boiling point = 95°C @1 mmHg; vapor pressure = 1.3×10^{-4} mmHg @ 20°C; 9.75×10^{-5} mmHg @ 25°C; flash point = 155°C. Moderately soluble in water; solubility = 50−110 mg/L @ 25°C.

Potential Exposure: Aromatic hydrocarbon; Thiazole fungicide Etridiazole is a fungicide used in some countries as a seed treatment on barley, beans, corn, cotton, peanuts, peas, sorghum, soybeans, safflower, and wheat. It is also used on cotton for in-furrow application at planting, on ornamental plants and shrubs by horticultural nurseries, on nonbearing citrus and nonbearing coffee, and for golf course fairways, tees and greens. Some states hold Special Local Need registrations for use on tobacco transplants.

Incompatibilities: Diazo compounds can detonate. This applies in particular to organic azides that have been sensitized by the addition of metal salts or strong acids. Toxic gases are formed by mixing materials of this class with acids, aldehydes, amides, carbamates, cyanides, inorganic fluorides, halogenated organics, isocyanates, ketones, metals, nitrides, peroxides, phenols, epoxides, acyl halides, and strong oxidizing or reducing agents. Flammable gases are formed by mixing materials in this group with alkali metals. Explosive combination can occur with strong oxidizing agents, metal salts, peroxides, and sulfides. This chemical is sensitive to prolonged exposure to heat. This chemical is incompatible with strong oxidizing agents[101].

Permissible Exposure Limits in Air:

OEL (Russia): 1 milligram per cubic meter STEL (1/1993)[9]

Permissible Concentration in Water: State Drinking Water Guidelines: Florida 175 μg/L.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Low−369.29192 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. May be harmful if swallowed. Skin sensitizer. LD_{50} (oral, rat) = > 1000 mg/kg; LD_{50} (dermal, rabbit) = > 1700 mg/kg.

Long-Term Exposure: Skin sensitizer. Possible liver toxin. A neurotoxin. Endocrine system disruptor. Reproductive effects. Human toxicity (long term)[101]: Intermediate—10.51051 ppb, CHCL (Chronic Human Carcinogen Level)

Points of Attack: Skin, liver, brain, and endocrine system.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests; routine blood analysis. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Because of its low vapor pressure and low order of toxicity, it does not usually present a major problem in industry. Protective creams, gloves, and masks with organic vapor canisters for use in areas of elevated vapor concentrations should suffice. Elevated temperature may increase the requirement for protective methods or ventilation. Wear appropriate clothing to prevent repeated or prolonged dermal and/or eye contact. Wear eye protection to prevent any possibility of eye contact with molten biphenyl. Employees should wash promptly when skin is contaminated. Work clothing should be changed daily as it may be contaminated. Remove nonimpervious clothing immediately if wet or contaminated.

Respirator Selection: Up to 10 milligram per cubic meter*:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). Up to 25 milligram per cubic meter*:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie* (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). Up to 50 milligram per cubic meter*:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge (s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie* (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) Any supplied-air respirator with a full facepiece. Up to 100 milligram per cubic meter*:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD,PP (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard: Store in a secure poison location. Before entering confined space where biphenyl may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24 h response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)

Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Establish ventilation to keep levels below explosive limit. Don't wash it away. Instead, sprinkle the spill with sawdust, vermiculite, or kitty litter. Sweep it into a plastic garbage bag, and dispose of it as directed on the pesticide product label. Wash all contaminated surfaces with a soap and water solution. Do not re-enter the contaminated area until and expert verifies that the area has been properly cleaned. Ventilate area of spill or leak following clean-up. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and sulfur, chlorides, hydrogen chloride gas, carbon monoxide, and acrid smoke. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

F

Fenbutatin Oxide F:0085

Formula: $C_{60}H_{78}OSn_2$
Synonyms: AI3-27738; BENDEX; Bis(trineophyltin) oxide; Bis[tris(β,β-dimethylphenethyl)tin]oxide; Bis[tris(2-methyl-2-phenylpropyl)tin]oxide; Caswell No. 481DD; Distannoxane, hexakis(2-methyl-2-phenylpropyl)-; Distannoxane, hexakis(β,β-dimethylphenethyl)-; Di[tri(2,2-dimethyl-2-phenylethyl)tin]oxide; ENT 27738; Fenbutatin-oxyde; Hexakis; Hexakis(β,β-dimethylphenethyl)distannoxane; Hexakis(2-methyl-2-phenylpropyl)distannoxane; 2-(Methyl-2-phenylpropyl)distannoxane; Neostanox; Osdaran; SD-14114; Shell SD-14114; Torque; Vendex
CAS Number: 13356-08-6
HSDB Number: 6632; 7001 for tin compounds
RTECS Number: JN8770000
UN/NA & ERG Number: UN2786/154; UN2811 (toxic solid, organic, n.o.s.)/154
EC Number: 236-407-7 [*Annex I Index No.:* 050-017-00-2]
Regulatory Authority and Advisory Information
Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans
Hazard Alert: Poison, Developmental toxin (TRI), Environmental hazard.
EPCRA Section 313 Form R de minimus concentration reporting level: 1.0%
United States DOT Regulated United States DOT Regulated marine pollutant (49CFR172.101, Appendix B), severe pollutant, as organotin pesticide compounds
Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn, N; risk phrases: R26; R36/38; R50/R53; safety phrases: S1/2; S28; S36/37; S45; S60; S61; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters
Description: White crystalline solid or powder. Mild odor. Molecular weight = 1052.66; specific gravity (H_2O:1) = 1.312; boiling point = (decomposes) 238°C @ 0.05 mm; freezing/melting point = 138°C; 148°C; vapor pressure = 1.8×10^{-11} mmHg @ 20°C. Practically insoluble in water; solubility = 0.005 mg/L @ 23°C.
Potential Exposure: Organotin/phenyltin insecticide and selective miticide for deciduous pome and stone fruits, citrus fruits, grapes, vegetables, berry fruit, nut crops (selected), ornamentals, and greenhouse crops. A United States Environmental Protection Agency Restricted Use Pesticide (RUP).
Incompatibilities: May form explosive mixture with air. Decomposes above 230C. Contact with water causes slow decomposition. Orgotin oxides can be strongly basic and will react, possibly dangerously, with acidic compounds and mixtures.
Permissible Exposure Limits in Air:
NIOSH IDLH = 25 mg[Sn]/m^3
OSHA PEL: 0.1 mg[Sn]/m^3 TWA [*Note*: The PEL applies to all organic tin compounds.]
NIOSH REL: 0.1 mg[Sn]/m^3 TWA [skin] [*Note:* The REL applies to all organic tin compounds, except cyhexatin.]
ACGIH TLV[1]: 0.1 mg[Sn]/m^3 TWA; 0.2 mg[Sn]/m^3 STEL [skin], A4, not classified as a human carcinogen
DFG MAK: 0.1 mg[Sn]/m^3; inhalable fraction TWA; Peak Limitation Category II(2); [skin]; Pregnancy Risk Group D
Phenyltin compounds
DFG MAK: 0.002 mg[Sn]/m^3; inhalable fraction TWA; Peak Limitation Category II(2); Pregnancy Risk Group C
Determination in Air: Filter/XAD-2 (tube); CH_3COOH/CH_3CN; High-pressure liquid chromatography/Graphite furnace atomic absorption spectrometry; NIOSH IV Method #5504, as organotin compounds[18].
Permissible Concentration in Water: State Drinking Water Guidelines: Minnesota 4000 μg[Sn]/L.
Determination in Water: Octanol–water coefficient: Log K_{ow} = > 4.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.
Routes of Entry: Inhalation, skin, and/or eye contact. Absorbed through the skin
Harmful Effects and Symptoms
Short-Term Exposure: Highly toxic. Irritates the eyes, skin, and respiratory tract. Contact may cause skin burns. Inhalation can cause coughing, wheezing, and/or shortness of breath. Toxic hazard rating is high for oral, intravenous, intraperitoneal administration. This material causes swelling of the brain and spinal cord. Exposure may result in muscular weakness and paralysis, leading to respiratory failure; convulsive movements; closure of eyelids and sensitivity to light; headaches, and EEG changes, headache, dizziness, psychological and neurological disturbances, vertigo (an illusion of movement), sore throat, cough, abdominal pain, nausea, vomiting, diarrhea; urine retention; paresis, focal anesthesia; pruritus. Higher levels can cause unconsciousness, collapse, and death. LD_{50} (oral, rat) = > 2.5 g/kg; LD_{50} (dermal, rat) = 1000 mg/kg.
Long-Term Exposure*:* Repeated or prolonged contact can cause dermatitis; dry and cracked skin. May cause brain damage, hepatic necrosis; kidney damage. Some organotin compounds, such as dibutyltins and tributyltins, have been shown to affect the immune system in animals, but this has not been examined in people. Studies in animals and people also have shown that some organotins, such as dibutyltins, tributyltins, and triphenyltins, can affect the reproductive system. Reproductive effects.
Points of Attack: Skin, brain, kidneys.
Medical Surveillance: Kidney function tests. Psychological testing. Examination of the nervous system. EEG.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00006-5

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *[Tin, organic compounds as (Sn)]*: *Up to 1 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 5 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus (SCBA) with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 25 milligram per cubic meter*133: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full-faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dark, well-ventilated area away from oxidizers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep ethylene glycol diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include inorganic tin, tin oxides, and phenyltin compounds. This material is a severe marine pollutant. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire:* Dry chemical, carbon dioxide, or water spray. *Large fire:* Dry chemical, carbon dioxide, alcohol-resistant foam, or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads:* Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Organic tin compounds may be disposed of in sealed containers in secured sanitary landfill. *Chemical Treatability of tin; Concentration Process*: Chemical precipitation; Chemical Classification: Metals; Scale of Study: Pilot scale; Type of Wastewater Used: Synthetic wastewater; Results of Study: At 600 ppm, 95.3% reduction with alum. At 500 ppm, 98% reduction with ferric chloride, 92% reduction with lime (three coagulants used: 200 mg of alum at pH = 6.4, 40 ppm of ferric chloride @ pH = 6.2, 41 ppm of lime @ pH = 11.5 Chemical coagulation was followed by dual media filtration)[83]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Negative: Rodent dominant lethal; Host-mediated assay; Inconclusive: *D. melanogaster* sex-linked lethal.

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1 lb (0.454 kg)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R33; R50/53; R62; R63; safety phrases: S2; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Fenitrothion is a volatile brownish-yellow oil. Molecular weight = 277.25; boiling point = (decomposes) @ 140°C; freezing/melting point = 0.28°C; vapor pressure = 5.3×10^{-5} mbar @ 20°C; flash point = 157°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this insecticide. It is a selective acaricide; and a contact and stomach insecticide. Used to control chewing and sucking insects on rice, orchard fruit; vegetables, cereals, cotton, and in forests. Also protects against flies, mosquitoes, and cockroaches.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

No standards or Protective Action Criteria (PAC) available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Japan: 1 milligram per cubic meter [skin] 1999; Poland: MAC (TWA) 0.02 milligram per cubic meter, MAC (STEL) 0.1 milligram per cubic meter, 1999; Russia: STEL 0.1 milligram per cubic meter [skin] 1993. Russia[43] set a MAC in ambient air in residential areas of 0.008 milligram per cubic meter on a momentary basis and 0.001 milligram per cubic meter on a daily average basis.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies for domestic purposes of 0.25 mg/L; in water bodies used for fishery purposes of zero.

Determination in Water: Fish Tox = 63.62386000 ppb (INTERMEDIATE). Octanol−water coefficient: Log K_{ow} = > 3.2. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, through the skin, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. Nausea is often the first symptom, followed by vomiting; abdominal cramps; diarrhea, excessive salivation; headache, giddiness, dizziness, weakness, tightness in the chest; loss of muscle coordination; slurring of speech; muscle twitching (particularly the tongue and eyelid); respiratory difficulty; blurring or dimness of vision; pinpoint pupils; profound weakness; mental confusion; disorientation, and drowsiness. This compound is an organophosphate insecticide. It is a highly toxic cholinesterase inhibitor that acts on the nervous system. Does not cause delayed neurotoxicity and contact produces little irritation. The effects may be delayed. Keep exposed victim under medical observation. Human Tox = 9.10000 ppb (HIGH)

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Also consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Keep victim under medical observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3017 Organophosphorus pesticides, liquid, toxic, flammable, flash point not <23°C, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. *Small fires:* Dry chemical, carbon dioxide; water spray; or foam. *Large fires:* Water spray, fog, or foam. Move containers from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (for large amounts); alkaline hydrolysis and landfill (for small amounts)[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

HSDB Number: 6848 (66441-23-4)

RTECS Number: UA2454000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 266-362-9 [*Annex I Index No.:* 604-039-00-X]

Regulatory Authority and Advisory Information

California Proposition 65 Chemical[102]: Developmental/ Reproductive toxin (3/26/1999)

Hazard Alert: Suspected reprotoxic hazard, Environmental hazard, Ground water contaminant (PAN), Sensitization hazard (skin), Reproductive toxin. (P-ethyl) Listed for Tier 1 screening as an endocrine disruptor[88].

California EPAAB2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%

Marine Pollutant: IMDG

Hazardous to aquatic life or environment, with possible long-lasting effects[192]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R43; R50/53; safety phrases: S2; S24; S29/35; S37, S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Colorless or white solid. Liquid form is dark brown with an aromatic hydrocarbon odor. Molecular weight = 361.78; specific gravity (H_2O:1) = 1.33; boiling point = 199.6°C; freezing/melting point = 84−86°C; vapor pressure = 3.2×10^{-8} mmHg @ 20°C. Practically insoluble in water.

Potential Exposure: A chlorophenoxy/aryloxyphenoxypropionate herbicide used to control annual and perennial grassy weeds in potatoes, soy beans, beans, beets, vegetables, flax, ground nuts, rape, and cotton.

Incompatibilities: Decomposed by acids and alkalis. May react with strong oxidizers such as chlorates, peroxides, nitrates, etc.

Determination in Water: Octanol−water coefficient: Log K_{ow} = > 4.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Intermediate—34.71346 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Inhalation, ingestion, absorbed through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin, eyes, and respiratory tract. Eye contact may cause irritation, burning sensation, and damage. Harmful if ingested, inhaled or absorbed through the skin. May be harmful if swallowed. LD_{50} (oral, rat) = > 2 g/kg; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: May cause skin sensitization. May cause reproductive and fetal effects. Human toxicity (long term)[101]: Intermediate—17.50 ppb, Health advisory

Points of Attack: Skin. Reproductive system.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Comprehensive physical examination with emphasis on the genito-urinary tract analysis to include sperm count, motility, and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH), may be carried out if, in the opinion of a physician, they are indicated. Consult a physician if poisoning is suspected or if redness, itching, or burning of the eyes or skin develop. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with 2,4-DP all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and bases. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically transfer material from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: *Solid material:* First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid formulations containing organic solvents*: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/ 0.5 mi in all directions. *On a small fire:* Use dry chemical, CO_2, water spray, or regular *foam. On a large fire:* Use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. *Solid material:* A combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. *Liquid formulations containing organic solvents:* A combustible liquid. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazard Alert: Poison inhalation hazard: Exposure can be lethal, Neurotoxin (cumulative), Combustible, Environmental hazard, Suspected reprotoxic hazard, Environmental hazard.
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)
United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)
United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.
Hazardous to aquatic life or environment, with possible long-lasting effects [291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R26/27/28; R33; R50/53; safety phrases: S1/2; S23; S28; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Fensulfothion is a yellow oil. Molecular weight = 308.37; boiling point = 138−141°C at 0.01 mmHg; vapor pressure = 0.0001 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. Slightly soluble in water.
Potential Exposure: A potential danger to those involved in the manufacture, formulation, or application of this insecticide used to control parasitic, sedentary, and free-living nematodes.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 0.1 milligram per cubic meter TWA
ACGIH TLV[1]: 0.01 milligram per cubic meter TWA inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI_A issued for Acetylcholinesterase inhibiting pesticides
PAC Ver. 29[138]
PAC-1: 0.18 milligram per cubic meter
PAC-2: 2 milligram per cubic meter
PAC-3: 3.1 milligram per cubic meter
Australia: TWA 0.1 milligram per cubic meter, 1993; Belgium: TWA 0.1 milligram per cubic meter, 1993; France: VME 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.1 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Not classifiable as a human carcinogen. Several states have set guidelines or standards for fensulfothion in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).
Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.
Determination in Water: Fish Tox = 6.96732000 pbb (INTERMEDIATE)
Routes of Entry: Inhalation, through the skin, ingestion. eyes.
Harmful Effects and Symptoms
Short-Term Exposure: Contact can irritate the skin and eyes. Exposure can cause rapid, fatal organophosphate poisoning. The acute oral LD_{50} value for rats is 5−10 mg/kg which is highly to extremely toxic. It is a cholinesterase inhibitor. This material may cause nausea, vomiting, abdominal cramps; diarrhea, headache, giddiness, vertigo, weakness, lack of muscle control; tearing, slurring of

speech; difficult breathing; convulsions, excessive salivation; tightness in chest; and death from respiratory arrest. Death results primarily from respiratory arrest stemming from failure of the respiratory center; paralysis of respiratory muscles and intensive bronchoconstriction. Human Tox = 1.75000 ppb (HIGH)

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over *0.1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases; strong oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m)600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Hazard Alert: Poison, Neurotoxin (cumulative), Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

Regulations: Hazard symbol: T, N; risk phrases: R21/22; R23; R33; R48/25; R68; R50/53; R62; R63; safety phrases: S1/2; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Fenthion is a colorless liquid (when pure) with a weak, garlic-like odor. The technical grade is a yellow-to-brown oil. Molecular weight = 278.34; boiling point = (decomposes below the BP @ 210°C; freezing/melting point = 6.1°C; vapor pressure = 0.0003 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Very slightly soluble in water; solubility = 0.006%.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, or application of this agricultural chemical and pesticide; insecticide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alkaline insecticides. Organothiophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101].

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: None. Appendix D (NIOSH Pocket Guide)

ACGIH TLV[1]: 0.05 milligram per cubic meter inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI_A issued for Acetylcholinesterase inhibiting pesticides.

PAC Ver. 29[138] PAC-1: 0.15 milligram per cubic meter

PAC-2: 5.9 milligram per cubic meter

PAC-3: 35 milligram per cubic meter

DFG MAK: 0.2 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(2) [skin]

Australia: TWA 0.2 milligram per cubic meter [skin], 1993; Austria: MAK 0.2 milligram per cubic meter [skin], 1999; Belgium: TWA 0.2 milligram per cubic meter [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter [skin], 1999; Japan: 0.2 milligram per cubic meter [skin], 1999; Poland: MAC (TWA) 0.2 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Not classifiable as a human carcinogen. Several states have set guidelines or standards for fenthion in ambient air[60] ranging from 2.0 μ/m^3 (North Dakota) to 3.2 μ/m^3 (Virginia) to 4.0 μ/m^3 (Connecticut) to 5.0 μ/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Mexico[35] set a MAC in coastal waters of 0.03 μg/L and 0.0003 mg/L (0.3 μg/L) in estuaries. Russia[35] set a MAC in water bodies used for domestic purposes of 1.0 μg/L and in water used for fishery purposes of zero.

Determination in Water: Fish Tox = 10.60669000 ppb (INTERMEDIATE)

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Fenthion can affect you when breathed in and quickly enters the body by passing through the skin. Fatal poisoning can occur from skin contact. It is highly toxic. It may damage the developing fetus. Exposure can cause rapid fatal organophosphate poisoning with headaches, sweating, nausea and vomiting, muscle twitching; coma and death. Sometimes, effects are delayed for 1–2 days. Poisoning can happen from skin contact, even if no irritation is felt. Human Tox = 4.90000 ppb (HIGH).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Fenthion may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: Plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If exposure and/or symptoms have occurred, the person should be under medical observation for several days, as some symptoms may be delayed.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working

with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over *0.2 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, alkalies, and alkaline pesticides. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: Dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Fenthion itself does not burn readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis and landfill for small quantities; incineration with flue gas scrubbing for large amounts[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Fenvalerate F:0128

Formula: $C_{25}H_{22}ClNO_3$
Synonyms: A13-29235; Belmark; Benzeneacetic acid, 4-chloro-α-(1-methylethyl)-, cyano(3-phenoxyphenyl)methyl ester; Caswell No. 077A; (IRS)-α-Cyano-3-phenoxybenzyl (RS)-2-(4-chlorophenyl)-3-methybutyrate; α-Cyano-3-phenoxybenzyl 2-(4-chlorophenyl)isovalerate; α-Cyano-3-phenoxybenzyl-2-(4-chlorophenyl)-3-methybutyrate; Cyano(3-phenoxyphenyl)methyl 4-chloro-α-(1-methylethyl)benzeneacetate; Cyano-(3-phenoxybenzyl)methyl 2-(4-chlorophenyl)-3-methylbutyrate; Cyano-(3-phenoxyphenyl)methyl 4-chloro-α-(1-methylethyl)benzeneacetate; Cyano(3-phenoxyphenyl)methyl ester of 4-chloro-α-(1-methylethyl) benzeneacetic acid; α-Cyano-*m*-phenoxybenzyl 2-(*p*-chlorophenyl)-3-methylbutyrate; 4-Chloro-α-(1-methylethyl)benzeneacetic acid, cyano(3-phenoxyphenyl)methyl ester; 4-Chloro-α-(1-methylethyl)benzeneacetic acid cyano(3-phenoxyphenyl)methyl ester; Ectin; Evercide; Fenkill; Fenvaleriato (Spanish); Koranda; Phenvalerate; Pydrin; S 5602; Sanmarton; SD 43775; Sumicide; Sumicidine; Sumicidin; Sumifleece; Sumifly; Sumipower; Sumitick; Tirade; W 1 43775
CAS Number: 51630-58-1
HSDB Number: 6640
RTECS Number: CY1576300
UN/NA & ERG Number: UN3352 (liquid)/151; UN3349 (pyrethroid pesticide, solid, toxic)/151
EC Number: 257-326-3
Regulatory Authority and Advisory Information
Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans; IARC, Group 3 not classifiable as to its carcinogenicity in humans.
Hazard Alert: Poison, Suspected reprotoxic hazard, Possible endocrine disruptor, Environmental hazard.
Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum
Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins
United States DOT Regulated marine pollutant (49CFR172.101, Appendix B), severe pollutant.
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Yellowish to brown viscous liquid. Also available as an emulsifiable concentrate, which is corrosive. Technical grade is a brown viscous liquid. Faint chemical odor. Boiling point = decomposes. Molecular weight 419.93; specific gravity (H_2O:1) = 1.17 @ 23°C; vapor pressure = 1.1×10^{-8} mmHg @ 25°C; 3.7×10^{-7} mmHg @ 25°C. Practically insoluble in water; solubility = 0.085 ppm @ 20°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.
Potential Exposure: Fenvalerate is one of the most versatile synthetic pyrethroid insecticides. It is mostly used in agriculture and on cattle, but also in homes and gardens. It acts as a stomach poison against a wide variety of leaf and fruit eating such as bollworm fruit and shoot borers and aphids. Crops on which it is used include cotton, cauliflower, okra, vines and fruits. It is also used in public health and animal husbandry. It is effective against pests whose strains are resistant to organochlorine, organophosphorus, and carbamate insecticides. Not used in EU countries.
Incompatibilities: Incompatible with oxidizers, chlorates nitrates, peroxides, sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Moisture may cause hydrolysis or other forms of decomposition. Emulsifiable concentrate is corrosive.
Permissible Exposure Limits in Air:
NIOSH[2] IDLH = 5000 ppm
OSHA PEL: 5 milligram per cubic meter TWA
NIOSH REL: 5 milligram per cubic meter TWA
ACGIH TLV[1]: 5 milligram per cubic meter TWA
STEL set by HSE[33] = 10 milligram per cubic meter.
Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum.
Permissible Concentration in Water: State Drinking Water Guidelines: Arizona 180 μg/L. Runoff from spills or fire control may cause water pollution. Acceptable Daily Intake (ADI) = 0.02 mg/kg as pyrethroid.
Determination in Water: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum. Octanol−water coefficient: Log K_{ow} = > 4.0. Values above 3.0 are likely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Extra high—0.01433 ppb, MATC.
Routes of Entry: Inhalation, absorbed through the skin
Harmful Effects and Symptoms
Short-Term Exposure: Pyrethrins can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness, rhinorrhea (discharge of thin nasal mucous). Emulsifiable concentrate is corrosive to skin, eyes, and respiratory tract. LD_{50} (oral, rat) = < 100 mg/kg; LD_{50} (dermal, rabbit) = > 2.5 g/kg.
Long-Term Exposure: May cause tumors. High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic "pneumonia" can also occur with cough, chest pain, breathing difficulty and abnormal chest X-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Dermal contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse. Endocrine disruptor. Human toxicity (long term)[101]: Very low—175.00 ppb, Health Advisory.

Points of Attack: Respiratory system, skin, central nervous system

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Employees should be screened for history of certain medical conditions which might place the employee at increased risk from pyrethroid exposure. Chronic respiratory disease: In persons with chronic respiratory disease, especially asthma, the inhalation of pyrethroids might cause exacerbation of symptoms due to its sensitizing properties. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest X-ray if lung symptoms are present. Skin disease: Pyrethroids can cause dermatitis which may be allergic in nature. Persons with preexisting skin disorders may be more susceptible to the effects of this agent. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: *50 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece).*5000 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3349 Pyrethroid pesticide, solid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material. UN3352 Pyrethroid pesticide, liquid toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. *On a small fire:* use dry chemical, CO_2 or water spray. On a large fire: use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

EC Number: 238-484-2 [*Annex I Index No.*: 006-051-00-5]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human No Adequate Data; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987. United States Environmental Protection Agency Gene-Tox Program, Inconclusive: *B. subtilis* rec assay.

Hazard Alert: Poison, Possible thyroid effects. Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Supported

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U396

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R36/37/38; R50/53; R61; R62; R63; safety phrases: S2; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Ferbam is a combustible, odorless dark brown to black powder or granular solid. Molecular weight = 416.51; freezing/melting point = > 180°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Practically insoluble in water; solubility = 0.01%.

Potential Exposure: A dithiocarbamate. A potential danger to those involved in the production, formulation and application of this dithiocarbamate; used as a fungicide, rubber accelerator, and plastics prodegradant. Some dithiocarbamates have been used as rubber components.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine,

bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Heat alkalies (lime); moisture can cause decomposition. Decomposes on prolonged storage. Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of Dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides.

Permissible Exposure Limits in Air

NIOSH IDLH = 800 milligram per cubic meter

OSHA PEL: 15 milligram per cubic meter (total dust) TWA

NIOSH REL: 10 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter, inhalable fraction, TWA; not classifiable as a human carcinogen

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

DFG MAK: Danger of skin sensitization (dithiocarbamates used as rubber components).

Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 10 milligram per cubic meter, 1999; Belgium: TWA 10 milligram per cubic meter, 1993; Denmark: TWA 5 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; Norway: TWA 1 mg[Fe]/m^3, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Switzerland: MAK-W 10 milligram per cubic meter, 1999; Turkey: TWA 15 milligram per cubic meter, 1993; United Kingdom: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for ferbam in ambient air[60] ranging from 100 μ/m^3 (North Dakota) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L. State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L. Degradation produces ethylene thiourea.

Determination in Water: EPA EMSLC Method 630. The Determination of Dithiocarbamate Pesticides in Municipal and Industrial Wastewater by UV−VIS Spectrophotometry.

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Ferbam can affect you when breathed in. Breathing ferbam can irritate the nose and throat. Ferbam can cause skin and eye irritation. High exposure to ferbam may affect the nervous system and thyroid; dizziness, confusion, loss of coordination; seizures, paralysis, and coma.

Long-Term Exposure: Thyroid effects. Repeated or prolonged contact with skin may cause allergy with skin rash and itching. Exposure to ferbam may damage the kidneys and liver. Ferbam may damage the developing fetus.

Points of Attack: Thyroid function. Thyroid function (may cause goiter). Eyes, skin, respiratory system; gastrointestinal tract.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Kidney function tests. Liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 50 milligram per cubic meter*: Q_m (APF = 25) (any quarter-mask respirator). *Up to 100 milligram per cubic meter:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 250 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 500 milligram per cubic meter:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100); or SaT: Cf

* (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTiE* (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); * or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 800 milligram per cubic meter:* Sa:Pd,Pp (APF = 1000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown concentration or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Ferbam is incompatible with strong oxidizers (such as chlorine, bromine and fluorine). Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong bases; heat and moisture. Ferbam can decompose upon long-term storage.

Shipping: UN2771 Dithiocarbamate and Thiocarbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ferbam may burn, but does not readily ignite. Use dry chemical, CO_2, water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Ferbam is hydrolyzed by alkali and is unstable to moisture, lime and heat. Ferbam can be incinerated[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ferric Ammonium Citrate F:0140

Formula: $C_{12}H_{18}FeN_2O_{14}$; $FeC_6H_5O_7 \cdot (NH_4)_2C_6H_5O_7$

Synonyms: Ammonium ferric citrate; Ammonium iron(III) citrate; Citrato ferrico amonico (Spanish); FAC; Ferric ammonium citrate, brown; Ferric ammonium citrate, green; Iron(III) ammonium citrate; Soluble ferric citrate

CAS Registry Number: 1185-57-5

HSDB Number: 446

RTECS Number: GE7540000

DOT ID and ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 214-686-6

Regulatory Authority and Advisory Information

Hazard Alert: Combustible.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/37/38; safety phrases: S16; S26; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ferric ammonium citrate forms reddish brown flakes or grains, or a brownish-yellow powder. It has a slight ammonia odor. There is also a green form that is odorless. Molecular weight = 709.44; specific gravity (H_2O:1) = 1.8 @ 20°C; boiling point = decomposes. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Highly soluble in water.

Potential Exposure: Ferric ammonium citrate is used in blueprinting, photography, medical treatment; and as an animal food additive[101].

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 mg[Fe]/m^3 TWA

ACGIH TLV[1]: 1 mg[Fe]/m^3 TWA

PAC Ver. 28, no value in Ver. 29[138]

PAC-1: 5.4 milligram per cubic meter

PAC-2: 59 milligram per cubic meter

PAC-3: 360 milligram per cubic meter

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg [Fe]/m^3

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg [Fe]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ferric ammonium citrate can affect you when breathed in. Irritates the eyes, skin and respiratory tract. Ingestion can cause abdominal pain; diarrhea and vomiting. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever."

Long-Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye.

Points of Attack: Eyes, skin, respiratory system; liver, gastrointestinal tract.

Medical Surveillance: Liver function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours.

Note to Physician: In case of fume inhalation, treat pneumonitis. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics.

Note to physician: For severe poisoning *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light. Sources of ignition, such as smoking and open flames, are prohibited where ferric ammonium citrate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids containing ferric ammonium citrate in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ferric ammonium citrate may burn, but does not readily ignite. Thermal decomposition products may include ammonia and oxides of nitrogen, metal and carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

HSDB Number: 947

RTECS Number: LI8932000

DOT ID and ERG Number: UN3288/155 (trihydrate)

EC Number: 238-090-0 (triammonium trioxalatoferrate); 220-952-2 (triammonium iron(3+) trioxalate); 607-007-00-3 (trihydrate)

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Primary irritant (w/o allergic reaction), Corrosive, Reducing agent.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below) United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: (trihydrate) Hazard symbol: C, Xn; risk phrases: R21/22; R34; R36/37/38; safety phrases: S24; S25; S26; S27; S36/37/39; S45 (see Appendix 4)

Description: Ferric ammonium oxalate is a green crystalline, solid with a granular or salt-like appearance. Color depends on level of iron present. Molecular weight = 374.06; 428.06. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Ferric ammonium oxalate is used in photography and making blueprints.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 mg[Fe]/m^3 TWA

ACGIH TLV[1]: 1 mg[Fe]/m^3 TWA

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg [Fe]/m^3

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking

Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L.

Routes of Entry: Inhalation of dust, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ferric ammonium oxalate can affect you when breathed in. Irritates the eyes, skin and respiratory tract. Ingestion can cause abdominal pain; diarrhea and vomiting. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever;" irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea, vomiting.

Long-Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. May cause fibrosis of the lungs. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, lungs, gastrointestinal tract.

Medical Surveillance: Liver function tests. Kidney function tests. Lung function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ferric ammonium oxalate may burn, but does not readily ignite. Thermal decomposition products may include ammonia and oxides of nitrogen and carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Ferric Chloride F:0160

Formula: Cl_3Fe; $FeCl_3$
Synonyms: Anhydrous ferric chloride; Chlorure perrique (French); Cloruro ferrico anhidro (Spanish); Flores martis; Iron chloride; Iron(3+) chloride; Iron(III) chloride; Iron sesquichloride; Iron trichloride; Perchlorure de fer (French); PF etchant
CAS Registry Number: 7705-08-0
HSDB Number: 449
RTECS Number: LJ9100000
UN/NA & ERG Number: UN1773 (anhydrous)/157; UN2582 (solution)/154
EC Number: 231-729-4
Regulatory Authority and Advisory Information
Hazard Alert: Corrosive, Sensitization hazard; Suspected reprotoxic hazard, Suspected of causing genetic defects; FDA-over the counter drug; Known catalytic activity.
United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron; SMCL = 0.3 mg[Fe]/L as Iron; SMCL = 250 mg[Cl^-]/L as Chloride
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as Iron, water-soluble salts, n.o.s.
Hazard symbols, risk, & safety statements: Hazard symbol: C, Xn, Xi; risk phrases: R22; R34; R36/37/38; R41; R43; R62; R63; safety phrases: S26; S36/37/39; S41; S45(see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Ferric Chloride is a black-brown, dark-green, or black crystalline solid. Molecular weight = 162.20; specific gravity (H_2O:1) = 2.9 @ 20°C; boiling point = decomposes @ 315°C; freezing/melting point = (decomposes) 316°C; vapor pressure = 1 mmHg @ 194°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Soluble in water; solubility = 63%.
Potential Exposure: Iron chloride is used to treat sewage and industrial waste. It is also used as an etchant for photoengraving and rotogravure; in textiles; photography; as a disinfectant; as a feed additive.
Incompatibilities: Aqueous solutions are a strong acid. Violent reaction with bases, allyl chloride; sulfuric acid; water. Shock- and friction-sensitive explosive material forms with potassium, sodium and other active metals. Attacks metals when wet.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 1 mg[Fe]/m^3 TWA
ACGIH TLV[1]: 1 mg[Fe]/m^3 TWA
PAC Ver. 29[138]
PAC-1: 8.7 milligram per cubic meter
PAC-2: 30 milligram per cubic meter
PAC-3: 180 milligram per cubic meter
Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg[Fe]/m^3
Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].
Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L.
Routes of Entry: Inhalation of dust, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Ferric chloride is corrosive to the eyes, skin and respiratory tract. Eye contact may cause permanent damage. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever;" irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea, vomiting; Ingestion may cause severe irritation to mouth and throat, weak and rapid pulse; low blood-pressure; nausea, bloody vomiting; violent diarrhea; shock, dark purple skin discoloration, and coma. Animal studies suggest that death may result from 2.5 oz for a 150 lb person.
Long-Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones. Excessive intake of iron compounds may result in increased accumulation of iron in body, especially the liver, spleen and lymphatic system. Inhalation of iron dusts may cause mottling of the lung. Iron chloride may reduce the fertility of both males and females.
Points of Attack: Eyes, skin, respiratory system; liver, kidneys, lungs, gastrointestinal tract.
Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Liver function tests. Kidney function tests. Lung function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim*

ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Note to Physician: Gastric lavage should be performed followed by saline catharsis and anodyne. Administer deferoxamine, I.V. Watch for late stricture. Serum, plasma, or urinary iron levels may be employed to estimate amount ingested.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene and PVC are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powdered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplier-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Iron chloride must be stored in tightly closed containers to avoid contact with sulfuric acid, sodium, potassium, allyl chloride and water, since violent reactions occur and toxic vapors may be produced.

Shipping: UN1773 Ferric chloride, anhydrous, Hazard class: 8; Labels: 8-Corrosive material. UN2582 Ferric chloride, solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: *Solution:* Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Powder (anhydrous): Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agents suitable for surrounding fire. Thermal decomposition products may include hydrogen chloride and oxides of metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Neutralize with lime or soda ash and bury in an approved landfill[22].

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ferric nitrate is a pale violet, green, or grayish-white, odorless solid in lumpy crystals (like salt). Molecular weight = 241.86; specific gravity (H_2O:1) = 168 @ 21°C; boiling point = decomposes; freezing/melting point = 35°C; 47°C (nonhydrate). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 3, Oxidizer, ₩. Highly soluble in water, releases gaseous hydrogen chloride.

Potential Exposure: Ferric nitrate is used in textile dyeing, tanning, and weighting silk.

Incompatibilities: An oxidizer. Keep away from reducing agents, oxidizable materials and combustibles including metal powders, sulfur, and organic materials, combustibles, and easily oxidizable materials. Light sensitive. Aqueous solution is corrosive to metals.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 mg[Fe]/m^3 TWA

ACGIH TLV[1]: 1 mg[Fe]/m^3 TWA

PAC Ver. 29[138]

PAC-1: 13 milligram per cubic meter

PAC-2: 140 milligram per cubic meter

PAC-3: 850 milligram per cubic meter

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg[Fe]/m^3

Determination in Air: See NIOSH Analytical Method (IV) s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ferric nitrate can affect you when breathed in. Exposure can irritate the eyes, nose, throat, and skin. Large amounts of iron in the body can cause nausea, stomach pain; constipation, and black bowel movements. Ingestion can cause abdominal pain; diarrhea and vomiting. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever," irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea, vomiting.

Long-Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. May cause lung fibrosis. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system; liver, lungs, gastrointestinal tract.

Medical Surveillance: If illness occurs or overexposure is suspected, medical attention is recommended. Blood test for serum iron can detect excess body iron. If increased, consider liver function tests. Examination of the eyes. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use an NIOSH/MSHA or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from organic materials and other combustible materials or aluminum powder. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1466 Ferric nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include nitric acid and oxides of metal and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Suspected of causing genetic defects

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron; SMCL = 250 mg[SO_4^{-2}]/L as Sulfate

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as Iron, water-soluble salts, n.o.s.; 0.1%. as persulfate compounds.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R22; R23/24/25; R36/37; R41; R62; safety phrases: S26; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ferric Sulfate is a grayish-white powder or yellow lumpy crystals. Molecular weight = 399.88; specific gravity (H_2O:1) = 3.1 @ 20°C; boiling point = (decomposes); freezing/melting point = (decomposes) 480°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Slightly soluble in water.

Potential Exposure: This material is used in pigments, textile dyeing, water treatment; and metal pickling.

Incompatibilities: Hydrolyzed slowly in aqueous solution. Incompatible with magnesium, aluminum. Corrosive to copper and its alloys, mild and galvanized steel. Light sensitive.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 mg[Fe]/m^3 TWA

ACGIH TLV[1]: 1 mg[Fe]/m^3 TWA; 0.1 milligram per cubic meter TWA *as persulfates*

PAC Ver. 29[138]

PAC-1: 11 milligram per cubic meter

PAC-2: 120 milligram per cubic meter

PAC-3: 710 milligram per cubic meter

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg[Fe]/m^3

Determination in Air: See NIOSH Analytical Method (IV) s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation:* May cause irritation of nose and throat, coughing and difficulty in breathing. 0.075 milligram per cubic meter for 2 hours did not cause any change in breathing functions. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever," irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea, vomiting. *Skin:* Contact causes irritation. Remove promptly. *Eyes:* Contact causes irritation. *Ingestion:* May cause irritation of mouth and stomach, nausea, vomiting, diarrhea, drowsiness, liver damage; coma and death. The estimated lethal dose is 30 kg (1 oz).

Long-Term Exposure: Excessive intake of iron compounds may result in increased accumulations of iron in the body, especially the liver, spleen and lymphatic system. May cause nausea, vomiting, stomach pain; constipation, and black bowel movements. Inhalation of iron dusts may cause mottling of the lungs. Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system; liver, lungs, gastrointestinal tract.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for iron level (serum iron). Liver function tests. Lung function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4—12 hours following exposure: it may last less than 36 hours.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter* of iron, use an

NIOSH/MSHA or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light, moisture, aluminum, magnesium, copper and its alloys, zinc; galvanized and mild steels.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids containing ferric sulfate in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include oxides of sulfur and metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Treat with soda ash or dilute NaOH. Separate any precipitate and landfill. Flush solution to sewer[22].

Ferrocene F:0190

Formula: $C_{10}H_{10}Fe$

Synonyms: Biscyclopentadienyl iron; Di-2,4-cyclopentadien-1-yl iron; Dicyclopentadienyl iron; Iron bis(cyclopentadiene); Iron dicyclopentadienyl

CAS Registry Number: 102-54-5

HSDB Number: 2878

RTECS Number: LK0700000

UN/NA & ERG Number: UN1325 (flammable solid, organic)/133

EC Number: 203-039-3

Regulatory Authority and Advisory Information

Hazard Alert: Flammable solid, Possible risk of forming tumors, Suspected reprotoxic hazard, Organometallic.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%; category D1B, B4; On DSL List.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn, N; risk phrases: R10; R22; R51/53; R63; safety phrases: S22; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Ferrocene, a metallocene, is a bright orange salt-like crystals from alcohol. Camphor odor. Molecular weight = 186.05; boiling point = 249°C (sublimes); freezing/melting point = 173°C. Decomposes at 465°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 1. Insoluble in water.

Potential Exposure: Used as additive in fuel oil; antiknock agent in gasoline fuel; used in making rubber, silicone resins, high-temperature polymers and lubricants; intermediate for high-temperature polymers; as a smoke suppressant and catalyst

Incompatibilities: Violent reaction with ammonium perchlorate, tetranitromethane, mercury(II) nitrate. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Peroxomonosulfuric acid. Decomposes @ ≥465°C.

Permissible Exposure Limits in Air

OSHA PEL: 15 milligram per cubic meter TWA (total dust); 5 milligram per cubic meter TWA, respirable fraction

NIOSH REL: 10 milligram per cubic meter TWA (total dust); 5 milligram per cubic meter TWA, respirable fraction

ACGIH TLV[1]: 10 milligram per cubic meter TWA

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Australia: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Finland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter [skin], 1999; France: VME 10 milligram per cubic meter, 1999; Switzerland: MAK-W 10 milligram per cubic meter, 1999; United Kingdom: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter

Determination in Air: Use OSHA Analytical Method IDI-125G[58]. (Ferrocene is approximately 30% iron). See also NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102.

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L. EPA[32] has suggested a permissible ambient goal of 530 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory system. Eye contact can cause irritation. Dust may irritate the air passages, with possible cough, phlegm and tightness in the chest. Dicyclopentadienyl iron is classified as a slightly toxic material, but the toxicological properties have not been extensively investigated. LD_{50} (oral-rat) = 1320 mg/kg (slightly toxic).

Long-Term Exposure: There is limited evidence that this chemical may damage the testes. Repeated exposure to iron containing compounds can damage the liver and other body organs. Heavy or repeated exposure may cause mood changes; such as irritability. Repeated exposure may cause lung damage.

Repeated high exposures may cause mood changes; such as irritability. Dicyclopentadienyl iron may cause mutations. Exposure may affect liver and lung functions.

Points of Attack: Lungs. In animals: liver, red blood cell, testicular changes. (NIOSH)

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Liver function tests. Lung function tests. Complete blood count (CBC). Serum iron level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over *10 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. If while wearing a filter, cartridge or canister respirator, you can smell, taste, or otherwise detect Dicyclopentadienyl iron, or in the case of a full facepiece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. Be sure to consider all potential exposures in your work-place. You may need a combination of filters, profilers, cartridges, or canisters to protect against different forms of a chemical (such as vapor and mist) or against a mixture of chemicals. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, ammonium perchlorate, tetranitromethane, mercury(II) nitrate, and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1325 Flammable solids, organic, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dicyclopentadienyl iron is a flammable solid. Thermal decomposition products may include oxides of carbon and metal. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as Iron, water-soluble salts, n.o.s.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (anhydrous)

Description: Ferrous ammonium sulfate is a pale green or blue-green solid (powder or lumpy crystals). Molecular weight = 284.07; specific gravity (H_2O:1) = 1.87 @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Soluble in water.

Potential Exposure: This substance is used in photography, analytical chemistry and in dosimeters.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 milligram per cubic meter TWA

ACGIH TLV[1]: 1 milligram per cubic meter TWA

10045-89-3, PAC Ver. 29[138]

PAC-1: 50 milligram per cubic meter

PAC-2: 170.4 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg [Fe]/m^3

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC for iron in water bodies used for domestic purposes of 0.5 mg/L and a MAC in sea water bodies used for fishery purposes of 0.05 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ferrous ammonium sulfate can affect you when breathed in. Exposure can irritate the eyes, nose and throat. Large amounts of iron in the body can cause nausea and stomach pain; constipation, and black bowel movements. This is more common with swallowed iron. Repeated high exposures may damage the liver. Exposure may irritate the lungs.

Long-Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system; liver, gastrointestinal tract.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure has occurred, the following may be useful: blood tests for iron level (serum iron). Liver function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light.

Shipping: Not regulated.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids containing ferrous ammonium sulfate in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include ammonia and oxides of nitrogen, sulfur, carbon and metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Ferrous Ammonium Sulfate, Trenton, NJ (October 2001).

Ferrous Chloride F:0210

Formula: Cl_2Fe; $FeCl_2$

Synonyms: Iron(II) chloride (1:2); Iron dichloride; Iron protochloride; Lawrencite; Sulphate chloride tetrahydrate

CAS Registry Number: 7758-94-3

HSDB Number: 459

RTECS Number: NO5400000

UN/NA & ERG Number: UN1759 (solid)/154; UN1760 (solution)/154

EC Number: 231-843-4

Regulatory Authority and Advisory Information
United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron; SMCL = 250 mg [Cl^-]/L as Chloride
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as Iron, water-soluble salts, n.o.s.
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ferrous chloride is a pale greenish salt-like crystal or power. Molecular weight = 126.75; specific gravity (H_2O:1) = 3.16 @ 20°C; boiling point = 1012°C; freezing/melting point = 675.8°C; vapor pressure = 10 mmHg @ 700°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Soluble in water.

Potential Exposure: It is used in textile dyeing, metallurgy, the pharmaceutical industry and sewage treatment.

Incompatibilities: Solution attacks metals. Contact with ethylene oxide may initiate polymerization. Contact with potassium or sodium forms an impact-sensitive material.

Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: 1 milligram per cubic meter TWA
ACGIH TLV[1]: 1 milligram per cubic meter TWA
PAC Ver. 29[138]
PAC-1: 6.8 milligram per cubic meter
PAC-2: 76 milligram per cubic meter
PAC-3: 460 milligram per cubic meter
Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg[Fe]/m^3

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC for iron in water bodies used for domestic purposes of 0.5 mg/L and a MAC in sea water bodies used for fishery purposes of 0.05 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ferrous chloride can affect you when breathed in. Repeated or high level exposures may lead to too much iron in the body and possible liver damage. Exposure can irritate the nose and throat. Ferrous chloride is a corrosive chemical and contact can irritate and may burn the eyes and skin.

Long-Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system; liver, gastrointestinal tract.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: serum iron test. Liver function test. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potassium, sodium metals, or ethylene oxide.

Shipping: UN1759 Ferrous chloride, solid, Hazard class: 8; Labels: 8-Corrosive material. UN1760 Ferrous chloride, solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include hydrogen chloride and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Fipronil F:0243

Formula: $C_{12}H_4Cl_2F_6N_4OS$

Synonyms: 5-Amino-1-(2,6-dichloro-4-(trifluoromethyl) phenyl)-4-(1,*R,S*)-(trifluoromethyl)sulfinyl-; (±)-5-Amino-1-(2,6-dichloro-α,α,α-trifluoro-*p*-tolyl)-4-trifluoromethylsulfinylpyrazole-3-carbonitrile; BES 602; Ceasefire; Chipco; Combat; Frontline; Mb-46030; H&G; Icon; Maxforce ant station; Maxforce roach station; 1*H*-Pyrazole-3-carbonitrile, 5-amino-1-(2,6-dichloro-4-(trifluoromethyl) phenyl)-4-[(trifluoromethyl)sulfinyl]-; Regency sofion; Regent; Regent 500-FS; Termidor L VI-NIL

CAS Number: 120068-37-3

HSDB Number: 7051

RTECS Number: UQ4430250

UN/NA & ERG Number: UN2588 (Pesticide, solid, poisonous, n.o.s.)/151; UN2902 (Pesticide, liquid, poisonous, n.o.s.)/151

EC Number: [*Annex I Index No.:* 608-055-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen

Hazard Alert: Poison, Possible endocrine disruptor.

EPA ADI: EPA Oral reference dose (RfD) = 2.0 × 10 mg/kg/day based on the NOAEL for chronic toxicity (0.500 ppm or 0.019 mg/kg/day).

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/24/25; R48/25; R50/53; safety phrases: S1/2; S24; S28; S36/37; S38; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: White crystalline solid. Molecular weight = 437.16; specific gravity (H_2O:1) = 1.5−1.7; boiling point = (decomposes); freezing/melting point = 201°C; vapor pressure = 3×10^{-8} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Low solubility in water; solubility = 1.9 ppm.

Potential Exposure: Pyrazole/phenylpyrazole/organofluorine insecticide; veterinary medicine. Fipronil was introduced into the United States in 1996 for use in animal health and indoor pest control. It is the constituent of many products for controlling a wide spectrum of domestic animal and residential pests. Banned for use in EU.

Determination in Water: Octanol−water coefficient: Log K_{ow} = > 3.5. Values above 3.0 are likely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Extra high—0.31368 ppb, MATC.

Routes of Entry: Inhalation, dermal and eye contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic. Contact with eyes or skin may cause irritation or injury. Harmful if swallowed. LD_{50} (oral, rat) = 100 mg/kg; LD_{50} (dermal, rabbit) = 354 mg/kg. Fipronil-desulfinyl (breakdown product): LD_{50} (oral, rat) = 15 (female) − 18 (male) mg/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. Kidney, liver and thyroid toxin. Neurotoxin. Animal tests indicated that this chemical may cause reproductive and fetal effects. Bioconcentrates in tissues. Human toxicity (long term)[101]: Extra high—0.14 ppb, Health Advisory.

Points of Attack: Thyroid, bones, kidney, liver, testicular. Central nervous system.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring. Examination of the nervous system. Liver and kidney function tests. More than light alcohol consumption may exacerbate liver damage. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated.

First Aid: Give artificial respiration if victim is not breathing. *Do not* use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2902 Pesticide, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon, hydrogen chloride, and hydrogen fluoride. *On a small fire:* use dry chemical, CO_2 or water spray. On a large fire: use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods.

Fluazifop-butyl F:0244

Formula: $C_{19}H_{20}F_3NO_4$

Synonyms: Butyl(*RS*)-2-[4-((5-(trifluoromethyl)-2-pyridinyl)oxy)phenoxy]propanoate; (±)-Butyl-2-[4-(((5-trifluoromethyl)-2-pyridinyl)oxy)phenoxy]propanoate; Butyl 2-[4-((5-(trifluoromethyl)-2-pyridyl)oxy)phenoxy]propionate]; Caswell No. 460C; Fusilade; Fusilade max (*p*-butyl); Fusion; Grass-b-Gone; Greencrop; Hache uno super; Horizon; ICI-A0009; Oneside; Oneside EC; Ornamec; PP 009; Propanoic acid, 2-[4-((5-(trifluoromethyl)-2-pyridinyl) oxy)phenoxy]-,butyl ester; Propionic acid, 2-[*p*-((5-(trifluoromethyl)-2-pyridyl)oxy)phenoxy]-, butylester; (*RS*)-2-[4-(5-Trifluoromethyl-2-pyridyloxy)]-phenoxy]propanoic acid, butyl ester; 2-[4-((5-(Trifluoromethyl)-2-pyridinyl) oxy)-phenoxy]propanoic acid, butyl ester; SL-236; TF 1169; TS-7236; Tornado

CAS Number: 69806-50-4; 79241-46-6 (*p*-butyl isomer)

HSDB Number: 6644; 5815 (Fluazifop-*p*-butyl)

RTECS Number: UA3000000

UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 274-125-6607-304-00-8

Regulatory Authority and Advisory Information

California Prop.65: Listed; Developmental toxin

Hazard Alert: Poison, Suspected reprotoxic hazard, Possible sensitization hazard (skin), Developmental toxin (TRI), Environmental hazard.

California EPAAB2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides

EPCRA Section 313 Form R de minimus concentration reporting level: 1.0% as Fluazifop-butyl

Hazardous to aquatic life or environment, with possible long-lasting effects [291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard Codes: T, N, Xi; Risk phrases: R43; R50/53; R61; R63; Safety phrases: S29; S53; S45; S60; S61 (see Appendix 4); *P-isomer*: Hazard Codes: T, N, Xi; Risk phrases: R43; R63; Safety phrases: S2; S29/35; S36/37; S46; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Pale yellow liquid. Odorless. Molecular weight = 383.37; specific gravity (H_2O:1) = 1.214; boiling point = 164.5°C; (*p*-isomer decomposes before boiling); freezing/melting point = 4.8°C; 13°C; (P-isomer is <1°C); vapor pressure = 4.1×10^{-7} mmHg @ 20°C; 0.055 mmHg @ 20°C; flash point = 37°C. Slightly soluble in water (both isomers); solubility = <1 mg/L @ 25°C.

Potential Exposure: Fluazifop-butyl is a selective post-emergence aryloxyphenoxypropionate/organofluorine herbicide. Its principal uses In California is on rights-of-way, landscapes, almonds, cotton, and outdoor container nurseries.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = > 4.5$. Values above 3.0 are likely to bioaccumulate in marine organisms. According to Fluoride Action Network Pesticide Project, "the potential for bioconcentration in aquatic organisms is very high. Highly toxic to zooplankton." Fish toxicity (threshold)[101]: Intermediate—62.61862 ppb, MATC.

Routes of Entry: Inhalation, ingestion, absorbed through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years.

LD_{50} (oral, rat) = 2000−4000 + mg/kg; LD_{50} (dermal, rabbit) = > 2 g/kg. Both isomers have low toxicity; the P-isomer is slightly less toxic.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. May cause reproductive and fetal effects. May cause skin sensitization. Human toxicity (long term)[101]: Low—70.00 ppb, Health Advisory

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidney, reproductive system, bones. *P-isomer:* Sensitization hazard (skin), Kidney, spleen and liver toxin, May cause eye cataracts.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Exam of the nervous system. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Stay upwind; keep out of low areas. Ventilate area of spill or leak. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Fire Extinguishing: Thermal decomposition products may include fluorine and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Fire Extinguishing: Thermal decomposition products may include fluorine and nitrogen oxides. Use dry chemical, carbon dioxide; or alcohol-resistant foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Ferrous Sulfate F:0220

Formula: FeO_4S; $FeSO_4$

Synonyms: Copperas; Duretter; Duroferon; Exsiccated sulphate sulfate; Exsiccated sulphate; Feosol; Feospan; Fer-In-Sol; Ferralyn; Ferro-gradumet; Ferrosulfat (German); Ferrosulfate; Ferrosulphate; Ferro-Theron; Fersolate; Green vitriol iron monosulfate; Iron protosulfate; Iron sulfate (1:1); Iron(2+) sulfate; Iron(2+) sulfate (1:1); Iron(II) sulfate; Iron vitriol; Irospan; Irosul; Slow-Fe; Sulfato ferroso (Spanish); Sulfuric acid iron salt (1:1); Sulfuric acid, iron (2+) salt (1:1); Sulfuric acid, iron(II) salt (1:1); Sulphate sulphate (1:1); Sulsulphate

CAS Registry Number: 7720-78-7 (anhydrous); 7782-63-0 (heptahydrate)

HSDB Number: 465

RTECS Number: NO8500000

UN/NA & ERG Number: Not regulated.

EC Number: 231-753-5 [*Annex I Index No.:* 026-003-00-7]; [*Annex I Index No.:* 026-003-01-4] (heptahydrate)

Regulatory Authority and Advisory Information

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron; SMCL = 250 mg[SO_4^{-2}]/L as Sulfate

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

European/International Regulations (*includes heptahydrate*): Hazard symbol: Xn; risk phrases: R22; R36/38; safety phrases: S2; S41; S46 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ferrous sulfate is a greenish or yellowish solid in fine or lumpy crystals. Molecular weight = 151.91; freezing/melting point = 65°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 1. Slowly soluble in water.

Potential Exposure: It is used as a fertilizer, food or feed additive; and in herbicides; process engraving; dyeing, and water treatment. A byproduct of various chemical and metal treating operations.

Incompatibilities: Aqueous solution is acidic. Contact with alkalies form iron. Keep away from alkalies, soluble carbonates; gold and silver salts; lead acetate; lime water, potassium iodide; potassium and sodium tartrate; sodium borate; tannin.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 1 milligram per cubic meter TWA

ACGIH TLV[1]: 1 milligram per cubic meter TWA

PAC Ver. 29[138]

7720-78-7, anhydrous

PAC-1: 8.2 milligram per cubic meter

PAC-2: 41 milligram per cubic meter

PAC-3: 250 milligram per cubic meter

7782-63-0, heptahydrate

PAC-1: 15 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 990 milligram per cubic meter

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 mg [Fe]/m^3

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G[58].

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Ferrous sulfate can affect you when breathed in. Irritates the eyes, skin and respiratory tract. Ingestion: Less than 5 g (1/6 oz) can cause drowsiness, irritability, weakness, abdominal pain; nausea, vomiting and black, bloody stools. Delayed symptoms include fluid in the lungs, liver abnormalities; shock, coma; intestinal blockage and breakdown of the stomach and intestinal lining. Death has resulted from ingestion of less than an ounce.

Long-Term Exposure: Excessive intake of iron compounds may result in increased accumulation of iron in body, especially the liver, spleen and lymphatic system. Inhalation of iron dusts may cause mottling of the lungs. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system; liver, gastrointestinal tract.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: serum iron test. Liver function test. Kidney function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Gastric lavage with large amounts of 5% sodium phosphate or water. Follow this with a large amount of 1% sodium bicarbonate over a 3-hour period.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 milligram per cubic meter*, use an NIOSH/MSHA or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis.

Agricultural chemical

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Thermal decomposition products may include sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Ferrovanadium Dust F:0230

Formula: FeV

Synonyms: Ferro "V"

CAS Registry Number: 12604-58-9

HSDB Number: 6911 as vanadium compounds

RTECS Number: LK2900000

Regulatory Authority and Advisory Information

An OSHA specifically regulated substance.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

WGK[100] (German Aquatic Hazard Class): (Vanadium and compounds) 3-Severe hazard to water, unless water solubility is <4 μg[V]/L.

Description: Ferrovanadium, a noncombustible solid; the dust may be an explosion hazard. It consists of dark, odorless solid particles (*particulate*): dispersed in air. An alloy having the composition of 50%−80% vanadium with iron, carbon, and trace silicon, manganese, chromium, nickel, etc. Molecular weight = 106.8; freezing/melting point = 1482−1521°C; minimum explosive concentration = 1.3 g/m^3[77]. Insoluble in water.

Potential Exposure: Ferrovanadium is added to steel to produce fineness of grain, toughness, torsion properties; and resistance to high temperatures.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 milligram per cubic meter

OSHA PEL: 1 mg[V]/m^3 TWA

NIOSH REL: 1 mg[V]/m^3 TWA; 3 mg[V]/m^3 STEL [REL applies to ferrovanadium, vanadium metal, and vanadium carbide.]

ACGIH TLV[1]: 1 mg[V]/m^3 TWA; 3 milligram per cubic meter STEL

7439-89-6 as Iron for reference

NIOSH IDLH = 2500 mg[Fe]/m^3

OSHA PEL: 10 mg[Fe]/m^3 TWA (dust and fume)

ACGIH TLV[1]: 5 mg[Fe]/m^3 (vapor, dust) TWA; not classifiable as a human carcinogen

DFG MAK: 1.5 mg[Fe]/m^3 respirable fraction

No PAC available for ferrovanadium.

DFG MAK: 1 mg[V]/m^3, inhalable fraction; Carcinogen Category: 2; Germ cell mutagen group: 2 (DFG 2005).

Australia: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter (*dust*), 1993; Austria: MAK 1 milligram per cubic meter, 1999; Belgium: TWA 1 milligram per cubic meter; STEL 3 milligram per cubic meter (*dust*), 1993; Denmark: TWA 1 milligram per cubic meter (*dust*), 1999; Finland: TWA 0.5 milligram per cubic meter (*dust*), 1999; France: VM 0.05 mg[V_2O_5]/m^3, 1999; Japan: 1 milligram per cubic meter (*dust*), 1999; Norway: TWA 1 milligram per cubic meter, 1999; the Philippines: TWA 1 milligram per cubic meter (*dust*), 1993; Russia: STEL 1 milligram per cubic meter (*dust*), 1993; Switzerland: MAK-W 1 milligram per cubic meter (*dust*), 1999; Turkey: TWA 1 milligram per cubic meter (*dust*), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 3 milligram per cubic meter. Several states have set guidelines or standards for ferrovanadium dust in ambient air[60] ranging from 10.0−30.0 μ/m^3 (North Dakota) to 16.0 μ/m^3 (Virginia) 20.0 μ/m^3 (Connecticut) to 238.0 μ/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Methods #ID-121, #ID-125G.

Permissible Concentration in Water: *Iron*: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L. *Vanadium*: State Drinking Water Guidelines: California: 50 μg[V]/L Arizona 7 μg[V]/L; Florida: 49 μg[V]/L; Minnesota: 50 μg[V]/L; Wisconsin: 30 μg[V]/L. Runoff from spills or fire control may cause water.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of eyes and respiratory system. Inhalation can cause irritation with coughing and wheezing.

Long-Term Exposure: Repeated exposure can cause bronchitis, pneumonitis, with cough, phlegm and/or shortness of breath.

Points of Attack: Respiratory system, eyes.

Medical Surveillance: Chest X-ray; pulmonary function tests. An OSHA regulated substance. Medical tests: Chest X-ray; pulmonary function tests. See NIOSH Publication No. 2005-110, December 2004.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning *do not* use BAL, dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 5 milligram per cubic meter*: Q_m (APF = 25) (any quarter-mask respirator). *Up to 10 milligram per cubic meter:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100. *Up to 25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); * or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter).* *up to 50 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); * or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); * or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown concentration or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Dust is an explosion hazard. Prior to working with this material, all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible solid, but dust may be an explosion hazard. Use extinguishers suitable for metal fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal in a sanitary landfill.

Fibrous Glass F:0240

Synonyms: Fiber Glass; Fiberglass; Glass fibers; Glass wool; Manmade mineral fibers; Mineral wool fiber; Synthetic vitreous fibers; Slag wool

CAS Registry Number: 65997-17-3; *(alt.)* 94551-77-6

RTECS Number: LK3651000

EC Number: 266-046-0

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen: [certain glass wool fibers (inhalable)]; IARC (special purpose glass fibers): Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B (*glass filament; glass wool fibers; rock wool fibers*) Human No Adequate Data; Animal Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3

California Proposition 65 Chemical (glasswool fibers, airborne particles of respirable size): Cancer 7/1/1990.

Hazard Alert: Possible risk of forming tumors, Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, T; risk phrases: R36/37/38; R49; safety phrases: S22; S24/25; S26; S36; S45; S53; S41 (see Appendix 4)

Description: Fibrous glass is the name for a manufactured fiber in which the fiber-forming substance is glass. Glasses are a class of materials made from silicon dioxide with oxides of various metals and other elements, which solidify from the molten state without crystallization. Typically, glass filaments $>3\,\mu m$ in diameter or glass "wool" with diameters down to $0.05\,\mu m$ & length $>1\,\mu m$. A fiber is considered to be a particle with a length-to-diameter ratio of 3:1 or greater. The volume of small diameter fiber production has not been determined. Fibers with diameters less than $1\,\mu m$ are estimated to comprise less than 1% of the fibrous glass market. Specific gravity (H_2O:1) = 2.5. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: The major uses of fibrous glass are in thermal, electrical, and acoustical insulation; weatherproofing, plastic reinforcement; filtration media; and in structural and textile materials.

Permissible Exposure Limits in Air

OSHA PEL: 15 milligram per cubic meter (total dust) TWA; 5 milligram per cubic meter TWA, respirable fraction

NIOSH REL: 5 milligram per cubic meter total fibrous glass or 3 fibers/cc TWA (fibers with diameter $\leq 3.5\,\mu m$ diameter; $\geq 10\,\mu m$. In length).

ACGIH TLV[1] (*synthetic vitreous fibers, continuous filament glass fibers; synthetic vitreous fibers, glass wool fibers; synthetic vitreous fibers, special purpose glass fibers)*: 1 f/cc, respirable fibers. confirmed animal carcinogen with unknown relevance to humans.

continuous filament glass fibers or *special purpose glass fibers*: 1 f/cc, respirable fibers 1 f/cc, respirable fibers length $>5\,\mu m$; aspect ratio $\geq 3{:}1$, as determined by the membrane filter method @ 400−450 × magnification (4-mm objective), using phase-contrast illumination; not classifiable as a human carcinogen

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

North Dakota[60] has set a guideline for fibrous glass dust in ambient air of 0.10 milligram per cubic meter.

Determination in Air: Use NIOSH Analytical Method (IV) #7400, asbestos and Other Fibers.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Different dimensions of fibrous glass will produce different biologic effects. Large diameter (greater than $3.5\,\mu m$) glass fibers have been found to cause skin, eye, and upper respiratory tract irritation; a relatively low frequency of fibrotic changes; and a very slight indication of fan excess mortality due to nonmalignant respiratory disease. Smaller diameter (less than $3.5\,\mu m$) fibrous glass has not been conclusively related to health effects in humans but glass fibers of this dimension have only been regularly produced since the 1960s. Smaller diameter fibers have the ability to penetrate to the alveoli. This potential is cause for concern and the primary reason that fibers $3.5\,\mu m$ or smaller are subject to special controls. Experimental studies in animals have demonstrated carcinogenic effects with the long (greater than $10\,\mu m$) and thin fibers (usually less than $1\,\mu m$ in diameter). However, these studies were performed by implanting fibrous glass in the pleural or peritoneal cavities. The data from studies with these routes of exposure cannot be directly extrapolated to conditions of human exposure. On the basis of available information, NIOSH does not consider fibrous glass to be a substance that produces cancer as a result of occupational exposure. The data on which to base this conclusion are limited. Fibrous glass does not appear to possess the same potential as asbestos or for causing, health hazard. Glass fibers are not usually of the fine submicron diameters as are asbestos fibers, and the concentrations of glass fibers in work-place air are generally orders of magnitude less than for asbestos. In one study, glass fibers were found to be cleared from the lungs more readily than asbestos.

Short-Term Exposure: Irritates eyes, skin, nose, throat. Inhalation can cause dyspnea (breathing difficulty)

Long-Term Exposure: A suspected carcinogen, but there is no consistent evidence of chronic health effects in exposed workers.

Points of Attack: Eyes, skin, respiratory system

Medical Surveillance: NIOSH recommends that workers subject to fibrous glass exposure have comprehensive preplacement medical examinations with emphasis on skin susceptibility and prior exposure in dusty trades. Subsequent annual examinations should give attention to the skin and respiratory system with attention to pulmonary function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, and move to fresh air.

Personal Protective Methods: Protective clothing shall be worn to prevent fibrous glass contact with skin especially hands, arms, neck, and underarms. Safety goggles or face shields and goggles shall be worn during tear-out or blowing operations; or when applying fibrous glass materials overhead. They should be used in all areas where there is a likelihood that airborne glass fibers may contact the eyes. Engineering controls should be used wherever feasible to maintain fibrous glass concentrations at or below the prescribed limits. Respirators should only be used when engineering controls are not feasible; for example, in certain nonstationary operations where permanent controls are not feasible.

Respirator Selection: NIOSH: *up to* $5 \times REL$: Q_m (APF = 25) (any quarter-mask respirator). *Up to* $10 \times REL$: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100); or Sa (APF = 10) (any supplied-air respirator). *Up to 25 × REL:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 50 × REL*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1000 × REL:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000): SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. *Dust only*: Color code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage.

Shipping: Not a regulated substance.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete.

Fire Extinguishing: Noncombustible fibers. Use extinguisher suitable for surrounding fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Fibrous glass waste and scrap should be collected and disposed of in a manner which will minimize its dispersal into the atmosphere. Emphasis should be placed on covering waste containers; proper storage of materials; and collection of fibrous glass dust. Clean-up of fibrous glass dust should be performed using vacuum cleaners or wet cleaning methods. Dry sweeping should not be performed.

Fluenetil F:0250

Formula: $C_{16}H_{15}FO_2$

Synonyms: (1,1′-Biphenyl)-4-acetic acid, 2-fluoroethyl ester; 4-Biphenylacetic acid, 2-fluoroethyl ester; Fluenyl; β-Fluorethyl 4-biphenylacetate; Lambrol

CAS Registry Number: 4301-50-2

HSDB Number: 6437

RTECS Number: DV8335000

UN/NA & ERG Number: UN2588 (Pesticides, solid, toxic, n.o.s.)/151; UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: [*Annex I Index No.:* 607-078-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Highly toxic (all routes)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R23/24/25; R27/28; R50; safety phrases: S1/2; S28; S36/37; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Fluenetil is a crystalline solid. Molecular weight = 258.31. Boiling point = ~178°C; freezing/melting point = 61°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0.

Potential Exposure: This material has been used as an acaricide and insecticide. Its main use was as a dormant spray for orchard fruit. It is no longer made or registered as a pesticide in the U.S.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Moisture may cause material to hydrolyze. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.55 milligram per cubic meter

PAC-2: 6 milligram per cubic meter

PAC-3: 9.1 milligram per cubic meter

Routes of Entry: Ingestion, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Fluenetil is highly toxic. Fatal if ingested or via skin contact. Inhalation may cause pulmonary edema, a medical emergency that can be fatal. LD_{50} = (oral-rat) < 10 mg/kg.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from nitrates and moisture.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other non-combustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a combustible solid. Thermal decomposition products may include fluorine. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Flumetsulam F:0255

Formula: $C_{12}H_9F_2N_5O_2S$

Synonyms: (1,2,4)Triazolo(1,5-α)pyrimidine-2-sulfonamide, *N*-(2,6-difluorophenyl)-5-methyl-; *N*-(2,6-Difluorophenyl)-5-methyl-(1,2,4)triazolo-(1,5-α)pyrimidine-2-sulfonamide; accent; broadstrike (flumetsulam plus metolachlor); DE-498; Frontrow, (cloransulam-methyl + flumetsulam); Hornet, (flumetsulam + clopyralid); NAF-9 (flumetsulam + metolachlor); NAF-2 (flumetsulam + metolachlor); Python; Scorpion; XRD-498; XRM-5313 (flumetsulam plus trifluralin); XRM-5019 herbicide

CAS Number: 98967-40-9

RTECS Number: RZ61275000

UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: Not assigned

Regulatory Authority and Advisory Information

Carcinogenicity: EPA Group E, Evidence of noncarcinogenicity for humans

Hazard Alert: Poison (EPA Toxicity Class III, Caution, Slightly toxic). Listed for Tier 1 screening as an endocrine disruptor[88].

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn; risk phrases: R20; R36/37/38; R57; safety phrases: S41; S61 (see Appendix 4)

Description: Flumetsulam is a colorless liquid which does not exist as a free, pure substance. Used as an aqueous solution. Molecular weight = 325.3; specific gravity (H_2O:1) = 1.768 @ 25°C; boiling point = 130°C (decomposes); freezing/melting point = 251−253°C; flash point = > 95°C. Hazard identification (based on NFPA-704M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water; solubility = 50 mg/L.

Potential Exposure: Ttriazolopyrimidine/sulfonanilide herbicide

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log K_{ow} = < 1.0. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided. May be harmful if swallowed. LD_{50} (oral, rat) = > 5000 mg/kg; LD_{50} (dermal, rabbit) = > 2000 mg/kg.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests if necessary[30].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Respirator Selection: Where the neat test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e. organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO_2 and a high efficiency particulate filter)[193]

Storage: Color code—Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is partially combustible; it may burn but does not easily ignite; may support combustion at high temperatures. Thermal decomposition products may include hydrogen fluoride and oxides of nitrogen, carbon, sulfur. Use dry chemical powder extinguishers, foam, carbon dioxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. If this material cannot be disposed of according to label instructions, it may be dissolved or mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Noncombustible containers should be crushed and buried under more than 40 cm of soil[30].

EC Number: 240-898-3 [*Annex I Index No.:* 009-010-00-X]

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2 mg[F]/L, as fluorides.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R34; safety phrases: S1/2; S26; S27; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Fluoboric acid is a colorless liquid which does not exist as a free, pure substance. Used as an aqueous solution. Molecular weight = 87.82; boiling point = 130°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Used as a catalyst for acetal synthesis and cellulose esters; a metal surface cleaning agent; an aluminum electrolytic finishing agent; a stripping solution for the removal of solder and plated metals; and an intermediate in making fluoroborate salt.

Incompatibilities: A strong acid. Reacts violently with chemically active metals; strong bases, releasing flammable hydrogen gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 8.7 milligram per cubic meter

PAC-2: 97 milligram per cubic meter

PAC-3: 580 milligram per cubic meter

as inorganic fluoride

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg [F]/m^3, 15 min. Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Several states have set guidelines or standards for fluorine in ambient air[60] ranging from 0 (North Carolina) to 4.0 μ/m^3 (Connecticut) to 6.7 μ/m^3 (New York) to 20.0 μ/m^3 (Florida) to 30.0 μ/m^3 (Virginia) to 20.0−40.0 μ/m^3 (North Dakota) to 48.0 μ/m^3 (Nevada).

Determination in Air: No tests available.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking

Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Highly corrosive. Contact can cause severe skin burns and eye irritation and burns with possible eye damage. Inhalation can irritate the lungs, causing coughing and shortness of breath. High exposure can cause headache, weakness, convulsions, collapse and death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated exposure can cause nausea, vomiting, diarrhea, loss of appetite and weight; hair loss; skin rash; and bone and teeth changes (fluorosis). May cause kidney damage, anemia; and lung irritation with the possible development of bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system; kidneys, blood.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10) *[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25) $^{*+}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. $^{+}$May need acid gas sorbent.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from chemically active metals; and strong bases. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1775 Fluoroboric acid, Hazard class: 8; Labels: 8-Corrosive material.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical powder extinguishers. Thermal decomposition products may include hydrogen fluoride, fluorine, and boron oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 218-500-4
Regulatory Authority and Advisory Information
Carcinogenicity: IARC: Human No Adequate Data; Animal Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3
Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Environmental hazard, Agricultural chemical.
EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%.
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: N, Xn; risk phrases: R22; R33; R40; R51/53; R62; R64; safety phrases: S29; S36/37; S41; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Fluometuron is a white crystalline solid often used in liquid solution that may be flammable. Molecular weight = 232.23; freezing/melting point = 163−165°C; vapor pressure = 9.4×10^{-7} mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Slightly soluble in water.
Potential Exposure: This material is used as a herbicide.
Incompatibilities: Liquid solutions are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.
Permissible Exposure Limits in Air
No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.
Permissible Concentration in Water: A no-observed-adverse-effect-level (NOAEL) of 0.0125 mg/kg/day has been calculated by EPA. On this basis a long-term health advisory of 5.3 mg/L and a lifetime health advisory of 0.09 mg/L have been calculated. *Fluoride ion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.
Determination in Water: Fish Tox = 77.05449000 ppb (INTERMEDIATE). Octanol−water coefficient: Log K_{ow} = 2.3. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, dermal contact.
Harmful Effects and Symptoms
Short-Term Exposure: Contact can cause eye and skin irritation. Inhalation can irritate the respiratory tract.

Symptoms of exposure include increased leukocyte content in circulation of blood. The material is a mild cholinesterase inhibitor. LD_{50} (oral-rat) = 6400 mg/kg (insignificantly toxic). Human Tox = 7.00000 ppb (HIGH)

Long-Term Exposure: May cause skin allergy. Mild cholinesterase inhibitor; cumulative effect is possible. Repeated exposure may cause changes in the red blood cell count. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Liver function tests. CBC. Evaluation by a qualified allergist.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Consult a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the airway is open, lay on side and keep head lower than body and transport immediately to medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Do not induce vomiting without a physician's advice.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2767 Phenyl urea pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with 60%−70% acetone and avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride and oxides of nitrogen and carbon. *Dry material:* Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include hydrogen fluoride and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Combustible solution: Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xn; risk statements: R20; R22; R23/24/25; R36/37/38; R38; R39/23/24/25; R40; R41; R50/53; R51/53; R65; R67; safety statements: S7; S16; S23; S24/25; S26; S29/35; S36/37; S37/39; S45; S50/53; S60; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Fluoranthene is a polycyclic hydrocarbon and a colorless crystalline solid. Molecular weight = 202.25; boiling point = 384°C; freezing/melting point = 110°C; vapor pressure = 1.25 mmHg @ 0°C. Flash point = 195°C. Hazard identification (based on NFPA-704 M Rating System): Health 0, flammability 1, reactivity 0. Virtually insoluble in water.

Potential Exposure: Fluoranthene, a PAH, is produced from the pyrolytic processing of organic raw materials, such as coal and petroleum at high temperatures. It is also known to occur naturally as a product of plant biosynthesis. Fluoranthene is ubiquitous in the environment and has been detected in United States air; in foreign and domestic drinking waters and in food-stuffs. It is also contained in cigarette smoke. Individuals living in areas which are heavily industrialized; and in which large amounts of fossil fuels are burned, would be expected to have greatest exposure from ambient sources of fluoranthene. In addition, certain occupations e.g., coke oven workers, steelworkers, roofers, automobile mechanics) would also be expected to have elevated levels of exposure relative to the general population. Exposure to fluoranthene will be considerably increased among tobacco smokers or those who are exposed to smokers in closed environments (i.e., indoors).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Compound can react exothermically with bases and with diazo compounds. Substitution at the benzene nucleus occurs by halogenation (acid catalyst), nitration, sulfonation, and the Friedel−Crafts reaction[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 8.2 milligram per cubic meter

PAC-2: 90 milligram per cubic meter

PAC-3: 400 milligram per cubic meter

DFG MAK: Category 1, human carcinogen

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, Polycyclic aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: State Drinking Water Guidelines: Florida 280 μg/L; Minnesota 300 μg/L; Wisconsin 400 μg/L.

Determination in Water: Methylene chloride extraction followed by high pressure liquid chromatography with fluorescence as UV detection; or gas chromatography (EPA Method 610), or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Long-Term Exposure: There is concern about the toxicity of fluoranthene because it is widespread in the human environment and belongs to a class of compounds (PAHs) that contain numerous potent carcinogens. Experimentally, fluoranthene does not exhibit properties of a mutagen or primary carcinogen but it is a potent cocarciongen. In the laboratory, fluoranthene has also demonstrated toxicity to various freshwater and marine organisms. This finding, coupled with the cocarcinogenic properties of the compound, points out the need to protect humans and aquatic organisms from the potential hazards associated with fluoranthene in water.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, ammonium perchlorate, tetranitromethane, mercury(II) nitrate, and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1325 Flammable solids, organic, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Contain and isolate spill to limit spread. Construct clay/bentonite swale to divert uncontaminated portion of watershed. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N, Xi, Xn; risk phrases: R40; R11; R20; R23/24/25; R36/37/38/39; R39/23/24/25; R41; R50/53; R59; R65; R67; safety phrases: S7; S16; S22; S24/25; S26; S27; S29; S33; S36/37/39; S45; S60; S61; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Fluorene, when pure, is found as dazzling-white flakes or small, crystalline plates. It is fluorescent when impure. Polycyclic aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Molecular weight = 166.22; specific gravity (H_2O:1) = 1.2 @ 0°C; boiling point = 295°C (decomposes); freezing/melting point = 115°C; vapor pressure = 7.5 mmHg @ 137.4°C; flash point = 151°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: Fluorene is used in resins, dyes, and is a chemical intermediate.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine,

bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Compound can react exothermically with bases and with diazo compounds. Substitution at the benzene nucleus occurs by halogenation (acid catalyst), nitration, sulfonation, and the Friedel−Crafts reaction[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

PAC Ver. 29[138]

PAC-1: 6.6 milligram per cubic meter

PAC-2: 72 milligram per cubic meter

PAC-3: 430 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method #5506 PAHs by HPLC; NIOSH Analytical Method #5515, Polycyclic aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/l, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/l respectively. State Drinking Water Guidelines: Florida 500 μg/L Minnesota 300 μg/L Wisconsin 400 μg/L.

Routes of Entry: Inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Fluorene can irritate and burn the eyes and skin.

Long-Term Exposure: Handle with caution as several related polynuclear aromatic hydrocarbons (PAHs) are known carcinogens. NIOSH has recommended that coal tar pitch volatiles, including PAHs be treated as potential human carcinogen.

Medical Surveillance: This chemical is a suspected human carcinogen[77]. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: As a NIOSH potential carcinogen, store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam, or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Persons in charge of vessels or facilities are required to notify the National Response Center (NRC) immediately when there is a release of this designated hazardous substance, in an amount equal to or greater than its RQ listed above. The toll free number of the NRC is (800) 424-8802; In the Washington D.C. metropolitan area call (202) 426-2675. The rule for determining when notification is required is stated in 40 CFR 302.4 (Section IV. D.3.b).

Regulatory Authority and Advisory Information

Hazard Alert: Oxidizing gas, Corrosive (skin, eyes)

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as fluoride compounds Note: Several specific fluoride compounds are regulated by United States Environmental Protection Agency, OSHA and International regulatory bodies.

WGK[100] (German Aquatic Hazard Class): No value found for the general category of "fluorides".

Description: Of the general formula F_yM_x or M_xF_y, appearance, odor and properties vary with specific compounds. Molecular weight = 19.

Potential Exposure: Fluorides are used as an electrolyte in aluminum manufacture; a flux in smelting nickel, copper, gold, and silver; as a catalyst for organic reactions, a wood preservative; fluoridation agent for drinking water; a bleaching agent for cane seats; in pesticides, rodenticides, and as a fermentation inhibitor. They are utilized in the manufacture of steel, iron, glass, ceramics, pottery, enamels, in the coagulation of latex; in coatings for welding rods; and in cleaning graphite, metals, windows, and glassware. Exposure to fluorides may also occur during preparation of fertilizer from phosphate rock by addition of sulfuric acid. Air pollution by fluoride dusts and gases has done substantial damage to vegetation and to animals in the vicinity of industrial fluoride sources. However, the contribution of ambient air to human fluoride intake is only a few hundredths of a milligram per day, an amount that is insignificant in comparison with other sources of fluoride. Operations that introduce fluoride dusts and gases into the atmosphere include: Grinding, drying, and calcining of fluoride-containing minerals; acidulation of the minerals; smelting; electrochemical reduction of metals with fluoride fluxes or melts, as in the aluminum and steel industry; kiln firing of brick and other clay products and the combustion of coal.

Incompatibilities: Fluorides form explosive gases on contact with strong acids or acid fumes.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg [F]/m^3, 15 minutes Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg [F]/g creatinine in urine at the beginning of the next shift

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 milligram per cubic meter), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg[F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Several states have set guidelines or standards for fluorides in ambient air[60] ranging from 2.85 μ/m^3 (Iowa) to 25.0 μ/m^3 (North Dakota) to 34.0 μ/m^3 (Massachusetts) to 40.0 μ/m^3 (Virginia).

Determination in Air: Gaseous fluorides collected by impinger using caustic; particulates by filter. Analysis is by ion-specific electrode per NIOSH Analytical Method 7902[18].

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg[F]/L, as Fluoride. Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg [Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Harmful Effects and Symptoms

Short-Term Exposure: Fluorides can affect you when breathed in. Fluorides can irritate and may damage the eyes. Skin contact can cause irritation, rash or burning sensation. High repeated exposure can cause nausea, vomiting; loss of appetite; and bone and teeth changes. Extremely high levels could be fatal. Breathing can irritate the nose and throat, and cause nausea, headaches, and nosebleeds. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Very high exposure can cause fluoride poisoning with stomach pain; weakness, convulsions, collapse and death. These effects do not occur at the level of fluorides used in water for preventing cavities in teeth.

Long-Term Exposure: Bone disease (pain and tenderness of the bones); children may get mottled teeth. Repeated high exposures may affect kidneys. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite; diarrhea or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Eyes, respiratory system; central nervous system; skeleton, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with large amounts of soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: In areas with excessive gas or dust levels for any type of fluorine, worker protection should be provided. Respiratory protection by dust masks or gas masks with an appropriate canister or supplied air respirator should be provided. Goggles or full-face masks should be used. In areas where there is a likelihood of splash or spill, acid resistant clothing including gloves, gauntlets, aprons, boots, goggles, or face shield should be provided to the worker. Personal hygiene should be encouraged, with showering following each shift and before changing to street clothes. Work clothes should be changed following each shift, especially in dusty areas. Attention should be given promptly to any burns from fluorine compounds due to absorption of the fluorine at the burn site, and the possibility of developing systemic symptoms from absorption from burn sites.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10)*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)$^{*+}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not* *present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Storage color will depend on compound. Prior to working with fluorides all handlers should be trained on its proper handling and storage. Fluorides must be stored to avoid contact with strong acids (i.e., hydrochloric, sulfuric, and nitric) since violent reactions can occur. Fluorides form explosive gases on contact with nitric acid. Store in tightly closed containers in a cool, well-ventilated area away from water.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Solid material: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Do not use water.* Thermal decomposition products may include hydrogen fluoride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Reaction of aqueous waste with an excess of lime, followed by lagooning; and either recovery or land disposal of the separated calcium fluoride.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Fluorine is a yellow compressed, gas. Commonly shipped as a cryogenic gas. It has a characteristic pungent odor; the odor threshold is 0.035 ppm[41]. Molecular weight = 38.0; specific gravity (H_2O:1) = 1.6 @ 20°C; boiling point = −188.1°C; freezing/melting point = −219.4°C; Relative vapor density (air = 1): 1.31; vapor pressure = 750 mmHg @ −188.3°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 4 ₩. Violent reaction with water; forms hydrofluoric acid and oxygen. Explosive.

Potential Exposure: Elemental fluorine is used in the conversion of uranium tetrafluoride to uranium hexafluoride; in the synthesis of organic and inorganic fluorine compounds; and as an oxidizer in rocket fuel.

Incompatibilities: Fluorine is an extremely powerful oxidizing gas. Keep away from heat, water, nitric acid, oxidizers, organic compounds. Containers may explode if heated. Reacts violently with reducing agents; ammonia, all combustible materials, metals (except the metal containers in which it is shipped). Reacts violently with H_2O to form hydrofluoric acid, oxygen and ozone. The most potent oxidizer.

Permissible Exposure Limits in Air

NIOSH IDLH = 25 ppm

Odor threshold = 0.035 ppm[41].

Conversion factor: 1 ppm = 1.55 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.1 ppm/0.2 milligram per cubic meter TWA

NIOSH REL: 0.1 ppm/0.2 milligram per cubic meter TWA

ACGIH TLV[1]: 1 ppm/1.6 milligram per cubic meter TWA; 2 ppm/3.1 milligram per cubic meter

PAC* Ver. 29[138]

PAC-1: $\mathbf{1.7}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{5}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{13}_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: No numerical value established. Data may be available.

Arab Republic of Egypt: TWA 0.1 ppm (0.2 milligram per cubic meter), 1993; Australia: TWA 1 ppm (2 milligram per cubic meter); STEL 2 ppm, 1993; Austria: MAK 0.1 ppm (0.2 milligram per cubic meter), 1999; Belgium: TWA 1 ppm (1.6 milligram per cubic meter); STEL 2 ppm, 1993; Denmark: TWA 0.1 ppm (0.2 milligram per cubic meter), 1999; Finland: STEL 0.1 ppm (0.26 milligram per cubic meter), 1999; France: VLE 1 ppm (2 milligram per cubic meter), 1999; Hungary: TWA 0.2 milligram per cubic meter; STEL 0.4 milligram per cubic meter, 1993; Norway: TWA 0.1 ppm (0.2 milligram per cubic meter), 1999; the Philippines: TWA 0.1 ppm (0.2 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.05 milligram per cubic meter, MAC (STEL) 0.4 milligram per cubic meter, 1999; Sweden: NGV 0.1 ppm (0.2 milligram per cubic meter), KTV 0.3 ppm (0.5 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (0.15 milligram per cubic meter), KZG-W 0.2 ppm (0.3 milligram per cubic meter), 1999; Thailand: TWA 0.1 ppm (0.2 milligram per cubic meter), 1993; Turkey: TWA 0.1 ppm (0.2 milligram per cubic meter), 1993; United Kingdom: STEL 1 ppm (1.6 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 2 ppm. Several states have set guidelines or standards for fluorine in ambient air[60] ranging from 0 (North Carolina) to 4.0 μ/m^3 (Connecticut) to 6.7 μ/m^3 (New York) to 20.0 μ/m^3 (Florida) to 30.0 μ/m^3 (Virginia) to 20.0−40.0 μ/m^3 (North Dakota) to 48.0 μ/m^3 (Nevada).

Determination in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Small amounts of gas in air can have a strong caustic effect on the cornea, eyelids, nose.* *Inhalation:* Corrosive. Inhalation of fluorine causes coughing, choking, and chills. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. A symptomatic period of 1−2 days followed by fever, cough, tightness in chest; and cyanosis indicate pulmonary edema. Inhalation of extremely high levels may cause suffocation. It is also reported that volunteers exposed to levels of

10 ppm for up to 15 minutes reported no irritation. Levels of 25−75 ppm caused increasing irritation. Exposure to levels of 100 ppm for 1 minute caused strong respiratory irritation. *Skin:* Corrosive to the skin. It is also reported that exposure to levels between 90 and 240 ppm produced slight irritation of the skin and a "sticky" feeling of face. Contact with liquid fluorine may cause chemical burns and frostbite. *Eyes:* Corrosive to the eyes; can lead to permanent eye damage. Contact with the liquid may cause frostbite. It is also reported that mild irritation was reported at exposure to levels of 25 ppm for 5 minutes. Levels of 100 ppm for 1 minute produced marked irritation. *Ingestion:* No reported exposures by this route. LD_{50} (rat, inhalation) = < 200 ppm.

Long-Term Exposure: Prolonged exposure can cause fluorine to concentrate in the bones, causing osteosclerosis which may be disabling. The teeth can become mottled. Repeated exposure can cause nosebleeds, nausea, vomiting, loss of appetite; diarrhea and kidney damage. These effects do not occur when fluorine is used to treat drinking water to prevent cavities. It is also reported that levels of 0.1 ppm intermittently, over a prolonged period produced no ill effects.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential. Liver and kidney function tests. DEXA bone density scan (dual energy X-ray absorptiometry).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Prevent skin contact (liquid). **8 hours:** Barricade coated suits; Responder suits. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact resistant goggles when working with fumes, gases, or vapors. When working with liquids, wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Eyewash fountains should be provided (when chemical is in liquid form) in areas where there is any possibility that workers could be exposed to the substance; this is irrespective of the recommendation involving the wearing of eye protection. Facilities for quickly drenching the body should be provided (when chemical is in liquid form) within the immediate work area for emergency use where there is a possibility of exposure. [Note: It is intended that these facilities provide a sufficient quantity or flow of water to quickly remove the substance from anybody areas likely to be exposed. The actual determination of what constitutes an adequate quick drench facility depends on the specific circumstances. In certain instances, a deluge shower should be readily available, whereas in others, the availability of water from a sink or hose could be considered adequate][77]

Respirator Selection: *Up to 1 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); *Up to 5 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; *Up to 250 ppm:* SaF:Pd,Pp (APF = 2000) Any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:*

GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Danger: Do NOT use a gas mask with activated carbon filters containing activated carbon filters in atmospheres of high concentrations of fluorine gas. The activated carbon may spontaneously ignite.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/ Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Fluorine must be stored to avoid contact with most oxidizable materials because it frequently causes them to start on fire. It will frequently ignite bromine, iodine, sulfur; alkaline metals (such as sodium and potassium) and a number of organic chemicals (such as benzene and ethyl alcohol). It should not contact nitric acid, because an explosive gas will be produced. Contact with hydrogen or amorphous silicon dioxide will cause an explosion. Store in containers, such as cylinders, in a cool, well-ventilated area away from heat, water and steam. Heat can cause cylinders to burst. Contact with water or steam can produce heat and corrosive and poisonous gases. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1045 Fluorine, compressed, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 5.1-Oxidizer, 8-Corrosive material, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Fluorine and fluorine, compressed

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 1.4/2.3

Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If liquid fluorine is spilled, clear the area and allow it to evaporate. Vapors are heavier than air and will collect in low areas. *Do not use water* or wet method. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable, but reacts chemically with any material capable of burning. A few whiffs of the gas or vapor could cause death. Gas, vapor or liquid could be fatal on penetrating the firefighters' normal full protective clothing. Only special protective clothing designed to protect against fluorine should be used; the normal full protective clothing available to the average fire department will not provide adequate protection. Do not direct water onto fluorine leaks as the fire may be intensified. *For small fire*, use dry chemical or carbon dioxide. *For large fire*, use water spray, fog, or foam. *For massive fire in cargo area*, use unmanned hose holder or monitor nozzles[88,136]. This gas is under pressure; containers may rupture and explode when heated. Fluorine can ignite combustible materials and can increase the severity and intensity of an ongoing fire. Use extinguisher appropriate to the burning material. Do not spray water directly on leaking fluorine as poisonous gases are produced. Keep sealed fire-exposed cylinder cool by spraying with water. For small fire, used dry chemical or carbon dioxide. For large fire, use water spray, fog, or foam. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. A few whiffs of the gas or vapor could cause death. Gas, vapor of liquid could be fatal on penetrating the firefighters' normal full protective clothing.

Only special protective clothing designed to protect against fluorine should be used; the normal full protective clothing available to the average fire department will not provide adequate protection. Do not direct water onto fluorine leaks as the fire may be intensified. Do *NOT* spray water on leaking cylinder (to prevent corrosion of cylinder). Turn leaking cylinder with the leak up to prevent escape of gas in liquid state.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Fluorine may be combusted by means of a fluorine-hydrocarbon air burner followed by a caustic scrubber and stack. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Exposure can be lethal, Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Alert: Combustible.

Banned or Severely Restricted (in agriculture) (several countries) (UN)[13]

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P057

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)]

Hazard symbols, risk, & safety statements: Hazard symbol: T+; Risk phrases R24; R28; R62; R63; safety phrases: S1/2; S36/37; S41; S45 (see Appendix 4).

Description: Fluoroacetamide is a colorless, crystalline solid. Molecular weight = 77.07; freezing/melting point = 107−109°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: This material is an organofluorine rodenticide; insecticide proposed mainly for use on fruits to combat scale insects, aphids, and mites. Use is largely restricted to licensed pest control operators.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No OSHA, NIOSH, or ACGIH standards set for organic fluorides.

PAC Ver. 29[138]

PAC-1: 0.53 milligram per cubic meter

PAC-2: 5.8 milligram per cubic meter

PAC-3: 19 milligram per cubic meter

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Signs and symptoms may be extremely severe and range from nausea, vomiting, and diarrhea to convulsions, coma, and heart failure. Other symptoms include hyperactivity, respiratory depression or arrest; cyanosis (blue tint to the skin and mucous membranes); and ventricular fibrillation. This material is super toxic; probable oral lethal dose in humans is less than 5 mg/kg, or a taste (less than 7 drops) for a 150-lb person. Chemically inhibits oxygen metabolism by cells with critical damage occurring to the heart, brain, and lungs, resulting in heart failure; respiratory arrest; convulsions, and death. *Warning:* Effects usually appear within 30 minutes of exposure but may be delayed as long as 20 hours. Caution is advised. Vital signs should be monitored closely.

Points of Attack: Heart, brain, and kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the fluoride TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests.

First Aid: Acute exposure to fluoroacetamide may require decontamination and life support for the victim. *Inhalation:* Move victim to fresh air. Call 911 or emergency medical service. Evaluate vital signs. If no pulse is detected, provide CPR. If possible, rush victim to a healthcare facility. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. *Eye Exposure:* Remove any contact lenses at once and flush eyes with lukewarm water for 15 minutes. *Skin Exposure:* Follow steps under inhalation above. Wash exposed skin areas three times with soap and water. Rush to healthcare facility. *Ingestion:* Evaluate vital signs, including pulse and respiratory rate, and note any trauma. If no pulse is detected, provide CPR. Obtain authorization and/or further instructions from the local hospital for performance of other invasive procedures. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Emergency personnel should wear protective clothing appropriate to the type and degree of contamination. Air-purifying or supplied-air respiratory equipment should also be worn, as necessary. Rescue vehicles should carry supplies, such as plastic sheeting and disposable plastic bags to assist in preventing spread of contamination. For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator). *25 milligram per cubic meter:* 95XQ (APF = 10) *[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa:Cf (APF = 25)*+ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include fluorine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Odor threshold = 0.03 milligram per cubic meter.

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg [F]/m^3 [15-minute] Ceiling Concentration

ACGIH TLV[1]: 5 ppm/0.41 mg[F]/m^3 TWA; 2 ppm/1.64 mg[F]/m^3 Ceiling Concentration; [skin]; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

PAC Ver. 29[138]

PAC-1: 0.043 milligram per cubic meter

PAC-2: 0.47 milligram per cubic meter

PAC-3: 0.93 milligram per cubic meter

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. The major symptoms of fluoroacetic acid poisoning include severe epileptiform convulsions alternating with coma and depression; death may result from asphyxiation during convulsion or from respiratory failure.

Cardiac irregularities, such as ventricular fibrillation and sudden cardiac arrest; nausea, vomiting, excessive salivation; numbness, tingling sensations; epigastric pain; mental apprehension; muscular twitching; low blood pressure; and blurred vision may also occur. This material is very toxic; LD_{50} (oral-rat) = 4.7 mg/kg (extremely toxic), and may affect the cardiovascular system; central nervous system; and kidneys, and may cause cardiac and renal failure. This may cause death.

Long-Term Exposure: See information for "Short-Term Exposure."

Points of Attack: Central nervous system; heart, kidneys, lungs.

Medical Surveillance: Kidney function tests. EKG. Lung function tests. Examination of the nervous system. Consider chest X-ray following acute exposure.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Eyes: Remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. Skin: Remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. *Inhaled*: Remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. *Swallowed:* Get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of central nervous system; cardiac, and renal failure do not become manifest until a few hours have passed. Specific treatment is necessary in case of poisoning with this substance; the appropriate means with instructions must be available.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: UN2642 Fluoroacetic acid, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material. Stop leak if you can do so without risk. Stay upwind; keep out of low areas. Use water spray to reduce vapors. For *small spills*, take up with sand or other noncombustible absorbent material and place into containers for later disposal. For *large spills*, dike spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride and oxides of carbon. *Small fires:* use dry chemical, carbon dioxide; water spray; or foam. *Large fires:* Use water spray, fog, or foam. Stay upwind; keep out of low areas. Wear self-contained, positive pressure breathing apparatus and full protective clothing. Move container from fire area. Cool containers that are exposed to flames with water from the side until well after fire is out. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[24].

Regulatory Authority and Advisory Information

Carcinogenicity: At the time of this review, no studies were found on the possible carcinogenic activity of fluoroacetyl chloride in humans, experimental animals; or in the *Salmonella* mutagenicity test.[NLM]

Hazard Alert: Exposure can be lethal, Combustible, Water and air reactive.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg).

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg[F]/L, as Fluorides.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C; risk phrases: R14; R22; R26; R34; R35; R36/37/38; R50/53; safety phrases: S3/7; S9; S26; S27; S36/37/39; S38; S45; S53; S41 (see Appendix 4)

Description: Fluoroacetyl chloride is a liquid. Molecular weight = 96.49; boiling point = 73°C; vapor pressure = 80 *mm*Hg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 2. ₩Reacts with water forming corrosive hydrochloric acid.

Potential Exposure: May be used in organic synthesis.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Chlorides or fluorides may ignite combustibles (i.e., wood, paper, oil, etc.) or react violently with water forming hydrochloric acid.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.91 milligram per cubic meter

PAC-2: 10 milligram per cubic meter

PAC-3: 60 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, dermal contact possible.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic by inhalation. Irritating and corrosive to skin, eyes and respiratory tract. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Clinical effects are usually seen within 1/2 hour of exposure. Symptoms of nausea, vomiting, excessive salivation, abdominal pain, numbness, a tingling sensation, and apprehension are seen initially, and may last for up to 6 hours. Muscular twitching, blurred vision, and hypotension may develop. Severe effects such as coma, convulsions, and cardiac arrhythmias may be delayed in onset as long as 20 hours[88].

Long-Term Exposure: May cause respiratory problems. Lung damage.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2922 Corrosive liquids, toxic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials.

Spill Handling: UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors (may react violently with water). *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluorine, hydrogen chloride and oxides of carbon. This material is a combustible solid and highly water reactive; forms corrosive hydrochloric acid. Extinguish with dry chemical, carbon dioxide. Spray cooling water on unopened containers that are exposed to flames until well after fire is out. Move container from fire area if you can do so without risk. Do not get water in container, as material may react violently with water. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Fluorobenzene F:0350

Formula: C_6H_5F

Synonyms: Benzene fluoride; Benzene, fluoro-; MFB; Monofluorobenzene; Phenyl fluoride

CAS Registry Number: 462-06-6
RTECS Number: DA0800000
UN/NA & ERG Number: UN2387/130
EC Number: 207-321-7

Regulatory Authority and Advisory Information

Hazard Alert: Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Harmful to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xi, T, N; risk phrases: R12; R25; R36/37/38; R39; 23/24/25; R51/53; safety phrases: S7/9; S16; S26; S29; S33; S36/37; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Fluorobenzene is a colorless liquid. Molecular weight = 96.11; boiling point = 85°C; flash point = −15°C. Explosive limits: LEL: 1.3%; UEL: 9%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 0. Insoluble in water.

Potential Exposure: Fluorobenzene is used as an insecticide and as a reagent for plastic or resin polymers.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 1200 milligram per cubic meter

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 2.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms. Hazardous to the aquatic environment. May be hazardous to the aquatic environment. Do not allow release to the environment unless proper permits are obtained from the federal government.

Routes of Entry: Inhalation, passing through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Fluorobenzene can irritate the eyes, nose, throat and lungs. Eye irritation may be serious. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. A closely related chemical, chlorobenzene, can damage the liver and kidneys with high or repeated exposure. It is unknown if fluorobenzene causes these effects. Overexposure could cause headache, nausea and make you dizzy.

Long-Term Exposure: May cause liver and kidney damage. Repeated exposure may damage the lungs and affect the nervous system.

Points of Attack: Lungs, liver, kidney, nervous system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: periodic lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: tests for kidney and liver function. Examination of the nervous system. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Where there is potential for exposures to fluorobenzene exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Fluorobenzene must be stored to avoid contact with oxidizers, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where fluorobenzene is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of fluorobenzene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of fluorobenzene.

Shipping: UN2387 Fluorobenzene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. Thermal decomposition products may include toxic hydrogen fluoride and oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Fluorotrichloromethane is a colorless liquid or gas. Chlorinated solvent odor. The Odor Threshold is 5.0 *ppm*. Molecular weight = 137.37; specific gravity (H_2O:1) = 1.47 (Liquid @ 23.9°C); boiling point = 24°C; freezing/melting point = −110°C; Relative vapor density (air = 1) = 4.74; vapor pressure = 750 mmHg @ 23.3°C.

Explosive limits: LEL = 25,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 1. Soluble in water; solubility = 0.1% @ 23.9°C.

Potential Exposure: This material is used as a refrigerant; aerosol propellant; and foaming agent; as blowing agent in production of polyurethane foams.

Incompatibilities: Chemically active and powdered metals: aluminum, barium, sodium, potassium, calcium, powdered aluminum; zinc, magnesium.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.62 milligram per cubic meter @ 25°C & 1atm

OSHA PEL: 1000 ppm/5600 milligram per cubic meter TWA

NIOSH REL: 1000 ppm/5600 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 1000 ppm/5620 milligram per cubic meter Ceiling Concentration, Not Classifiable as a Human carcinogen*, as trichloromonofluoromethane*

NIOSH IDLH = 2000 ppm

PAC Ver. 29[138]

PAC-1: 91 ppm

PAC-2: 1000 ppm

PAC-3: 10.000 ppm [= > 10% LEL, lower explosive limit but <50% LEL]

DFG MAK: 1000 ppm/5700 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C, *as trichloromonofluoromethane*

Australia: TWA 1000 ppm (5600 milligram per cubic meter), 1993; Austria: MAK 1000 ppm (5600 milligram per cubic meter), 1999; Belgium: STEL 1000 ppm (5620 milligram per cubic meter), 1993; Denmark: TWA 500 ppm (2810 milligram per cubic meter), 1999; Finland: TWA 1000 ppm (5600 milligram per cubic meter; STEL 1250 ppm (7000 milligram per cubic meter), 1993; Hungary: STEL 40 milligram per cubic meter, 1993; Japan: 1000 ppm (5600 milligram per cubic meter), 1999; Norway: TWA 500 ppm (2800 milligram per cubic meter), 1999; the Philippines: TWA 1000 ppm (5600 milligram per cubic meter), 1993; Poland: MAC (TWA) 500 milligram per cubic meter, MAC 5600 milligram per cubic meter, 1999; Russia: STEL 1000 ppm (1000 milligram per cubic meter), 1993; Sweden: NGV 500 ppm (3000 milligram per cubic meter), KTV 750 ppm (4500 milligram per cubic meter), 1999; Switzerland: MAK-W 1000 ppm (5600 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (5600 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (5710 milligram per cubic meter); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 1000 ppm. Russia set a MAC in ambient air in residential areas of 100 milligram per cubic meter on a once-daily basis and 10 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for F-11 in ambient air[60] ranging from 13.0 milligram per cubic meter (Virginia) to 56.0 milligram per cubic meter (North Dakota) to 112.0 milligram per cubic meter (Connecticut) to 133.33 milligram per cubic meter (Nevada) to 560 milligram per cubic meter (North Carolina). Beyond this, general concern about destruction of the ozone layer above the earth has prompted restrictions on chlorofluorocarbon use and venting to the atmosphere. Substitute materials are being developed to reduce emissions drastically.

Determination in Air: Charcoal adsorption, workup with CS2, analysis by gas chromatography/flame ionization. See NIOSH Analytical Method (IV) #1006[18].

Permissible Concentration in Water: For the protection of human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a level of 1.9 μg/L. In January 1981 EPA (46FR2266) removed F-11 from the priority toxic pollutant list. Several states have developed guidelines for F-11 in drinking water[61] ranging from 1.0 μg/L (Arizona) to 2300 μg/L (Maine) to 3400 μg/L (California) to 3500 μg/L (Wisconsin) to 8000 μg/L (Kansas) to 8750 μg/L (Maryland).

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{ow} = 2.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the skin and eyes. Overexposure can cause lightheadedness, dizziness, incoherence, tremors, cardiac arrythmia; asphyxiation; cardiac arrest. This can occur without other warning symptoms. The liquid may cause frostbite.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dryness and cracking. Can irritate the lungs, causing coughing and/or shortness of breath.

Points of Attack: Skin, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: urine (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider Holter monitor (a special 24 hour EKG to look for irregular heart beat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large

quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Trichlorofluoromethane must be stored to avoid contact with chemically active metals, such as aluminum or lithium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat.

Shipping: Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Thermal decomposition products may include hydrogen fluoride, hydrogen chloride and phosgene. Use extinguishing agents suitable for surrounding fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Fluorouracil is a white crystalline solid. Practically odorless. Molecular weight = 130.08; boiling point = 361°C; freezing/melting point = 282−283°C (decomposes); vapor pressure = 1×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Soluble in water.

Potential Exposure: This material is used as an antineoplastic drug for cancer treatment and as a chemosterilant for insects.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, methotrexrate sodium, sources of heat.

Permissible Exposure Limits in Air

PACVer. 29[138]

PAC-1: 1.7 milligram per cubic meter

PAC-2: 19 milligram per cubic meter

PAC-3: 46 milligram per cubic meter

Determination in Water: Octanol−water coefficient: $\log K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate and burn the eyes and skin. Can cause headache, fatigue, dizziness, and mental confusion; nausea, vomiting, diarrhea, and abdominal pain. Minimum toxic dose in humans is approximately 450 mg/kg (total dose) over 30 days for the ingested drug. Intravenous minimum toxic dose in humans is a total dose of 6 mg/kg over 3 days. Depression of white blood cells occurred after intravenous administration of a total dose of 480 mg/kg over 32 days. Occasional neuropathy and cardiac toxicity have been reported. Do not use during pregnancy. Patients with impaired hepatic or renal function, with a history of high-dose pelvic irradiation or previous use of alkylating agents should be treated with extreme caution. Patients with nutritional deficiencies and protein depletion have a reduced tolerance to fluorouracil.

Long-Term Exposure: May decrease fertility in males and females. May cause skin allergy. Very high exposure may affect the heart. Loss of appetite and nausea are earliest symptoms, with other symptoms of diarrhea, inflammation or sores in the mouth; gastric burning; and intestinal discomfort. More serious symptoms are due to the suppression of bone marrow, with decrease of white cell count and blood platelets, and anemia. Hair loss, nail changes; dermatitis, pigmentation and atrophy of skin also occur. Sunlight can exacerbate these effects.

Points of Attack: Blood, heart, skin.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH, may be indicated.

CBC, EKG, evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool place, possibly a refrigerator. Store @ 59−86°F/15−30°C. Keep away from oxidizers, strong bases; and heat.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. If water pollution occurs, notify appropriate authorities. Spill or leak; shut off ignition sources; no flares, smoking or flames in hazard area. Keep combustibles (wood, paper, oil etc.) away from spilled material. Do not touch spilled material. *Small spills*: Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol; or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

HSDB Number: 2018

RTECS Number: VV8225000

UN/NA & ERG Number: UN1778/154

EC Number: 241-034-8 [*Annex I Index No.:* 009-011-00-5]

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2 mg[F]/L, as fluorides.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R34; safety phrases: S1/2; S26; S27; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Fluorosilicic acid is a transparent, colorless fuming liquid. Molecular weight = 144.09; specific gravity (H_2O:1) = 1.04 @ 17.5°C; boiling point = about 100°C (decomposes); freezing/melting point ≤ -20°C. It is not flammable. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: A solution of fluorosilicic acid is used for sterilization in the brewing and bottling industry, electrolytic refining of lead; electroplating, hardening cement; removing mold, and others.

Incompatibilities: The aqueous solution is a strong acid. Reacts with water or steam to produce toxic and corrosive fumes of hydrogen fluoride. Incompatible, and may react violently with: bases, aliphatic amines; alkanolamines, alkylene oxides; aromatic amines; amides, ammonia, ammonium hydroxide; calcium oxide; epichlorohydrin, isocyanates, oleum, organic anhydrides; sulfuric acid; strong oxidizers; vinyl acetate; water. Attacks glass, concrete, and ceramics. The anhydrous form dissociates almost instantly into silicon tetrafluoride and hydrogen fluoride.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg [F]/m^3, 15 min. Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

PAC Ver. 29[138]

PAC-1: 9.5 milligram per cubic meter

PAC-2: 110 milligram per cubic meter

PAC-3: 630 milligram per cubic meter

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Russia[43] has set MAC values for ambient air in residential areas as 0.03 milligram per cubic meter on a momentary basis and 0.01 milligram per cubic meter on a daily average basis[43].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Medical observation is recommended. *Inhalation:* May cause difficult breathing and burning of the mouth, throat and nose, which may result in bleeding. These may be felt @ 7.5 milligram per cubic meter. Nausea, vomiting, profuse sweating and excess thirst may occur at higher levels. *Ingestion:* Corrosive. Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. 5−40 mg may cause nausea, diarrhea, and vomiting. More severe symptoms of burning and painful abdomen; sores in mouth; throat and digestive tract; tremors, convulsions and shock will occur around a dose of 1 gram. Death may result in ingestion of 2−5 g.

Long-Term Exposure: Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 milligram per cubic meter or higher. May cause mottling of the bones or teeth at this level, resulting in fluorosis. May cause lung damage.

Points of Attack: Bones, lungs.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential. DEXA bone densitometry scan.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. *Note to Physician:* Inject intravenously 10 mL of 10% calcium gluconate solution. Gastric lavage with lime water of 1% calcium chloride.

Personal Protective Methods: Use only with an effective and properly maintained exhaust ventilation or with a fully enclosed process. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Remove any clothing that you think may have become chemically soiled and wash before reuse. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 milligram per cubic meter:* Q_m (APF = 25) (any quarter-mask respirator).

25 milligram per cubic meter: 95XQ (APF = 10) *[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 milligram per cubic meter:* Sa: Cf (APF = 25) $^{*+}$ (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 milligram per cubic meter:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *250 milligram per cubic meter:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)$^{+}$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry area that is well-ventilated. Protect from damage. Avoid acids. Concentrated solution can be stored in glass, but lead is preferred.

Shipping: UN1778 Fluorosilicic acid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Enter only with protective clothing and devices. Treat with soda ash or slaked lime. Dilute with water. Use an industrial vacuum cleaner to remove the spill. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Material itself is not flammable. *Do not use water*. Use CO_2 or dry chemicals on surrounding fire. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers.

If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire-fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to a large amount of soda ash in solution[22]. Discharge to sewer with large volumes of water.

Flurazepam F:0390

Formula: $C_{21}H_{23}ClFN_3O$

Synonyms: 7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1*H*-1,4-benzodiazepin-2(3*H*)-one; Dalmane; Felmane; Noctosom; Ro-5-6901/3; Stauroderm

CAS Registry Number: 17617-23-1

HSDB Number: 3085

RTECS Number: DF2368050; DF0875000

UN/NA & ERG Number: UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 241-591-7

Regulatory Authority and Advisory Information

United States Department of Justice controlled substance [CFR 21 Part 1308.4 (Depressants)].

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn; risk phrases: R11; R22; R23/24/25; R33; R39/23/24/25; R51/53; safety phrases: S1/2; S7; S16; S22; S26; S36/37; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Flurazepam is a pale yellow crystalline solid. Molecular weight = 387.88; freezing/melting point = 79.5°C. Solubility in water; solubility = 500 mg/L.

Potential Exposure: A Drug. Flurazepam is used as a sedative in capsules or liquid form.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Flurazepam can affect you when breathed in. Flurazepam is used as a medical depressant drug. When taken in that way, it can cause drowsiness and difficulty with coordination, concentration and balance. It can also cause irritability, anxiety, weakness, headache, upset stomach and joint pains. Effects may last for 1−3 days. It is not known for certain if these effects occur from occupational exposure. Drinking alcohol after exposure may worsen the symptoms caused by flurazepam. Person taking lithium (a medication), could have a serious reaction with flurazepam exposure.

Long-Term Exposure: Exposure to flurazepam may cause jaundice, skin rash, and a low white blood cell count. Similar compounds are known teratogens. Suddenly discontinuing exposure after high exposure for @ 3 months may cause shakiness, irritability, and convulsions.

Points of Attack: Blood, liver, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood flurazepam level. CBC. Liver function tests. Evaluation by a qualified allergist.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids.

Skin Contact: Remove contaminated clothing. Wash contaminated skin with water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. If you are required to work in a "sterile" environment you require special training.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishing agents suitable for surrounding fire. Thermal decomposition products may include chlorine and fluorine chemicals and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 261-916-6

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans.

Hazard symbols, risk, & safety statements: Hazard symbol: N, Xn; risk phrases: R21; R22; R36/37/38; R51/53; safety phrases: S16; S26; S36/37; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: White to tan crystalline solid. Some commercial formulations are a light tan viscous liquid, possibly in a propylene glycol carrier. Slight odor. Molecular weight = 329.33; specific gravity (H_2O:1) = 1.15 @ 25°C; boiling point = 100°C; freezing/melting point = 154°C; vapor pressure = 1×10^{-7} mmHg @ 20°C; Flash point (liquid) = > 93.3°C; Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Low solubility in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Organic fluoride herbicide used is horticulture, ornamental, aquatic and greenhouse environments. It is used as and auatic herbicide to treat large areas of water (lakes, ponds, reservoirs, etc.) for invasive Eurasian watermilfoil. Not used on food crops.

Incompatibilities: Decomposes in temperature >200°C. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Concentration in Water: Federal Drinking Water Standards (minimum reporting level) : EPA 0.90 μg/L[83]. State Drinking Water Guidelines: Florida 560 μg/L. *Fluoride ion*: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol–water coefficient: $\text{Log } K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—678.82839 ppb, MATC.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air purifying respirators for pesticides. May be harmful if swallowed. LD_{50} (oral, rat) ≥ 5000 mg/kg; >10,000 mg/kg. Low toxicity.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. Human toxicity (long term)[101]: Very low—560.00 ppb, Health Advisory.

Points of Attack: Bones.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as end ocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as Butyl rubber (0.4–0.7 mm thickness/ >480 minutes; DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d) (4–6), the handler PPE requirements may be reduced or modified as specified in the

WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Store in a refrigerator and protect from exposure to oxidizers or moisture[52]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Decomposes >200°C. Thermal decomposition products may include hydrogen fluoride, carbon, and sulfur oxides. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Safe Disposal of Pesticides. An empty pesticide container can be as hazardous as a full one because of residues left inside. Never reuse such a container. When empty, a pesticide container should be rinsed carefully three times and rinse the water thoroughly drained back onto the sprayer or the container previously used to mix the pesticide. Use the rinse water as a pesticide, following label directions. Replace the cap or closure securely. Dispose of the container according to label instructions. Do not puncture or burn a pressurized container like an aerosol—it could explode. Do cut or puncture other empty pesticide containers made of metal or plastic to prevent someone from reusing them. Wrap the empty container and put it in the trash after you have rinsed it[83]. Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Fluroxypyr F:0395

Formula: $C_7H_5Cl_2FN_2O_3$

Synonyms: Acetic acid [(4-amino-3,5-dichloro-6-fluoro-2-pyridinyl)oxy]-,1-methylheptyl ester; [(4-Amino-3,5-dichloro-6-fluoro-2-pyridinyl)oxy]acetic acid, 1-methylheptyl ester; 1-Methylheptyl [(4-amino-3,5-dichloro-6-fluoro-2-pyridinyl)oxy]acetate.

Methyl ester: Agrostar; Bofix FFC; Cabadex; Cascade; Dowco 433 mhe; Forefront; Galaxy gl184; Paradigm;

Pasturegard; Starane; Tomahawk; Vista; Widematch (fluroxypyr + clopyralid); XRM-5084

CAS Number: 69377-81-7; 81406-37-3 (1-methyheptyl ester)

HSDB Number: 6655

RTECS Number: AF2503000

UN/NA&ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: *[Annex I Index No.:* 607-255-00-2]; 279-752-9 *[Annex I Index No.:* 607-272-00-5] (-methy ester).

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Not likely to be carcinogenic to humans.

European/International Regulations [69377-81-7; 81406-37-3 (1-methyheptyl ester)]: Hazard symbol: N; risk phrases: R52/R53; safety phrases: S2; S60; S61 (see Appendix 4)

Description: White crystalline solid. Molecular weight = 255.03; 367.23 (-methyl ester); specific gravity (H_2O:1) = 1.1 @ 25°C; boiling point = (decomposes); freezing/melting point = 232°C; vapor pressure = 4×10^{-6} mmHg @ 25°C. Highly soluble in water.

Potential Exposure: Those who manufacture, distribute or use this pyridinecarboxylic acid/pyridine herbicide.

Incompatibilities: May not be compatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition; forming a strong acid. Temperatures above 250°C can cause decomposition. *Methyl ester*: Esters react with acids to liberate heat along with alcohols and acids. Strong oxidizing acids may cause a vigorous reaction that is sufficiently exothermic to ignite the reaction products. Heat is also generated by the interaction of esters with caustic solutions. Flammable hydrogen is generated by mixing esters with alkali metals and hydrides.

Determination in Water: Octanol−water coefficient: $\text{Log } K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air purifying respirators for pesticides. May be harmful if swallowed. LD_{50} (oral, rat) = 2405−3650 mg/kg; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: Possible kidney damage.

Points of Attack: Kidney, adrenal and testicular glands

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: If a spill occurs, clean it up promptly. Don't wash it away. Instead, sprinkle the liquid spill with sawdust, vermiculite, or kitty litter. Sweep it into a plastic garbage bag, and dispose of it as directed on the pesticide product label. Wash all contaminated surfaces with a soap and water solution.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon, hydrogen chloride and chlorine gases. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small* *fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Flurprimidol F:0396

Formula: $C_{15}H_{15}F_3N_2O_2$

Synonyms: Compound-72500; Cutless 50W; EL-500; α-Isopropyl-α-[*p*-(trifluoromethoxy)phenyl]-5-pyrimidine-methanol; α-(1-Methylethyl)-α-[4-(trifluoromethoxy)phenyl]-5-pyrimidinemethanol; α-(1-Methylethyl)-α-[4-(trifluoromethoxy)phenyl]-; 5-Pyrimidinemethanol, Topflor

CAS Number: 56425-91-3

RTECS Number: UV9283500

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: Not assigned

Regulatory Authority and Advisory Information

EPA Toxicity Class III, Caution, Slightly toxic

SARA Title III Acute Health Hazard

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R20/21/22; R62; R63; R51/53; safety phrases: S24/25; S36/37/39; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to waters (est.)]

Description: White to pale yellow or buff crystalline solid. Slight aromatic odor. Molecular weight = 312.29; specific gravity (H_2O:1) = 1.35 @ 25°C; boiling point = (decomposes); freezing/melting point = 94−96°C; flash point = 185°C; Autoignition temperature = < 300°C; UEL = 0.13 oz/ft.^{3}[SePRO MSDS] Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Moderately soluble in water.

Potential Exposure: Pyrimidine plant growth regulator Used on turf and ornamental trees which reduces internode and leaf elongation in cool and warm seasons. A turf grass growth deterrent.

Incompatibilities: Decomposes in temperatures above 200°C. May react with strong oxidizers such as chlorates, peroxides, nitrates, etc.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 µg[F]/L; Federal Drinking Water Guidelines: EPA 2000 µg[F]/L; State Drinking Water Standards: California 2000 µg[F]/L; Delaware 2000 µg[Fl]/L; Pennsylvania 2000 µg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 µg[F]/L; Maine 1680 µg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air purifying respirators for pesticides. May be harmful if swallowed. LD_{50} (oral, rat) = 709−1250 mg/kg; LD_{50} (dermal, rabbit) = > 2000 mg/kg.

Long-Term Exposure: May be a liver and kidney toxicant.

Points of Attack: May affect liver, kidneys, adrenal and ovary glands

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[72]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4−6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Where the neat test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e., organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO2 and a high efficiency particulate filter)[193]

Storage: Color code—Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is partially combustible; it may burn but does not easily ignite; may support combustion at high temperatures. Use dry chemical powder extinguishers, foam, carbon dioxide. Thermal decomposition products may include oxides of nitrogen, carbon, hydrogen fluoride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. If this material cannot be disposed of according to label instructions, it may be dissolved or mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Noncombustible containers should be crushed and buried under more than 40 cm of soil[30].

Fluvalinate F:0398

Formula: $C_{26}H_{22}ClF_3N_2O_3$

Synonyms: AI3-29426; Apistan; Caswell No. 934; *N*-2-Chloro-α,α,α-(trifluoro-*p*-tolyl)-*dl*-valinealpha-cyano-phenoxy benzyl ester; *N*-(2-Chloro-4-(trifluoromethyl)phenyl-*dl*-valine-cyano(3-phenoxylphenyl)methyl ester; *N*-[2-chloro-4-(trifluoromethyl)phenyl]-*dl*-valine(±)-cyano(3-phenoxylphenyl)methyl ester; (RS)-α-(Cyano-3-phenoxybenzyl *n*-(2-chloro-α,α,α-trifluoro-*p*-tolyl)-D-valinate; (RS)-α-Cyano-3-phenoxybenzyl (R)-2-[2-chloro-4-(trifluoromethyl)anilino]-3-methylbutanoate; Cyano(3-phenoxyphenyl)methyl *N*-[((2-chloro-4-trifluoromethyl)phenyl)]-D-valinate; Kartan; Klartan; Mavrik; Mavrik aquaflow; Spur; Taufluvalinate; DL-Valine,*n*-[2-chloro-4-(trifluoromethyl)phenyl]-cyano(3-phenoxylphenyl)methyl ester; D-Valine, *N*-(2-chloro-4-(trifluoromethyl)phenyl)-, cyano(3-phenoxyphenyl)methyl ester; Yarder; Zeocon; ZR 3210

CAS Number: 69409-94-5; 102851-06-9 (*tau*-T)

HSDB Number: 6659

RTECS Number: YV9397100

UN/NA & ERG Number: UN2902 (Pesticides, liquid, toxic, n.o.s)/151; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

Regulatory Authority and Advisory Information

California Proposition 65 Chemical[102]: Developmental/Reproductive toxin (11/6/1998)

Hazard Alert: Poison, Suspected reprotoxic hazard, Possible sensitization hazard (skin), Possible endocrine disruptor, Reproductive toxin, Primary irritant (w/o allergic reaction), Environmental hazard.

Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as pyrethrum

Clean water act: Section 311 Hazardous Substances/RQ (same as CERCLA) as pyrethrins.

EPA ADI: EPA Oral reference dose (RfD) = 0.01 mg/kg

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, Xi: risk phrases: R36/37/38; R43; R50/53; R63; safety phrases: S7; S23; S26; S29/35; S35; S36; S39; S41; S45; S61(see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Yellow to yellow-amber, viscous oil. Sweet, weak odor. Molecular weight = 502.92; specific gravity (H_2O:1) = 1.30 @25°C; specific gravity (H_2O:1) = 1.29 @ 25°C; freezing/melting point = 25°C; vapor pressure = 1×10^{-7} mmHg @ 25°C. Henry's Law constant = 1.5×10^{-8} atm m^3/mol @ 25°C (est)[83]. Practically insoluble in water; solubility = 0.005 ppm @ 20−25°C.

Potential Exposure: Pyrethroid insecticide used as a broad spectrum insecticide to control moths, beetles and other pests on cereals, potatoes, fruit trees, vegetables, fleas, cotton, turf and ornamentals. It is also used to control varroa mites in honey bees. Some applications may be classified as a United States Environmental Protection Agency Restricted Use Pesticide (RUP). Formerly used as an insecticide. Production discontinued by Sandoz Agro, Inc[101].

Incompatibilities: Corrosive to some metals. Keep away from strong oxidizers and alkaline materials. Decomposes in temperatures above 350°C releasing toxic vapors of hydrogen chloride, nitrogen oxides, and hydrogen fluoride.

Permissible Exposure Limits in Air:

NIOSH[2] IDLH = 5000 ppm

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA

STEL set by HSE[33] = 10 milligram per cubic meter.

Determination in Air: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Permissible Concentration in Water: ADI = 0.02 mg/kg as pyrethroid

Determination in Water: Collection by impinger or fritted bubbler, analysis by gas liquid chromatography/ultraviolet. See NIOSH IV, Method #5008[18], pyrethrum. Octanol−water coefficient: Log $K_{ow} = > 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Extra high—0.09863 ppb, MATC.

Routes of Entry: Inhalation, absorbed through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Pyrethrins can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. High exposure can affect the nervous system causing headache, nausea, vomiting, fatigue, and restlessness, rhinorrhea (discharge of thin nasal mucous). LD_{50} (oral, rat) = < 300 mg/kg; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. High or repeated exposure can cause lung allergy (with cough, wheezing and/or shortness of breath) or hay fever symptoms (sneezing, runny or stuffy nose). Allergic "pneumonia" can also occur with cough, chest pain, breathing difficulty and abnormal chest X-ray. Repeated attacks may lead to permanent scarring. Skin allergy may also develop with rash and itching, even with lower exposures. Dermal contact can cause rash with redness, blisters and intense itching. A severe generalized allergy can occur with weakness and collapse. May be a liver and kidney toxin. Human toxicity (long term)[101]: Low—70.00 ppb, Health Advisory

Points of Attack: Respiratory system, skin, central nervous system, kidneys, liver, bones.

Medical Surveillance: Comprehensive physical examination with emphasis on the genito-urinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum FSH, and serum LH, may be carried out if, in the opinion of a physician, they are indicated. Before beginning employment and at regular times after that, the following are recommended: Employees should be screened for history of certain medical conditions which might place the employee at increased risk from pyrethroid exposure. Chronic respiratory disease: In persons with chronic respiratory disease, especially asthma, the inhalation of pyrethroids might cause exacerbation of symptoms due to its sensitizing properties. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Consider chest X-ray if lung symptoms are present. Skin disease: Pyrethroids can cause dermatitis which may be allergic in nature. Persons with preexisting skin disorders may be more susceptible to the effects of this agent. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Any employee developing the above-listed conditions should be referred for further medical examination[9].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4–6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: NIOSH/OSHA *for pyrethrum*: *50 milligram per cubic meter:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator).*125 milligram per cubic meter:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter).*250 milligram per cubic meter:* CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece).*5000 milligram per cubic meter:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location at temperature <35°C and away from alkaline materials. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2902 Pesticides, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, hydrogen fluoride gas and oxides of nitrogen and carbon. *On a small fire:* use dry chemical, CO_2 or water spray. On a large fire: use water spray, fog or regular foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Incineration would be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Fomesafen F:0399

Formula: $C_{15}H_{10}ClF_3N_2O_6S$

Synonyms: BAS 53004; Benzamide, 5-[2-chloro-4-(trifluoromethyl)phenoxy]-*N*-(methylsulfonyl)-2-nitro-; 5-[2-Chloro-4-(trifluoromethyl)phenoxy] -*N*-methylsulfonyl)-2-nitrobenzamide; 5-(2-Chloro-α,αα-trifluoro-*p*-tolyloxy)-*N*-methylsulfonyl-2-nitrobenzamide; 5-[2-Chloro-4-(trifluoromethyl) phenoxy]-*N*-(methylsulphonyl)-2-nitrobenzamide; Faster; Flex; Flexstar; Fomesafen sodium; PP 021; Reflex; Reflex 2lC herbicide (sodium salt); Tornado; Twiste; Typhoon

CAS Number: 72178-02-0; 108731-70-0 (sodium salt)

HSDB Number: 6660

RTECS Number: CV2475000

UN/NA & ERG Number: UN2588 (Pesticides, solid, toxic, n.o.s.)/151

EC Number: 276-439-9 [*Annex I Index No.:* 604-040-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Poison inhalation hazard (in fire), Agricultural chemical. Listed for Tier 1 screening as an endocrine disruptor[88].

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as chlorophenoxy pesticides

Safe Drinking Water Act (47FR 9352): Priority List (55 FR 1470)

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R22; safety phrases: S2; S41 (see Appendix 4)

Description: White crystalline solid or powder. Molecular weight = 438.76; specific gravity (H_2O:1) = 1.29 @ 20°C; freezing/melting point = 220°C; Disassociation constant = p*K*a 2.827; vapor pressure = 3.5×10^{-5} mmHg @ 25°C; Henry's Law constant = 7.53×10^{-13} atm m^3/mol @ 25°C (est)[83]. Moderately soluble in water; solubility = 60 mg/L @ 25°C.

Potential Exposure: Chlorophenoxy herbicide. After July 25, 2003, flumesafen was not permitted in many countries to be used as an active ingredient on crops except to control weeds in soybean crops, and white, kidney and snap beans. Limited use allowed in some European countries.

Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 ***mg/F/L, as Fluoride***.

Determination in Water: EPA Method D3086. GC method with ECD for the determination of organochlorine pesticides in water and wastewater. Octanol−water coefficient: Log K_{ow} = negative. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: (sodium salt) Very low—69325.01943 ppb, MATC.

Routes of Entry: Inhalation, ingestion, absorbed through the skin

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Severely irritates eyes, skin and respiratory tract, with burning sensation, pain, redness and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, cyanosis (bluish tint to skin and lips), anxiety and confusion, convulsions, risk of lung edema. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch and stupor. Severe exposure can cause death from heart failure. Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. LD_{50} (oral, rat) = 1−2 g/kg; LD_{50} (dermal, rat) = 1 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. Workers exposed to chlorophenoxy compounds over a five to ten-year period at levels above 10 milligram per cubic meter complained of weakness, rapid fatigue, headache and vertigo. Liver damage, low blood pressure and slowed heartbeat were also found. Based on animal tests, may affects human reproduction. Human toxicity (long term)[101]: (sodium salt) High—1.75 ppb, Health Advisory.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidney, bones.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. The following may be useful: Liver and renal/kidney function tests. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested*. Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[88] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where the neat (undiluted) test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with an organic vapor/acid gas cartridge (specific for organic vapors: Hydrogen chloride, acid gas and SO_2) with a dust/mist filter. Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with fomesafen all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and heat. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: For leaks or spills, use water spray to disperse vapor and to flush spills. Liquid containing this material should be absorbed in vermiculite, dry sand; earth. Do not touch spilled material; stop leak if you can do it without risk. Establish forced ventilation to keep levels below explosive limit. *Small dry spills*: collect powdered material in the most convenient and safe manner and deposit in sealed containers; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, hydrogen fluoride and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m (1/2 mile) in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as a hazardous waste in a landfill approved and licensed for the disposal of pesticides. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Fonofos F:0400

Formula: $C_{10}H_{15}OPS_2$; $C_6H_5SPS(OC_2H_5)C_2H_5$

Synonyms: *O*-Aethyl-*S*-phenyl-aethyl-dithiophosphonat (German); Capfos; Cudgel; Difonate; Double down; Dyfonate; Dyphonate; ENT 25,796; *O*-Ethyl *S*-phenyl ethyldithiophosphonate; *O*-Ethyl *S*-phenyl (RS)-ethylphosphonodithioate; *O*-Ethyl *S*-phenyl ethylphosphonodithioate; Fonophos; N-2790; Phosphonodithioic acid, ethyl-*O*-ethyl, *S*-phenyl ester

CAS Registry Number: 944-22-9

HSDB Number: 1717

RTECS Number: TA5950000

UN/NA & ERG Number: (PIH) UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 213-408-0 [*Annex I Index No.:* 015-091-00-2]

Regulatory Authority and Advisory Information

United States Environmental Protection Agency Gene-Tox Program, Negative: Histidine reversion-Ames test; Negative: In vitro UDS-human fibroblast; TRP reversion; Negative: *S. cerevisiae-homozygosis*; Inconclusive: *B. subtilis* rec assay; *E. coli polA* without S9.

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Neurotoxin (cumulative), Flammable, Suspected reprotoxic hazard, Environmental hazard.

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Unsupported

Banned or Severely Restricted (in agriculture) (Malaysia, E. Germany) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Note: Classified for restricted use for direct supervision of a certified applicator.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, N; risk phrases: R10; R27/28; R33; R50/53; safety phrases: S1/2; S28; S36/37; S41; S45; S50; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Fonofos is a pale yellow liquid with a pungent, mercaptan-like odor. Molecular weight = 246.34; boiling point = 130°C @ 0.1 mm; freezing/melting point = 30°C; vapor pressure = 0.0003 mmHg @ 20°C; flash point = 93.9°C (cc). Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 2, reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this soil insecticide which is used for control of corn rootworms, wireworms, cutworms, symphylins, and other soil pests.

Incompatibilities: Strong acids, alkalies.

Permissible Exposure Limits in Air

OSHA PEL: None. However, the vacated 1989 OSHA PEL 0.1 milligram per cubic meter TWA [skin] is currently enforced in some states. NIOSH REL: 0.1 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.01 milligram per cubic meter TWA inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI_A issued for Acetylcholinesterase inhibiting pesticides

PAC Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 1.3 milligram per cubic meter

PAC-3: 53 milligram per cubic meter

Australia: TWA 0.1 milligram per cubic meter [skin], 1993; Belgium: TWA 0.1 milligram per cubic meter [skin], 1993; Denmark: TWA 0.1 milligram per cubic meter [skin], 1999; France: VME 0.1 milligram per cubic meter [skin], 1999; Switzerland: MAK-W 0.1 milligram per cubic meter [skin], 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have developed guidelines or standards for fonofos in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota) to 2.0 μ/m^3 (Connecticut, Nevada and Virginia).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: The EPA has developed health advisories for fonofos as follows: long term health advisory is 70 μg/L and lifetime health advisory is 14 μg/L (See “References” Below).

(31); Determination in Water: Fish Tox = 3.50002000 ppb (HIGH)(100).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; headache, giddiness, vertigo, sensation of tightness in chest; blurring of vision; ocular pain; loss of muscle coordination; slurring of speech; muscle twitching; drowsiness, excessive secretion of respiratory tract mucous; and convulsions. This material is a cholinesterase inhibitor. It can cause severe symptoms and death from respiratory arrest. LD_{50} (oral-rat) = 3 mg/kg (extremely toxic). Exposure above the airborne exposure limit may result in death. The effects may be delayed. Medical observation is recommended. Human Tox (ppb): 10.00000 (INTERMEDIATE).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Fonofos may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system; central nervous system; cardiovascular system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over *0.1 milligram per cubic meter*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool area.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.3/0.4

Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200

Then: Protect persons downwind (mi/km)

Day 1.4/2.3

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide; water spray, fog, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This phosphono compound is reported to be satisfactorily decomposed by hypochlorite. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: [*Annex I Index No.:* 613-254-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity: GHS H351, Category 2, Suspected human carcinogen.

Hazard Alert: Agricultural chemical, Environmental hazard.

EPA Acute reference dose (ARfD) = 0.1 mg/kg/day

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R40; R20/21/22; R51/R53; safety phrases: S2; S29/35; S36/37; S46; S61; S41; S46; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: White to faint yellow crystalline powder. Molecular weight = 247.69; specific gravity (H_2O:1) = 1.415 @ 25°C; freezing/melting point = 170−172°C; vapor pressure = very low, 4×10^{-10} mmHg @ 25°C; flash point = > 200°C (cc); low solubility in water.

Potential Exposure: Phenylurea/substituted urea plant growth regulator widely used in agriculture on fruits to increase their size, to promote cell division, and to improve the quality and the yield of fruits, especially table grapes, grape raisins, and kiwi fruit. In some parts of California, forchlorfenuron is reputed to double the size of Thompson seedless grapes and delay crop maturity up to several weeks.

Incompatibilities: May react with strong oxidizers such as chlorates, peroxides, nitrates, etc. Dust may form explosive mixture with air.

Determination in Water: Octanol−water coefficient: Log K_{ow} = > 3.0. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, dermal contact, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation can cause irritation of the lungs and respiratory tract; May be harmful if swallowed. Dermal contact may cause severe irritation or burns. LD_{50} (oral, rat) = 4904 mg/kg[83]; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. May cause emphysema, weight loss.

Points of Attack: Respiratory system, bones.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water. Do not induce vomiting when formulations containing petroleum solvents are ingested. Do not make an unconscious person vomit.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000): (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place and protect from exposure to ultraviolet light. Keep liquid away from oxidizers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2767 Phenyl urea pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: *Dry material:* First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Dampen spilled material with 60–70% acetone and avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride and nitrogen oxides. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mile in all directions; also, consider initial evacuation for 800 m/0.5 mile in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters.

Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. If this material cannot be disposed of according to label instructions, it may be dissolved or mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F+, Xi; risk phrases: R45; R5; R12; R19; R21; R23/24/25; R34; R40; R43; R61; R62; R63; safety phrases: S1/2; S9; S26; S33; S36/37/39; S38; S45; S51; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Formaldehyde is a colorless, pungent gas or aqueous solution. The Odor Threshold is 0.8 ppm[41]. Also, formalin is an aqueous solution that is 37% formaldehyde by weight; inhibited solutions (added to prevent polymerization) usually contain 6−12% methyl alcohol. Molecular weight = 30.30; specific gravity (H_2O:1) = 0.78; (formalin) 1.08 @ 25°C; Boiling point (gas) = −19.5°C. The 37% commercial solution BP = 101°C; Freezing/Melting point = −92.2°C; Relative vapor density (air = 1) = 1.04; vapor pressure = > 1 atm; flash point = Flammable gas; (formalin) 85°C; (commercial 37% solution, 15% methanol) 50°C; Autoignition temperature = 430°C. Explosive limits (gas): LEL = 7.0%; UEL: 73.0%. NFPA 704 M Hazard identification (gas): Health 3, flammability 4, reactivity 0; (37% solution, 15% methanol): Health 3, flammability 2, reactivity 2. Good solubility in water.

Potential Exposure: Formaldehyde has found wide industrial usage as a fungicide, germicide; and in disinfectants and embalming fluids. It is also used in the manufacture of artificial silk and textiles, latex, phenol, urea, thiourea and melamine resins; dyes, and inks; cellulose esters and other organic molecules; mirrors, and explosives. It is also used in the paper, photographic, and furniture industries. It is an intermediate in drug manufacture and is a pesticide intermediate.

Incompatibilities: Pure formaldehyde may polymerize unless properly inhibited (usually with methanol). May form explosive mixture with air. Incompatible with strong acids; amines, strong oxidizers; alkaline materials; nitrogen dioxide; performic acid; phenols, urea. Reaction with hydrochloric acid forms bis-chloromethyl ether, a carcinogen. Formalin is incompatible with strong oxidizers, alkalis, acids, phenols, urea, oxides, isocyanates, caustics, anhydrides.

Permissible Exposure Limits in Air

NIOSH IDLH = 20 ppm

Conversion factor: 1 ppm = 1.23 milligram per cubic meter.

OSHA PEL: 0.75 ppm TWA; 2 ppm STEL, suspected carcinogen, see 29CFR1910.1048(c).

NIOSH REL: 0.016 ppm TWA; 0.1 ppm Ceiling Concentration [15 min.]; potential carcinogen. Limit exposure to lowest feasible level, See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1] 0.3 ppm/0.37 milligram per cubic meter; sensitizer; Ceiling Concentration, Suspected Human Carcinogen

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.90_A}$ ppm

PAC-2: $\mathbf{14_A}$ ppm

PAC-3: $\mathbf{56_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 0.3 ppm/0.37 milligram per cubic meter TWA; Peak Limitation Category I(2) a momentary value of 1 ppm/1.2 milligram per cubic meter should not be exceeded; [skin: danger of sensitization]; Carcinogen Category 4; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 2 ppm (3 milligram per cubic meter), 1993; Australia: TWA 1 ppm (1.5 milligram per cubic meter); STEL 2 ppm, carcinogen, 1993; Austria: MAK 0.5 ppm (0.6 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium: TWA 1 ppm (1.2 milligram per cubic meter); STEL 2 ppm, carcinogen, 1993; Denmark: TWA 0.3 ppm (0.4 milligram per cubic meter), 1999; France: VME 0.5 ppm, VLE 1 ppm, carcinogen, 1999; Hungary: STEL 0.6 milligram per cubic meter, carcinogen, 1993; the Netherlands: MAC-TGG 1.5 milligram per cubic meter, 2003; Norway: TWA 0.5 ppm (0.6 milligram per cubic meter), 1999; the Philippines: TWA 5 ppm (6 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter, MAC (STEL) 1 milligram per cubic meter, 1999; Russia: TWA 0.5 ppm; STEL 0.5 milligram per cubic meter [skin], 1993; Sweden: NGV 0.5 ppm (0.6 milligram per cubic meter), TGV 1 ppm (1.2 milligram per cubic meter) [skin], 1999; Switzerland: MAK-(W) 0.5 ppm (0.6 milligram per cubic meter), KZG-(W) 1 ppm (1.2 milligram per cubic meter), 1999; Thailand: TWA 3 ppm; STEL 5 ppm, 1993; Turkey: TWA 5 ppm (6 milligram per cubic meter), 1993; United Kingdom: TWA 2 ppm (2.5 milligram per cubic meter), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.3 ppm (sensitizer).Russia has also set MAC values for ambient air in residential areas of 0.035 milligram per cubic meter on a momentary basis and 0.012 milligram per cubic meter on a daily average basis,[43] also cited as 0.003 milligram per cubic meter[35]. Several states have set guidelines or standards for formaldehyde in ambient air[60] ranging from 0 (North Carolina and North Dakota) to 0.77 μ/m^3 (Massachusetts) to 5.0 μ/m^3 (New York) to 7.2 μ/m^3 (Pennsylvania) to 7.5 μ/m^3 (South Carolina) to 12.0 μ/m^3 (Connecticut, South Dakota and Virginia) to 18.0 μ/m^3 (Indiana) to 71.0 μ/m^3 (Nevada) to 75.0 μ/m^3 (Washington).

Determination in Air: Use NIOSH (IV), Method #2016, #2541, #3500, #3800. OSHA Analytical Method ID-205, ID-52.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 41.4 μg/L based on health effects. Russia set a MAC in water bodies used for domestic purposes of 0.01 mg/L[43] also quoted as 0.05 mg/L[35]. Further, they have set a MAC in water bodies used for fishery purposes of 0.25 mg/L. Several states have set guidelines for formaldehyde in drinking water[61] ranging from 0.7 μg/L (New Jersey)[59] to 10.0 μg/L (Maryland) to 30.0 μg/L (California and Maine).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Acute exposure to formaldehyde may result in burns to the skin, eyes, and mucous membranes; lacrimation (tearing), nausea, vomiting (may be bloody); abdominal pain; and diarrhea. Difficulty in breathing; cough, pneumonia, and pulmonary edema may occur. Sensitized people may experience asthmatic reactions, even when exposed briefly. Hypotension (low blood pressure) and hypothermia (reduced body temperature) may precede cardiovascular collapse. Lethargy, dizziness, convulsions, and coma may be noted. Nephritis (inflammation of the kidneys), hematuria (bloody urine), and liver toxicity have been reported. Exposure at concentrations well above the PEL may cause death. The effects may be delayed. *Note:* There is considerable individual variation in sensitivity to formaldehyde.

Inhalation: Irritation of the nose and throat can occur after an exposure of 0.25−0.45 ppm. Levels between 0.4 ppm and 0.8 ppm can give rise to coughing and wheezing, tightness of the chest and shortness of breath. Sudden exposures to concentrations of 4 ppm may lead to irritation of lung and throat severe enough to give rise to bronchitis and laryngitis. Breathing may be impaired at levels above 100 ppm and serious lung damage may occur @ 50 ppm. *Skin:* Direct contact with the liquid can lead to irritation, itching, burning and drying. It is also possible to develop an allergic reaction to the compound following exposure by any route. *Eyes:* Exposure to airborne levels of formaldehyde of 0.4 ppm have brought on tearing and irritation. Small amounts of liquid splashed in the eye can cause damage to the cornea. Eye irritation was reported at levels between 0.05 and 2.0 ppm. *Ingestion:* As little as 1 liquid ounce has resulted in death to humans. Smaller amounts can damage the throat, stomach and intestine resulting in nausea, vomiting, abdominal pain and diarrhea. Accidental exposure may also cause loss of consciousness; lowered blood pressure; kidney damage and, if the person is pregnant, the possibility of the fetus being aborted. LD_{50} (rat, inhalation) = < 1 ppm.

Long-Term Exposure: Inhalation can result in respiratory congestion with associated coughing and shortness of breath. Repeated skin contact can lead to drying and scaling. Some individuals may experience allergic reactions after initial contact with the chemical. Subsequent contact may cause skin rashes and asthma; and reactions may become more severe if exposure persists. Long term inhalation of high levels of formaldehyde vapor (14 ppm) in rats resulted in an elevated incidence of cancer of the nose. Genetic damage from exposure has been shown in bacteria and some insects. Whether it causes effects in humans is uncertain. May be carcinogenic to humans.

Points of Attack: Eyes, respiratory system. *Cancer site:* nasal cancer.

Medical Surveillance: OSHA Mandated Medical Tests: pulmonary function tests: forced vital capacity, forced expiratory volume (1 second), forced expiratory flow rate. Niosh lists the following tests: pulmonary function tests: forced vital capacity, forced expiratory volume (1 second), forced expiratory flow rate; whole blood (chemical/metabolite); chest X-ray; pulmonary function tests: pre- and postshift photopatch testing; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Prevention of intoxication may be easily accomplished by supplying adequate ventilation and protective clothing. Barrier creams may also be helpful. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Formalin (as formaldehyde): Prevent skin contact. **8 hours:** butyl rubber (gloves, suits, boots), nitrile rubber (gloves, suits, boots), Viton (gloves, suits), Saranex coated suits, Barricade coated suits; CPF3 suits; **4 hours:** Teflon (gloves, suits, boots), 4*H* and Silver Shield gloves, Responder suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Formaldehyde (1910.1048): < or = 7.5 ppm (parts per million) (10 × PEL): Full-facepiece respirator with cartridges or canisters specifically approved for protection against formaldehyde*. < or = 75 ppm (100 × PEL) (1) Full-face mask respirator with chin style or chest- or back-mounted type with industrial size canister specifically approved for protection against formaldehyde; or (2) Type C supplied-air respirator, demand type or continuous flow type, with full facepiece, hood, or helmet. >75 ppm (100 × PEL) or unknown concentrations (emergencies) (1) SCBA with positive-pressure full-facepiece; or (2) Combination supplied-air, full-facepiece positive-pressure respirator with auxiliary self-contained air supply.

Firefighting: SCBA with positive-pressure in full facepiece. *Escape*: (1) SCBA in demand or pressure-demand mode or (2) Full-face mask respirator with chin-style or front- or back-mounted type industrial size canister specifically approved for protection against formaldehyde.

*A half-mask respirator with cartridges specifically approved for protection against formaldehyde can be substituted for the full-facepiece respirator providing that effective gas-proof goggles are provided and used in combination with the half-mask respirator.

***Firefighting**:* SCBA with positive-pressure in full facepiece. *Escape* (1) SCBA in demand or pressure-demand mode; or (2) Full-face mask respirator with chin-style or front- or back-mounted type industrial size canister specifically approved for protection against formaldehyde.

Storage: Check oxygen content prior to entering storage area. Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. UN2209 Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Formaldehyde must be stored to avoid contact with oxidizers (such as permanganates, nitrates, peroxides, chlorates and perchlorates), and alkaline materials, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks or flames. Sources of ignition, such as smoking and open flames, are prohibited where formaldehyde is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically pump liquid from drums or other storage containers to process containers. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1198 Formaldehyde solutions, flammable, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. UN2209 Formaldehyde solutions, with not <25% formaldehyde, Hazard class: 8; Labels: 8-Corrosive material. UN3077 For solids containing varying amounts of formaldehyde [possibly y as paraformaldehyde (polymers of formula $HO(CH_2O)xH$ where x averages ~30)]: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Shut off ignition sources; no flares, smoking or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors; do not get water inside container. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Use fluorocarbon water spray, cellosize, and hycar to diminish vapors. Use sodium carbonate, ammonium hydroxide or sodium sulfite to neutralize spill. Use universal gel, fly ash, universal sorbent material, or cement powder to absorb the spill. Keep formaldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas or a combustible liquid. Thermal decomposition products may include oxides of carbon. *Small fires:* dry chemical, carbon dioxide; water spray or foam. *Large fires:* water spray, fog or foam. Move container from fire area if you can do so without risk. Do not get water inside container. Spray cooling water on containers exposed to flames until well after fire is out. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration in solution of combustible solvent[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+, E, Xi; risk phrases: R1; R10; R19; R26/27/28; R36/37/38; R50/53; safety phrases: S13; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Formaldehyde cyanohydrin is a colorless, odorless, oily liquid. Sweet taste (very highly toxic; do not test). Molecular weight = 57.06; boiling point = 186°C (slight decomposition); freezing/melting point ≤ −72°C; Flash point ≥93°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Soluble in water.

Potential Exposure: Formaldehyde cyanohydrin is used in the manufacture of intermediates in pharmaceutical production and as a component of synthetic resins as a chemical intermediate for organic compounds, and as a solvent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and exposure to heat. Unless stabilized with a weak acid solution, traces of alkalis may cause violent polymerization.

Permissible Exposure Limits in Air

NIOSH REL: (nitriles) 2 ppm/5 milligram per cubic meter Ceiling Concentration, not to be exceeded in any 15-minute work period. PAC* Ver. 29[138]

PAC-1: 0.24 ppm

PAC-2: 2.6 ppm

PAC-3: 11 ppm

Sweden: NGV 1 ppm (5 milligram per cubic meter), KTV 2 ppm (10 milligram per cubic meter) [skin], 1993; Turkey: TWA 1 ppm (5 milligram per cubic meter); STEL 2 ppm [skin], 1993

Determination in Air: See NIOSH Criteria Document 78-212 *NITRILES*[18]

Routes of Entry: Inhalation, skin absorption, ingestion, eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Formaldehyde cyanohydrin is extremely toxic. It can be fatal if inhaled, ingested, or absorbed through the unbroken skin. The symptoms are similar to cyanide poisoning. Odor of bitter almonds on patient's breath may or may not be present. Irritates eyes, skin, respiratory system. Headache, dizziness, weakness, giddiness, confusion, convulsions, vertigo, dyspnea (breathing difficulty), abdominal pain; nausea, and vomiting may follow exposure. Respiration may initially be rapid, then slow and labored; followed by coma and convulsions. Exposure by any route should be avoided; may have fatal consequences; death from asphyxiation may occur similar to that resulting from hydrogen cyanide.

Long-Term Exposure: Repeated exposure may cause personality changes of depression, anxiety, or irritability. Prolonged or repeated exposure may damage the nervous system; affect respiratory system; cardiovascular system. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Eyes, skin, respiratory system; central nervous system; cardiovascular system.

Medical Surveillance: Blood test for cyanide. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. *Speed in removing material from skin is of extreme importance*. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH: *up to 20 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 50 ppm:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 100 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 250 ppm:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator[52] under an inert atmosphere and away from all alkaline materials. Where possible, automatically pump liquid from storage containers to process containers.

Shipping: UN3276 Nitriles, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required, Potential Inhalation Hazard (Special Provision 5). UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Build dikes to contain flow as necessary. Use water spray to disperse vapors and dilute standing pools of liquid. Avoid breathing vapors. Keep upwind. Avoid bodily contact with the material. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen cyanides and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or halon extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: Not listed. Carcinogenesis studies; test completed (peer review), October 2000. United States Environmental Protection Agency Gene-Tox Program, Negative: Cell transformation-RLV F344 rat embryo

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R36/37/38; R61; R62; R63; safety phrases: S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Formamide is a colorless, viscous liquid. Faint ammonia-like odor. Molecular weight = 45.05; specific gravity (H_2O:1) = 1.13; boiling point = (decomposes) 210.5°C; freezing/melting point = 2.5°C; vapor pressure = 0.1 mmHg @ 30°C; 29.7 mmHg @ 129°C; flash point = 154°C[17]. Autoignition temperature ≥500°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Good solubility in water; hygroscopic.

Potential Exposure: Formamide is a powerful solvent. It is also used as an intermediate in pharmaceutical manufacture.

Incompatibilities: Forms hydrocyanic acid with water solutions. Hygroscopic (absorbs moisture from air). Incompatible with nonoxidizing mineral acids; strong acids; ammonia, cresols, iodine, isocyanates, oleum, phenols, pyridine, sulfur trioxide; oxidizers, iodine, pyridine. Formamide decomposes on heating @ 180°C forming ammonia, water, carbon monoxide and hydrogen cyanide. Attacks metals, such as aluminum, iron, copper, brass, lead, and natural rubber. Thermal decomposition may release deadly hydrogen cyanide. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.85 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 10 ppm/15 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 10 ppm/18 milligram per cubic meter TWA [skin]

PAC Ver. 29[138]
PAC-1: 30 ppm
PAC-2: 110 ppm
PAC-3: 650 ppm
DFG MAK: [skin]; No numerical value established.
Australia: TWA 10 ppm (15 milligram per cubic meter) [skin], 1993; Belgium: TWA 10 ppm (18 milligram per cubic meter) [skin], 1993; Finland: TWA 20 ppm (37 milligram per cubic meter); STEL 30 ppm (55 milligram per cubic meter) [skin], 1999; France: VME 20 ppm (30 milligram per cubic meter), 1999; Norway: TWA 10 ppm (18 milligram per cubic meter), 1999; Russia: STEL 3 milligram per cubic meter, 1993; Switzerland: MAK-W 10 ppm (18 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 16 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 ppm [skin]. Several states have set guidelines or standards for formamide in ambient air[60] ranging from 100 μ/m^3 (New York) to 300 μ/m^3 (Florida) to 300−450 μ/m^3 (North Dakota) to 480 μ/m^3 (Virginia) to 600 μ/m^3 (Connecticut) to 714 μ/m^3 (Nevada) to 750 μ/m^3 (South Carolina).

Determination in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 414 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Formamide irritates the skin, eyes, and mucous membranes. Contact may cause eye burns. Exposure can cause skin irritation and a rash. May affect the central nervous system.

Long-Term Exposure: Formamide may also damage the testes (male reproductive glands). There is limited evidence that formamide is a teratogen in animals and may have toxic effects upon human reproduction.

Points of Attack: Blood, eyes, skin, respiratory system; cardiovascular system, central nervous system; reproductive system.

Medical Surveillance: If illness or overexposure is suspected, medical attention is recommended. Blood and cardiovascular tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 20 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and other incompatible materials listed above.

Shipping: UN2810 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2810: *Isolation Distance, Spill*: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep formamide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol-resistant foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent and dispose by burning in a furnace equipped with an alkali scrubber for the exit gases[22].

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant as formetanate.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xi; risk phrases: R26; R28; R43; R50/53; safety phrases: S1/2; S24; S28; S29/35; S37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Formetanate hydrochloride is a white or yellowish, crystalline solid or powder with a faint odor. Molecular weight = 257.75; freezing/melting point = (decomposes) 200–202°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Highly soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this plant insecticide, acaricide and miticide.

Incompatibilities: Carbamates are incompatible with strong acids and bases, and especially incompatible with strong reducing agents such as hydrideds and active metals. Contact with active metals or nitrides form flammable gaseous hydrogen. Incompatible with strongly oxidizing acids, peroxides, and hydroperoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.12 milligram per cubic meter

PAC-2: 1.3 milligram per cubic meter

PAC-3: 7.9 milligram per cubic meter

Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: May be fatal if inhaled or swallowed. Diarrhea, nausea, vomiting, excessive salivation; headache, pinpoint pupils and uncoordinated muscle movements are all common symptoms. Extremely toxic to humans. Not absorbed through contact with skin. Inhalation or ingestion may cause poisoning. Inhibits cholinesterase activity so effects are in relation to action on nervous system and can result in death. LD_{50} = 20 mg/kg[77]

Long-Term Exposure: May cause skin allergy.

Medical Surveillance: Evaluation by a dermatologist. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: *Isolation Distance, Spill*: 25 m/ 75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind and keep out of low areas. Do not touch spilled material or breathe the dust, vapors, or fumes from burning materials. Do not handle broken packages without protective equipment. Wash away any material that may have contacted the body with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Extinguish fire using agent suitable for type of surrounding fire, as the material itself does not burn or burns with difficulty. Use water in flooding quantities as a fog. Use alcohol foam, carbon dioxide; or dry chemical. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Formic acid is a colorless, flammable, fuming liquid. Pungent odor. Molecular weight = 46.03; specific gravity (H_2O:1) = 1.22 (90% solution); boiling point = 106.7°C (90% solution); vapor pressure = 35 mmHg @ 20°C; flash point = 69°C; (90% solution) 50°C; Autoignition temperature = 434°C. Explosive limits: LEL = 18%; UEL: 57%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Soluble in water.

Potential Exposure: Formic acid is a strong reducing agent and is used as a decalcifier. It is used in pharmaceuticals; in dyeing textiles and finishing color-fast wool; electroplating, coagulating latex rubber; regeneration old rubber, and dehairing, plumping, and tanning leather. It is also used in the manufacture of acetic acid, airplane dope; allyl alcohol; cellulose formate; phenolic resins; and oxalate; and it is used in the laundry, textile, insecticide, refrigeration, and paper industries; as well as in drug manufacture.

Incompatibilities: Vapors may form explosive mixture with air. A medium strong acid and a strong reducing agent. Violent reaction with oxidizers, furfuryl alcohol; hydrogen peroxide; nitromethane. Incompatible with strong acids; bases, ammonia, aliphatic amines; alkanolamines, isocyanates, alkylene oxides; epichlorohydrin. Decomposes on heating and on contact with strong acids forming carbon monoxide. Carbamates are incompatible with strong acids and bases, and especially incompatible with strong reducing agents such as hydrideds and active metals. Contact with active metals or nitrides form flammable gaseous hydrogen. Incompatible with strongly oxidizing acids, peroxides, and hydroperoxides. Attacks metals: aluminum, cast iron and steel; many plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 30 ppm

Conversion factor: 1 ppm = 1.88 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/9 milligram per cubic meter TWA

NIOSH REL: 5 ppm/9 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/9.4 milligram per cubic meter TWA; 10 ppm/19 milligram per cubic meter STEL

PAC* Ver. 29[138]

PAC-1: $\mathbf{3_A}$ ppm

PAC-2: $\mathbf{25_A}$ ppm

PAC-3: $\mathbf{250_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 5 ppm/9.5 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group C

Arab Republic of Egypt: TWA 5 ppm (9 milligram per cubic meter), 1993; Australia: TWA 5 ppm (9 milligram per cubic meter), 1993; Austria: MAK 5 ppm (9 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (9.4 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (9 milligram per cubic meter), 1999; France: VLE 5 ppm (9 milligram per cubic meter), 1999; Hungary: TWA 5 milligram per cubic meter; STEL 8 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 9 milligram per cubic meter, 2003; Norway: TWA 5 ppm (9 milligram per cubic meter), 1999; the Philippines: TWA 5 ppm (9 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC (STEL) 15 milligram per cubic meter, 1999; Russia: TWA 5 ppm; STEL 1 milligram per cubic meter [skin] 1993; Sweden: TWA 3 ppm (5 milligram per cubic meter); STEL 15 ppm (45 milligram per cubic meter) [skin] 1999; Switzerland: MAK-W 5 ppm (9 milligram per cubic meter); STEL 10 ppm (18 milligram per cubic meter), 1999; United Kingdom: TWA 5 ppm (9.6 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 ppm. Several states have set guidelines or standards for formic acid in ambient air[60] ranging from 30 μ/m^3 (New York) to 90 μ/m^3 (Florida and North Dakota) to 150 μ/m^3 (Virginia) to 180 μ/m^3 (Connecticut) to 214 μ/m^3 (Nevada) to 225 μ/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #2011 or OSHA Analytical Method ID-186 SG.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 124 μg/L based on health effects.

Determination in Water: Octanol−water partition coefficient: Log K_{ow} = 0.41.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Formic acid is very corrosive to the eyes, skin, and respiratory tract. *Inhalation:* Workers exposed to 15 ppm experience nausea. Other symptoms include irritation of the nose, throat and lungs; coughing, runny nose and tearing eyes. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* Concentrated solutions may cause severe irritation, burning and blistering. Accidental exposure has resulted in death. *Eyes:* May cause irritation and tearing. Concentrated solutions may cause severe chemical burns. *Ingestion:* Corrosive. May affect the energy metabolism, causing acidosis. May cause salivation, vomiting, burning sensation in the mouth; vomiting of blood; diarrhea and pain. In severe cases, a person may go into shock and develop difficulty in breathing. Death may result. Animal data suggest that ingestion of about 3 oz may be fatal to a 150 lb individual.

Long-Term Exposure: Prolonged or repeated exposure to formic acid may cause skin irritation and allergy with rash and itching. May affect the kidneys. May cause genetic changes in living cells.

Points of Attack: Respiratory system, lungs, skin, kidneys, liver, eyes.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Consideration should be given to possible irritant effects on the skin, eyes, and lungs in any placement or periodic examinations. Lung function tests. Kidney function tests checking for blood and urine. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. **8 hours:** butyl rubber (gloves, suits, boots), Neoprene rubber (gloves, suits, boots), Saranex coated suits, Barricade coated suits; Responder suits, Trellchem HPS suits; **4 hours:** polyvinyl chloride (gloves, suits, boots), Teflon (gloves, suits, boots). Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA: $>\mathbf{2}_{\mathbf{A}}$ ppm **ERPG** (Emergency Response Planning Guideline). NIOSH: *30 ppm:* Sa (APF = 10) (any supplied-air respirator); or; or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. (3) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Keep in sealed containers in well-ventilated area. Protect from heat or flame and materials listed above under "Incompatibilities." Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1779 Formic acid, with >85% acid by mass, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added solvent[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 219-818-6 [*Annex I Index No.:* 015-057-00-7]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Neurotoxin (cumulative), Combustible, Suspected reprotoxic hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R21/22; R33; R36/37/38; R34; R40; R45; R51; safety phrases: S2; S22; S26; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Formothion is an odorless, yellowish viscous oil or crystalline mass. Molecular weight = 257.28; freezing/melting point = 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: Formothion is an insecticide and acaricide for use on crops and ornamentals. Formothion is not currently produced commercially in the U.S.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.1 milligram per cubic meter

PAC-2: 24 milligram per cubic meter

PAC-3: 140 milligram per cubic meter

Russia[35,43] set a MAC in work-place air of 0.5 milligram per cubic meter and a MAC in ambient air in residential areas of 0.01 milligram per cubic meter on a momentary basis and 0.006 milligram per cubic meter on a daily average basis.

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.004 mg/L (4 μg/L).

Routes of Entry: Inhalation, absorbed by the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Early symptoms of poisoning include: headache, dizziness, weakness, perspiring, nausea, vomiting, and sensation of tightness in chest. Chronic low doses may produce symptoms similar to influenza. Formothion is one of the least toxic systemic organophosphates. Formothion is a compound of low to moderate toxicity. It causes the depression of cholinesterase leading to accumulation of acetylcholine in the nervous system; which is believed to be responsible for the symptoms. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, profound weakness; nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Speed in removing the material form the skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA: >0.025 milligram per cubic meter Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from. alkaline materials. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter material. This compound is an organophosphorus insecticide. Some of these materials may burn but none of them ignite readily. Fire and runoff from fire control water may produce irritating or poisonous gases. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Not likely a human carcinogen

Hazard Alert: Poison, Neurotoxin (cumulative), Possible sensitization hazard (skin), Organometallic, Primary irritant (w/o allergic reaction), Agricultural chemical. Listed for Tier 1 screening as an endocrine disruptor[88].

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

DOT Inhalation Hazard Chemicals as organophosphates

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R33; R36/37/38; R41; R43; safety phrases: S2; S26; S39; S46 (see Appendix 4)

Description: White, crystalline solid or powder. Odorless. Molecular weight = 354.101; specific gravity (H_2O:1) = 1.55; boiling point = (decomposes); freezing/melting point = 214°C; vapor pressure = 1×10^{-7} mmHg @ 20°C. Henry's Law constant = 3.2×10^{-15} atm m^3/mol @ 25°C (est)[83] Highly soluble in water; solubility = 120 g/L.

Potential Exposure: Organophosphate fungicide used on fruits, vegetables and nut crops; also on ornamentals and greenhouse products.

Incompatibilities: In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas. Contact with oxidizers can cause the release of toxic oxides of phosphorus. Decomposes in temperatures above 260°C.

Permissible Exposure Limits in Air:

Determination in Air: OSHA versatile sampler-2; Toluene/ Acetone; Gas chromatography/Flame ionization detection; NIOSH IV[18], Method #5600, Organophosphorus Pesticides

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50−200[Al]μg/L; State Drinking Water Standards: California 1000[Al]μg/L; State Drinking Water Guidelines: Arizona 73 [Al]μg/L; Maine 1430 [Al]μg/L; California 200 [Al]μg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -3$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation; dermal and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: A severe eye irritant. Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. LD_{50} (oral, rat) = > 5 g/kg[83]; LD_{50} (dermal, rat) = 600 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase

Medical Surveillance: Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes:* Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin:* Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. *Ingestion:* Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 oz of water do NOT induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *UNCONSCIOUnited States OR HAVING CONVULSIONS,* do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water.* Do NOT give activated charcoal before or with ipecac syrup. *Inhalation:* Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel.* Administer atropine, 2 mg (1/30 gr) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10-minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Notes to physician or authorized medical personnel*: *N*-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 gm in 100 mL of sterile water or in 5% dextrose and water, intravenously, slowly, in 15−30 minutes; if sufficient fluid is not available, give 1 gm of 2-PAMCI in 3 mL of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also Diazepam, an anticonvulsant, might be considered. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical, all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Decomposes in temperatures above 260°C. Thermal decomposition products may include oxides of phosphorus, nitrogen, metal and carbon. May be fatal if inhaled, ingested or absorbed through skin. Inhalation or contact with some of these materials will irritate or burn skin and eyes. Vapors may cause dizziness or suffocation. *Small fires:* dry chemical, carbon dioxide; water spray; or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destruction by alkali hydrolysis or incineration. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Fosthietan F:0470

Formula: $C_6H_{12}NO_3PS_2$

Synonyms: AC 64475; Acconem; CL64475; (Diethoxyphosphinylimino)-1,3-dithietane; Diethoxyphosphinylimino-2-dithietanne-1,3 (French); 1,3-Dithietan-2-ylidenephosphoramidic acid diethyl ester; Geofos; NEM-A-TAK

CAS Registry Number: 21548-32-3

HSDB Number: 6449

RTECS Number: NJ6490000

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 244-437-7 [*Annex I Index No.:* 015-124-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Poison, Neurotoxin (cumulative), Agricultural chemical.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R27/28; R33; safety phrases: S1/2; S36/37; S41; S45 (see Appendix 4).

Description: Fosthietan is a pale yellow oil. It has a mercaptan-like odor. Molecular weight = 241.28; specific gravity (water = 1) = 1.3 g/cm^3 @ 25°C; vapor pressure = 6.5×10^{-6} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 1. Henry's Law constant = 4.11×10^{-11} atm m^3/mol @ 25°C (est)[72] Moderately soluble in water.

Potential Exposure: Fosthietan is used as a nematocide and insecticide. Not currently registered as a pesticide in the U.S.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.43 milligram per cubic meter

PAC-2: 4.7 milligram per cubic meter

PAC-3: 28 milligram per cubic meter

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Fosthietan is a liquid organophosphorus insecticide. Acutely toxic, possibly fatal, on contact to the skin or if swallowed. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. LD_{50} (oral-rat) = < 5 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkaline material. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

RTECS Number: DD9010000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN2588 (Pesticides, solid, toxic, n.o.s.)/151

EC Number: 223-404-0 [*Annex I Index No.:* 613-016-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Poison, Environmental hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R50/53; safety phrases: S2; S22; S29; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Fuberidazole is a crystalline powder. Molecular weight = 184.21; freezing/melting point = 285°C (decomposition). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Very slightly soluble in water. Decomposes ~285−290°C.

Incompatibilities: Fuberidazole is incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid halides, anhydrides, epoxides, halogenated organics, isocyanates, peroxides, phenols (acidic). Fuberidazole is a benzimidazole and behaves as an amine. Amines are chemical bases. They neutralize acids to form salts plus water. These acid-base reactions are exothermic. The amount of heat that is evolved per mole of amine in a neutralization is largely independent of the strength of the amine as a base. Amines may be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated by amines in combination with strong reducing agents, such as hydrides[101].

Potential Exposure: Fuberidazole, a benzimidazole, uses include cereal seed dressing; and fungicidal, nonmercurial seed dressing with special action against fusarium. Not registered as a pesticide in the U.S.A.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 3.3 milligram per cubic meter

PAC-3: 15 milligram per cubic meter

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.7$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Fuberidazole is classified as moderately toxic. Its probable oral lethal dose in humans is 0.5−5 g/kg or between 1 oz and 1 pt for a 70 kg (150 lb) person. LD_{50} (oral-rat) = 1100 mg/kg[9]; LC_{50} (rat) = 0.33 mg/L.

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA; or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled material;

stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. This material is a combustible solid. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers.If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R36; R62; safety phrases: S2; S26; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Fumaric acid is a colorless to white, odorless crystalline powder. Fruity-acidic taste. Molecular weight = 116.08; specific gravity (H_2O:1) = 1.64 @ 20°C; boiling point = 290°C; Sublimation temperature = 200°C; freezing/melting point = 287°C; vapor pressure = 1.54×10^{-4} mmHg @ 25°C; flash point = 230°C; Autoignition temperature = 737°C; also listed as >156°F/ >69°C; Autoignition temperature (dust cloud) = 740°C. Hazard Ranking (based on NFPA 704 M Hazard identification): Health 2, flammability 1, reactivity 0. Slightly soluble in water; solubility = < 1%.

Potential Exposure: Fumaric acid is used in production of resins, polyesters, plasticizers, and alkyl surface coatings; as a food additive; as an antioxidant in resins; to make dyes.

Incompatibilities: Dust cloud from powder or granular form mixed with air can explode. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides; epichlorohydrin. Decomposes above 350°C forming toxic fumes of maleic anhydride.

Permissible Exposure Limits in Air

PAC Ver. 27; No value in Ver. 29[138]

PAC-1: 28 milligram per cubic meter

PAC-2: 310 milligram per cubic meter

PAC-3: 1800 milligram per cubic meter

Determination in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol–water coefficient: Log K_{ow} =< 1. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation. Absorbed through the skin.
Harmful Effects and Symptoms
Short-Term Exposure: Irritates the eyes, skin, and respiratory tract.
Long-Term Exposure: Repeated exposure may cause liver damage.
Points of Attack: Liver.
Medical Surveillance: Liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.
Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and incompatible materials listed above.
Shipping: Not regulated as a hazardous mateial.
Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Thermal decomposition products may include maleic anhydride and oxides of carbon. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Furan is a colorless liquid; turns brown on standing. Strong ethereal odor. Molecular weight = 68.07; specific gravity (H_2O:1) = 0.95 @ 20°C; boiling point = 32°C; freezing/melting point = −85.61°C; vapor pressure = 750 mmHg @ 31°C; flash point = −36°C. Explosive limits: LEL = 2.3%; UEL: 14.3%[17]. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 1. Insoluble in water.

Potential Exposure: Furan is used as a chemical intermediate in the production of herbicides and pharmaceuticals; for making tetrahydrofuran; in formation of lacquers; as a solvent for resins in organic synthesis, especially for pyrrole, thiophene.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, amines, strong bases, reducing agents. Unless stabilized with an inhibitor, air exposure forms unstable peroxides.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: 0.62 ppm

PAC-2: $\mathbf{6.8_A}$ ppm

PAC-3: $\mathbf{19_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK:[skin] Carcinogen Category 2

Russia: STEL 0.5 milligram per cubic meter [skin] 1993

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.2 mg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.3. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate and burn the skin and eyes. Vapors can irritate the respiratory tract and are a central nervous system depressant. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headache, dizziness, shortness of breath; unconsciousness, and suffocation are among the symptoms. The vapors are narcotic. Acute exposure to furan by inhalation may involve both reversible and irreversible changes. Acute exposure by ingestion or skin absorption, as well as chronic exposure, are associated with high toxicity.

Long-Term Exposure: Furan may be a carcinogen since it has been shown to cause cancer of the liver and white blood cells in animals. May cause skin allergy. May damage the liver and kidneys.

Points of Attack: Skin, liver, kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical resistant suit.

Respirator Selection: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator[52]. Keep in a tightly closed container under an inert atmosphere and protect from light for long-term storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2389 Furan, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Avoid breathing vapors. Keep upwind. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. The exposure concentration limit of 10 ppm together with the low boiling point of furan requires that adequate ventilation be provided in areas handling this chemical. Establish forced ventilation to keep levels below explosive limit. Contact with liquid must be avoided since this chemical can be absorbed through the skin. Keep furan out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Thorough washing with soap and water followed by prolonged rinsing should be done immediately after accidental contact. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Water may be ineffective. *Small fires:* use dry chemical, carbon dioxide; water spray; or alcohol foam. *Large fires:* water spray, fog, or alcohol foam. Move container from fire area if this can be accomplished without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fires in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Isolate for 1/2 mi in all directions if a tank car or truck is involved. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Furfural is a colorless to yellow aromatic heterocyclic aldehyde with an almond-like odor. Turns amber on exposure to light and air. Molecular weight = 96.09; specific gravity (H_2O:1) = 1.16 @ 20°C; boiling point = 161.7°C; freezing/melting point = −38.1; vapor pressure = mmHg 1.7 @ 16°C; flash point = 60°C; Autoignition temperature = 316°C. Explosive limits: LEL = 2.1%; UEL: 19.3%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Soluble in water; solubility = 8%.

Potential Exposure: Furfural is used for lube oil refining and butadiene extraction; as a solvent for wood resin, nitrated cotton, cellulose acetate, and gums; in the production of phenolic plastics, thermosetting resins, refined petroleum oils, dyes, and varnishes; in the manufacture of pyromucic acid, vulcanized rubber, insecticides, fungicides, herbicides, germicides, furan derivatives, polymers, and other organic chemicals.

Incompatibilities: May form explosive mixture with air. Acids and bases can cause polymerization, causing fire or explosion hazard. Reacts violently with oxidants. Incompatible with strong acids; caustics, ammonia, aliphatic amines; alkanolamines, alromatic amines; oxidizers. Attacks many plastics.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

OSHA PEL: 5 ppm/20 milligram per cubic meter TWA [skin]

NIOSH REL: None, see Appendix D

ACGIH TLV[1]: 2 ppm/7.9 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans; BEI: 200 mg/g creatinine, end-of-shift; Total fuoric acid in urine.

PAC* Ver. 29[138]

PAC-1: $\mathbf{2_E}$ ppm

PAC-2: $\mathbf{10_E}$ ppm

PAC-3: $\mathbf{100_E}$ ppm

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

DFG MAK: [skin] Carcinogen Category 3B

Australia: TWA 2 ppm (8 milligram per cubic meter) [skin], 1993; Austria: MAK 5 ppm (20 milligram per cubic meter), 1999; Belgium: TWA 2 ppm (7.9 milligram per cubic meter) [skin], 1993; Denmark: TWA 2 ppm (7.9 milligram per cubic meter) [skin], 1999; Finland: TWA 2 ppm (8 milligram per cubic meter) [skin], 1999; France: VLE 2 ppm (8 milligram per cubic meter), 1999; Japan: 2.5 ppm (9.8 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 8 milligram per cubic meter, 2003; Norway: TWA 2 ppm (8 milligram per cubic meter), 1999; the Philippines: TWA 5 ppm (20 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 10 milligram per cubic meter, MAC (STEL) 40 milligram per cubic meter, 1999; Russia: TWA 2.5 ppm; STEL 10 milligram per cubic meter [skin], 1993; Sweden: NGV 2 ppm (8 milligram per cubic meter), KTV 5 ppm (20 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 2 ppm (8 milligram per cubic meter) [skin], 1999; Turkey: TWA 5 ppm (20 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 2 ppm (8 milligram per cubic meter); STEL 5 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic: MAC 2.5 ppm. Russia[35,43] set a MAC in ambient air of residential areas of 0.05 milligram per cubic meter both on a momentary and on a daily average basis. Several states have set guidelines or standards for furfural in ambient air[60] ranging from 26.7 μ/m^3 (New York) to 80.0 μ/m^3 (Florida) to 160.0 μ/m^3 (Connecticut) to 190 μ/m^3 (Nevada) to 200.0 μ/m^3 (South Carolina) to 80.0−400.0 μ/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method (IV) #2529 or OSHA Analytical Method 72.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Routes of Entry: Inhalation of vapor; percutaneous absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may cause skin irritation, causing rash and a burning sensation. Liquid and concentrated vapor are irritating to the eyes, skin, upper respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Workers chronically exposed to the vapor have had complaints of headache, fatigue, itching of the throat; lacrimation, loss of the sense of taste; numbness of the tongue; and tremor. Occupational overexposure is relatively rare due to the liquid's low vapor pressure, and symptoms usually disappear rapidly after removal from exposure.

Long-Term Exposure: Eczematous dermatitis as well as skin sensitization, resulting in allergic contact dermatitis and photosensitivity, may develop following repeated exposure. The substance may have effects on the liver. Furan causes mutations. Repeated exposure may cause loss of taste, numbness of the tongue; and may cause headaches, tiredness, tremors, itchy throat; watery eyes. Long term exposure may cause skin to sunburn more easily.

Points of Attack: Eyes, respiratory system; skin.

Medical Surveillance: NIOSH lists the following tests: urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift. For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. **8 hours:** butyl rubber (gloves, suits, boots), 4*H* and Silver Shield gloves; Barricade coated suits; CPF3 suits, Trellchem HPS$^{\text{suits; Trychem 1000}}$ suits; **4 hours:** PVA, Saranex coated suits. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *50 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Furfural must be stored to avoid contact with oxidizing materials (such as perchlorates, peroxides, chlorates, nitrates, and permanganates) and strong acids because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where furfural is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist.

Shipping: UN1199 Furaldehyde, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. Keep furfural out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Furfural alcohol is a colorless to amber liquid that darkens on exposure to light. It has a faint, burning odor. Molecular weight = 98.1; specific gravity (H_2O:1) = 1.13 @ 20°C; Boiling point: 171°C; freezing/melting point: −15°C; vapor pressure = 0.75 mmHg @ 20°C; flash point = 65°C (cc); 75°C (oc); Autoignition temperature = 491°C. Explosive limits: LEL = 1.8%; UEL: 16.3%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 2, reactivity 1. Soluble in water.

Potential Exposure: Used as a starting monomer in the production of furan resins and used to produce tetrahydrofurfural alcohol (THFA).

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with acids can cause polymerization. Strong reaction with oxidizers. Incompatible with alkaline earth and alkali metals; strong caustics; aliphatic amines; isocyanates, acetaldehyde, benzoyl peroxide; chromic acid, chromium trioxide; cyanoacetic acid; dialkylzincs, dichlorine oxide; ethylene oxide; hydrogen peroxide; isopropyl chlorocarbonate; lithium tetrahydroaluminate; nitric acid; nitrogen dioxide; pentafluoroguanidine, phosphorus pentasulfide; tangerine oil; triethylaluminum, triisobutylaluminum. Attacks some plastics, coatings and rubber.

Permissible Exposure Limits in Air
NIOSH IDLH = 75 ppm
OSHA PEL: 50 ppm/200 milligram per cubic meter TWA [skin]
NIOSH REL: 10 ppm/40 milligram per cubic meter TWA; 15 ppm/60 milligram per cubic meter STEL [skin]
ACGIH TLV[1]: 10 ppm/40 milligram per cubic meter TWA; 15 ppm/60 milligram per cubic meter STEL [skin
PAC Ver. 29[138]
PAC-1: 15 ppm
PAC-2: 42 ppm
PAC-3: 250 ppm
DFG MAK: 10 ppm/41 milligram per cubic meter TWA; Peak Limitation Category I(1) [skin]
Australia: TWA 10 ppm (40 milligram per cubic meter); STEL 15 ppm [skin], 1993; Austria: MAK 5 ppm (20 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (40 milligram per cubic meter); STEL 15 ppm [skin], 1993; Denmark: TWA 5 ppm (20 milligram per cubic meter) [skin], 1999; Finland: TWA 5 ppm (20 milligram per cubic meter); STEL 10 ppm (40 milligram per cubic meter) [skin], 1999; France: VME 10 ppm (40 milligram per cubic meter) [skin], 1999; Hungary: STEL 8 milligram per cubic meter [skin], 1993; the Netherlands: MAC-TGG 20 milligram per cubic meter [skin], 2003; Norway: TWA 5 ppm (20 milligram per cubic meter), 1999; the Philippines: TWA 50 ppm (200 milligram per cubic meter), 1993; Russia: TWA 5 ppm; STEL 0.5 milligram per cubic meter [skin], 1993; Sweden: NGV 5 ppm (20 milligram per cubic meter), KTV 10 ppm (40 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (40 milligram per cubic meter) [skin], 1999; Turkey: TWA 50 ppm (200 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (20 milligram per cubic meter); STEL 15 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 15 ppm [skin]

Determination in Air: Use NIOSH Analytical Method #2505.

Determination in Water: Octanol—water coefficient: Log $K_{ow} = < 0.3$. Unlikely to bioaccumulate in marine organisms.

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Causes tearing of the eyes, dizziness, nausea, diarrhea, diuresis; vomiting, dermatitis. High exposures may cause respiratory and body temperature depression, with a lowering of consciousness.

Long-Term Exposure: Removes the skins natural oils, causing redness and itching. May affect the central nervous system.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: NIOSH lists the following tests: expired air; pulmonary function tests. Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Prevent skin contact. **8 hours:** 4*H* and Silver Shield gloves. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *75 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Metal containers involving the transfer of 5 gal or more of ethyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl acetate. Store in containers that are properly labeled with health hazard information and safe handling procedures. Wherever ethyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Furfuryl alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and any acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where furfuryl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever furfuryl alcohol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2874 Furfuryl alcohol, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a more flammable solvent.

G

Gallium G:0050

Formula: Ga
Synonyms: Elemental gallium
CAS Registry Number: 7440-55-3
HSDB Number: 6956
RTECS Number: LW8600000
UN/NA & ERG Number: UN2803/172
EC Number: 231-163-8

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive, Strong reducing agent, Suspected of causing genetic defects.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, T, Xi; risk phrases: R23/24/25; R34; R36/37/38; R62; safety phrases: S26; S27; S28; S36/37/39; S41; S45 (see Appendix 4)

Description: Gallium is a lustrous, silvery liquid, metal, or gray solid. Molecular weight = 69.72; specific gravity (H_2O:1) = 5.9 @ 20°C; boiling point = 2403°C; freezing/melting point = 30°C. Hazard identification (based on NFPA-704 M Rating System): (metal) Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in preparing such semiconductor compounds as gallium arsenide. Used in light-emitting diodes, batteries, and microwave equipment.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides such as lyes, halogens, and alloys of aluminum. Contact with hydrogen chloride/hydrochloric acid or hydrogen peroxide may result in explosion. Corrosive on contact with metals. Moisture, oxygen, and air sensitive.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 2000 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, and skin and/or eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Gallium can affect you when breathed in. Gallium is a corrosive chemical and exposure can irritate or burn the eyes, nose, and throat. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Repeated or high exposures can cause metallic taste; nausea, vomiting, skin rash, and may damage the kidneys.

Long-Term Exposure: May cause kidney damage. Some gallium compounds affect the nervous system. Highly irritating substances, such as gallium, may affect the lungs.

Points of Attack: Kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids. *Skin Contact:* Remove contaminated clothing. Wash contaminated skin with water. *Breathing:* Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If swallowed, do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to solid gallium, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. Where there is potential for exposure to liquid gallium or high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in the pressure-demand or other positive pressure mode.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location; in tightly closed original containers in a cool, well-ventilated area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Gallium must be stored to avoid contact with acids and halogens, since violent reactions occur.

Shipping: UN2803 Gallium, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous metal oxides are released in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water [Sigma-Aldrich MSDS].

Description: Gallium trichloride is a colorless solid which forms needle-like crystals. Acidic odor. Molecular weight = 176.081; specific gravity (H_2O:1) = 2.5 @ 26°C; boiling point = 201°C; freezing/melting point = 78°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1 ₩. Extremely soluble in water. Moisture sensitive; reaction with water may be violent.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, active metals, and water. Aqueous solution is acidic.

Potential Exposure: Used as a raw material in the production of metallic gallium; and in the processing of monocrystal, semiconductor compounds.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.9 milligram per cubic meter

PAC-2: 32 milligram per cubic meter

PAC-3: 930 milligram per cubic meter

Routes of Entry: Inhalation, skin, and eyes.

Harmful Effects and Symptoms

Short-Term Exposure: May act on skin or mucous membranes. May cause rash and neuritis. Can cause respiratory center paralysis and death in animals.

Points of Attack: Skin, liver, and respiratory organs.

Medical Surveillance: In view of the toxicity of gallium and its compounds, as shown by experiments, all persons involved in work with these substances should undergo periodic medical examinations, during which special attention should be paid to the condition of the liver, respiratory organs, and skin[136].

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area.

Shipping: UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN1759 Corrosive solids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous and corrosive fumes of chlorine and hydrogen chloride are released in fire. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 232-349-1 [*Annex I Index No.:* 649-261-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1989; NIOSH: Potential occupational carcinogen

California Proposition 65 Chemical[102]: Cancer [Unleaded gasoline (wholly vaporized)] 1/1/1988; [Gasoline engine exhaust (condensates/extracts)] 10/1/1990.

Hazard Alert: Highly flammable, Possible risk of forming tumors, Primary irritant (w/o allergic reaction).

European/International Regulations (*8006-61-9*): Hazard symbol: F, Xi; risk phrases: R11; R36; R657; safety phrases: S2; S7; S16; S21; S24/25; S26; S41; (*86290-81-5*): Hazard symbols, risk, & safety statements: Hazard symbol: T, F+; risk phrases: R12; R45; R46; R65; safety phrases: S21; S53; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (CAS: 86290-81-5)

Description: Gasoline is a highly flammable, mobile liquid with a characteristic odor. A complex mixture of volatile hydrocarbons (paraffins, cycloparaffins, and aromatics). Physical property values may vary depending on grade. The Odor Threshold is 0.25 ppm[41]. Molecular weight = 72; specific gravity (H_2O:1) = 0.72−0.76 @ 16°C; boiling point = 38°C; freezing/melting point = −90.5°C; flash point = −45°C to −38 (depending on octane). Explosive limits: LEL = 1.4%; UE = 7.6%. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 3−4, Reactivity 0. Insoluble in water.

Potential Exposure: Gasoline is used as a fuel, diluent, and solvent throughout industry.

Incompatibilities: May form explosive mixture with air. Strong oxidizers may cause fire and explosions. Incompatible with nitric acid. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.5 milligram per cubic meter (approx) @ 25°C & 1 atm

Odor Threshold = 0.25 ppm[41]

Presently, the composition of gasoline is so varied that a single standard for all types of gasoline is not applicable[3]. It is recommended, however, that atmospheric concentrations should be limited by the aromatic hydrocarbon content.

OSHA PEL: None

NIOSH REL: Potential occupational carcinogen; See *NIOSH Pocket Guide*, Appendix A; [15 ppm LOQ (* The analytical limit of quantitation)], DHHS #92-100, 1992

ACGIH TLV[1]: 300 ppm/890 milligram per cubic meter TWA; 500 ppm/1480 milligram per cubic meter STEL; confirmed animal carcinogen with unknown relevance to humans, See *NIOSH Pocket Guide*, Appendix A.

PAC* Ver. 29[138]

86290-81-5

PAC-1: $\mathbf{200_E}$ ppm

PAC-2: $\mathbf{1000_E}$ ppm

PAC-3: $\mathbf{4000_E}$ ppm

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

Japan; 100 ppm (300 milligram per cubic meter), 1999; Sweden: NGV 200 ppm (800 milligram per cubic meter), KTV 300 ppm (1200 milligram per cubic meter), 1993; Switzerland: MAK week 500 ppm (2000 milligram per cubic meter), 1999; Turkey: TWA 500 ppm (2000 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: STEL 500 ppm

Several states have set guidelines or standards for gasoline in ambient air[60] ranging from 15.0 milligram per cubic meter (Virginia) to 18.0 milligram per cubic meter (Connecticut) to 21.429 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #PV2820.

Permissible Concentration in Water: States which have set guidelines for gasoline in drinking water include Rhode Island (zero concentration) and Maine (100 μg/L).

Routes of Entry: Inhalation, percutaneous absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause eye and skin irritation. Inhalation can cause irritation of the respiratory tract. High levels can cause headache, nausea, dizziness, irregular heartbeat; loss of coordination; seizures, coma, and possible death. *Inhalation:* Nose and throat irritation have been reported after exposure to 900 ppm for 1 hour. Drowsiness, dizziness, nausea, and numbness may occur @ 1000 ppm after 15 minutes exposure. In animal studies, death occurred after 30,000 ppm for 5 minutes. *Skin:* May cause itching and burning of the skin and after a longer exposure, redness and blistering. *Eyes:* Moderate irritation of the eye has been reported after 1 hour exposure to 500 ppm. Mild irritation has been reported after an 8 hours exposure to 140 ppm. *Ingestion:* Gasoline causes a burning sensation in the mouth, throat, and stomach. Vomiting, diarrhea, drowsiness, and intoxication may follow. As little as 3−4 ounces may be fatal. Inhalation of liquid gasoline into the lungs following ingestion or vomiting may result in pulmonary edema (an accumulation of fluid in the lungs and a medical emergency that can be delayed for several hours), rapid breathing, or death.

Long-Term Exposure: There is evidence that gasoline can cause kidney cancer in animals. Repeated exposure can cause permanent eye damage. Prolonged contact can cause drying of the skin with cracking and rash. Repeated high exposure may damage the lungs; and/or cause brain damage. May cause kidney damage. Gasolines often contain hexane, benzene, and lead. Hexane, a component of gasoline, can produce disturbed sleep; resulting in tremors, numbness of hands and feet, and loss of muscle control. Benzene, has been linked to blood disorders in humans, including leukemia. Lead additives can produce nausea, cramps, loss of appetite, sleep problems, headaches, and agitation. See also entries for *tetraethyl lead, benzene, hexane, and ethylene dibromide*.

Points of Attack: Kidneys, skin, eyes, nervous system, and brain. Cancer site in animals: liver and kidney.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: urinary lead level. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If swallowed, use gastric lavage (stomach wash) followed by saline catharsis. Get medical attention. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Barrier creams and impervious gloves. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: nitrile rubber gloves, suits, boots; Viton gloves, suits; Barricade coated suits; **4 hours**: polyvinyl alcohol gloves; 4 H and Silver Shield gloves; Responder suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash, protective clothing, and masks in heavy exposure to vapors.

Respirator Selection: Where there is potential exists for exposure over 300 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator with an organic vapor cartridge/canister. More protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Sources of ignition, such as smoking and open flames are prohibited where gasoline is handled, used, or stored. Metal containers involving the transfer of 1 gallons or more of gasoline should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of gasoline. Wherever gasoline is used, handled, manufactured, or stared, use explosion-proof electrical equipment and fittings.

Shipping: UN1203 Gasoline includes gasoline mixed with ethyl alcohol, with not >10% alcohol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Alternatively, gasoline vapors may be recovered from fuel transfer operations by various techniques.

Germanium G:0110

Formula: Ge

Synonyms: Elemental germanium; Germanium element

CAS Registry Number: 7440-56-4

HSDB Number: 2118

RTECS Number: LY5200000 (powder)

UN/NA & ERG Number: UN3089 (metal powder, flammable, n.o.s.)/170; UN1759 (corrosive solid, n.o.s.)/154

EC Number: 231-164-3

Regulatory Authority and Advisory Information

Listed in on the TSCA inventory

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R36/37/38; safety phrases: S2; S16; S26; S36/37/39; S41 (see Appendix 4)

Description: Germanium is a grayish-white, lustrous, and brittle metalloid. The powder is grayish-black and odorless. It is never found free and occurs most commonly in ergyrodite and germanite. It is generally recovered as a by-product in zinc production, coal processing, or other sources. Molecular weight = 72.59; specific gravity (H_2O:1) = 5.4 g/cm^3; boiling point = 2833°C; melting/freezing point = 937°C; vapor pressure = 0 mmHg @ 25°C. Insoluble in water.

Potential Exposure: Because of its semiconductor properties, germanium is widely used in the electronic industry in rectifiers, diodes, and transistors. It is alloyed with aluminum, aluminum–magnesium, antimony, bronze, and tin to increase strength, hardness, or corrosion resistance. In the process of alloying germanium and arsenic, arsine may be released; stibine is released from the alloying of germanium and antimony. Germanium is also used in the manufacture of optical glass for infrared applications; red-fluorescing phosphors; and cathodes for electronic valves; and in electroplating; in the hydrogenation of coal; and as a catalyst, particularly at low temperatures. Certain compounds are used medically. Industrial exposures to the dust and fumes of the metal or oxide generally occur during separation and purification of germanium, welding, multiple-zone melting operations, or cutting and grinding of crystals. Germanium tetrahydride (germanium hydride, germane, and monogermane) and other hydrides are produced by the action of a reducing acid on a germanium alloy.

Incompatibilities: A strong reducing agent and flammable solid. Finely divided metal is incompatible with oxidizing and nonoxidizing acids, ammonia, bromine, oxidizers, aqua regia, sulfuric acid, carbonates, halogens, and nitrates. Explosive reaction or ignition with potassium chlorate, potassium nitrate, chlorine, bromine, oxygen, and potassium hydroxide in the presence of heat. Violent reaction with strong acids: aqua regia, nitric, and sulfuric. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 3.2 milligram per cubic meter

PAC-2: 35 milligram per cubic meter

PAC-3: 170 milligram per cubic meter

Russia[43] set a MAC in work-place air of 2 milligram per cubic meter.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 8 μg/L based on health effects.

Determination in Water: Germanium may be determined by atomic absorption spectroscopy, emission spectrography, and spectrophotometry with phenylfluorone.

Routes of Entry: Inhalation of gas, vapor, fume, or dust.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of germanium exposure[24] include low temperature, languor, diarrhea, cyanosis, extreme depression of heart and breath, edema, lung hemorrhage, hemorrhage from the small intestinal wall, and peritoneal extravasation. The dust of germanium dioxide is irritating to the eyes. Germanium tetrachloride causes irritation of the skin. Germanium tetrachloride is an upper respiratory irritant and may cause bronchitis and pneumonitis.

Long-Term Exposure: Prolonged exposure to high level concentrations may result in damage to the liver, kidney, and other organs.

Medical Surveillance: Consider respiratory, liver, and kidney disease in any placement or periodic examinations.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way* *valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: (1) Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well ventilated area separated from strong oxidants, strong bases and strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN1759 Corrosive solids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include metal oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water.* If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and return to suppliers for reprocessing is preferable.

EC Number: 231-961-6

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 45 (≥20.73% concentration)

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Pyrophoric hazard, Highly poisonous gas with inadequate warning properties, Strong reducing agent, Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Hemolytic effects.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F+, Xn; risk phrases: R5; R12; R17, R21; R22; R26; R40; R48/20; safety phrases: S1; S9; S16; S24; S26; S33; S36/37/39; S38; S41; S45 (see Appendix 4)

Description: Germane is a colorless, flammable gas. Pungent odor. Molecular weight = 76.63; specific gravity (H_2O:1) = 1.52 @ −142°C; boiling point = −88.3°C; freezing/melting point = −166°C; relative vapor density (air = 1) = 2.65; vapor pressure = > 1 atm @ 25°C; autoignition temperature = < 85°C. Flammable limits in air: pyrophoric. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 3. Insoluble in water.

Potential Exposure: This material is used as a doping agent in solid state electronic component manufacture.

Incompatibilities: Pyrophoric; may ignite spontaneously in air. Attacks hydrocarbon and fluorocarbon lubricants. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from oxidizing and nonoxidizing acids, ammonia, aqua regia, sulfuric acid, carbonates, halogens, and nitrates. Explosive reaction or ignition with potassium chlorate, potassium nitrate, chlorine, bromine, oxygen, and potassium hydroxide in the presence of heat.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.13 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 0.2 ppm/0.6 milligram per cubic meter TWA
ACGIH TLV[1]: 0.2 ppm
PAC* Ver. 29[138]
PAC-1: 0.015 ppm
PAC-2: **0.17**$_{\mathbf{A}}$ ppm
PAC-3: **0.50**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values. Australia: TWA 0.2 ppm (0.6 milligram per cubic meter), 1993; Belgium: TWA 0.2 ppm (0.63 milligram per cubic meter), 1993; Denmark: TWA 0.2 ppm (0.6 milligram per cubic meter), 1999; Finland: STEL 0.2 ppm (0.6 milligram per cubic meter), 1999; France: VME 0.2 ppm (0.6 milligram per cubic meter), 1999; Norway: TWA 0.2 ppm (0.6 milligram per cubic meter), 1999; Russia: STEL 5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 0.6 milligram per cubic meter, 2003; United Kingdom: TWA 0.2 ppm (0.64 milligram per cubic meter); STEL 0.6 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 0.2 ppm. Several states have set guidelines or standards for germane in ambient air[60] ranging from 6.0 μ/m^3 (North Dakota) to 10.0 μ/m^3 (Virginia) to 12.0 μ/m^3 (Connecticut) to 14.0 μ/m^3 (Nevada).

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation can cause headache, giddiness, fainting, nausea, and vomiting. Data on toxicity are limited but ACGIH reports that it is between ten hydride (stannone) and arcine in toxicity. Germanium tetrahydride is a toxic hemolytic gas capable of production kidney damage. This effect is similar to that of arsine and stibine (antimony hydride). One hour exposure tests on animals yielded the following results: animal rabbit, concentration 100 ppm, effect survived; animal mouse, concentration 150 ppm, effect fatal; animal mouse, concentration 185 ppm, effect fatal; animal guinea pig, concentration 150 ppm, effect sickened; and animal guinea pig, concentration 185 ppm, effect fatal. The TWA value was set on the rather arbitrary basis that germane can be considered half as toxic as stibine[53].

Long-Term Exposure: May cause kidney injury. Hemolytic effects, affecting blood cells.

Points of Attack: Central nervous system kidneys, and blood.

Medical Surveillance: Workers exposed to germane should undergo periodic physical examinations[30]. Kidney function tests. Complete blood count (CBC). Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and

face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool (below 50°C), well ventilated area away from bromine. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2192 Germane, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone B. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 500/150

Then: Protect persons downwind (mi/km)

Day 0.5/0.8

Night 2.0/3.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 2500/800

Then: Protect persons downwind (mi/km)

Day 2.7/4.4

Night 6.6/10.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Dangerous gases may be released in fire including flammable hydrogen and oxides of metal. This gas is under pressure; containers may rupture and explode when heated. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed.

RTECS Number: MA2450000

UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: 203-856-5 [*Annex I Index No.*: 605-022-00-X]

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); no evidence: mouse, rat. United States Environmental Protection Agency Gene-Tox Program, Negative: CHO gene mutation.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Sensitization hazard (skin, resp.), Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xi; risk phrases: R23/25; R34; R42/43; R50; R62; R63; safety phrases: S1/2; S26; S29/35; S36/37/39; S45; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Glutaraldehyde is a colorless liquid with a pungent odor, which readily changes to a glossy polymer. The Odor Threshold is 0.04 ppm (NY) and 0.2 ppm (NJ). Molecular weight = 100.13; specific gravity (H_2O:1) = 1.10; boiling point = 100°C; also reported @ 187−189°C (decomposes); freezing/melting point = −13.8°C; vapor pressure = 17 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Glutaraldehyde is used in leather tanning; in embalming fluids; as a germicide; as a cross-linking agent for protein and polyhydroxy materials; as a fixative for tissues; and as an intermediate. Buffered solutions are used as antimicrobial agents in hospitals.

Incompatibilities: Water contact forms a polymer solution. A strong reducing agent. Incompatible with strong acids; caustics, ammonia, amines, and strong oxidizers. *Note:* Alkaline solutions of glutaraldehyde (i.e., activated glutaraldehyde) react with alcohol, ketones, amines, hydrazines, and proteins.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.09 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.2 ppm/0.8 milligram per cubic meter Ceiling Concentration. *Note:* NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112]; See *NIOSH Pocket Guide*, Appendix C

ACGIH TLV[1]: 0.05 ppm/0.2 milligram per cubic meter Ceiling Concentration, sensitizer, not classifiable as a human carcinogen.

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.2_A}$ ppm

PAC-2: $\mathbf{1_A}$ ppm

PAC-3: $\mathbf{5_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.05 ppm/0.21 milligram per cubic meter TWA; Peak Limitation Category I(2) a momentary value of 0.2 ml/m^3/0.83 milligram per cubic meter should not be exceeded; danger of skin and airway sensitization; Carcinogen Category 4; Pregnancy Risk Group C

Australia: TWA 0.2 ppm (0.7 milligram per cubic meter), 1993; Austria: MAK 0.2 ppm (0.8 milligram per cubic meter), 1999; Belgium: TWA 0.2 milligram per cubic meter; STEL 0.82 milligram per cubic meter, 1993; Denmark: TWA 0.2 ppm (0.8 milligram per cubic meter), 1999; Finland: ceiling 0.1 ppm, 1999; France: VLE 0.2 ppm (0.8 milligram per cubic meter), 1999; Norway: TWA 0.2 ppm (0.8 milligram per cubic meter), 1999; the Netherlands: MAC 0.25 milligram per cubic meter, 2003; Russia: STEL 5 milligram per cubic meter, 1993; Sweden: STEL 0.2 ppm (0.8 milligram per cubic meter), [skin], 1999; Switzerland: MAK-W 0.2 ppm (0.8 milligram per cubic meter), KZG-W 0.4 ppm (1.6 milligram per cubic meter), 1999; United Kingdom: TWA 0.05 ppm (0.2 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: Ceiling Concentration 0.05 ppm (senitizer). Several states have set guidelines or standards for glutaraldehyde in ambient air[60] ranging from 6.0 μ/m^3 (Virginia) to 7.0 μ/m^3 (North Dakota) to 14.0 μ/m^3 (Connecticut) to 17.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2532 or OSHA Analytical Method 64.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -0.22$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* 0.3 ppm can cause nose and throat irritation. 0.4 ppm has caused headaches. 0.5 ppm has been described as intolerably irritating. *Skin:* Can cause irritation. Contact with a 5% solution can sensitize the skin and cause an allergic response to subsequent contact of much lower concentrations. *Eyes:* Vapors of a 2% solution (0.4 ppm) have produced irritation. *Ingestion:* Can cause irritation of the mouth and stomach. The LD_{50} oral rat is 134 mg/kg (moderately toxic).

Long-Term Exposure: Repeated or prolonged contact with skin may cause chemical sensitization, skin allergy, and asthma. Exposure may cause liver and nervous system damage. Glutaraldehyde may cause mutations, handle with extreme caution. Testing has not been completed to determine the carcinogenicity of glutaraldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Eyes, skin, respiratory system, liver, and nervous system.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: butyl rubber gloves, suits, and boots; Viton gloves and suits; **4 hours**: natural rubber gloves; Neoprene rubber gloves, suits, and boots; nitrile rubber gloves, suits, and boots; polyvinyl chloride gloves, suits, and boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over* 0.2 ppm; Use an NIOSH/MSHA or European Standard EN 149-approved respirator with an organic vapor cartridge/canister and a dust/mist/fume prefilter. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from strong acids, caustics, ammonia, amines, and oxidizers.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Glutaraldehyde itself does not burn. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Glycerin G:0150

Formula: $C_3H_8O_3$; $HOCH_2CHOHCH_2OH$

Synonyms: 90 Technical glycerin; Glycerin, anhydrous; Glycerin, synthetic; Glyceritol; Glycerol; Glycyl alcohol; Grocolene; Moon; 1,2,3-Propanetriol; Synthetic glycerin; 1,2,3-Trihydroxypropane; Trihydroxypropane

CAS Registry Number: 56-81-5

HSDB Number: 492

RTECS Number: MA8050000

UN/NA & ERG Number: UN1760 (corrosive liquids, n.o.s.)/154[101]

EC Number: 200-289-5

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

FDA-over the counter and proprietary drug

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R62; R63;?; safety phrases: (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Glycerol is a viscous colorless or pale yellow, odorless, syrupy liquid. Molecular weight = 92.09; specific gravity (H_2O:1) = 1.26 @ 20°C; boiling point = (decomposes) 290°C; freezing/melting point = 18.1°C; vapor pressure = 0.003 mmHg @ 50°C; flash point = 160°C; also listed @ 177°C (oc). autoignition temperature = 370°C. Explosive limits: LEL = 0.9%; UEL: Unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Glycerol is used as a humectant in tobacco; it is used in cosmetics, antifreezes and inks. It is used as a fiber lubricant. It is used as a raw material for alkyd resins and in explosives manufacture.

Incompatibilities: Able to polymerize above 300°F/150°C. Incompatible with acetic anhydrides (especially in the presence of a catalyst), strong acids, caustics, aliphatic amines, and isocyanates. Strong oxidizers, e.g., chromium trioxide, potassium chlorate, and potassium permanganate); can cause fire and explosion hazard. Hygroscopic (i.e., absorbs moisture from the air). Decomposes when heated, producing corrosive gas of acrolein.

Permissible Exposure Limits in Air

OSHA PEL: 15 milligram per cubic meter (total dust); 5 milligram per cubic meter, respirable fraction, TWA

NIOSH REL: None, see Appendix D

ACGIH TLV[1]: 10 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 45 milligram per cubic meter

PAC-2: 180 milligram per cubic meter

PAC-3: 1100 milligram per cubic meter

DFG MAK: 50 milligram per cubic meter, inhalable faction of the aerosol; Peak Limitation Category I(2); Pregnancy Risk Group C

Australia: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Finland: TWA 20 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter, 1999; United Kingdom: TWA 10 milligram per cubic meter, mist, 2000; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 10 milligram per cubic meter. Several states have set guidelines or standards for glycerol in ambient air[60] ranging from 3.0 μ/m^3 (Virginia) to 200.0 μ/m^3 (Florida and New York) to 238.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #0500 for total nuisance dust and #0600 for respirable nuisance dust.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = -1.8$. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Glycerin can be irritating to the eyes, skin, and respiratory tract. When swallowed, it can cause insomnia, nausea, vomiting, diarrhea, fever, hemoglobinuria, convulsions, and paralysis. Toxic in high concentrations; it is somewhat dehydrating and irritating to exposed tissues. Symptoms include headache, dizziness, insomnia, nausea, vomiting, diarrhea, fever, elevated blood sugar, and diabetic coma; very large doses may cause irritation and dehydration of tissues, hemolysis, renal failure, hemoglobinuria, convulsions, and paralysis.

Long-Term Exposure: May cause kidney damage.

Points of Attack: Eyes, skin, respiratory system, and kidneys.

Medical Surveillance: Kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: Prevent skin contact. **8 hours**: natural rubber gloves, Neoprene rubber gloves, suits, and boots; nitrile rubber gloves, suits, and boots; **4 hours**: 4 H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.

Storage: Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1760 Corrosive liquids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide, water fog, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mixture with a more flammable solvent followed by incineration.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Glycidol is a colorless liquid. Molecular weight = 74.09; specific gravity (H_2O:1) = 1.1 @ 20°C; boiling point = (decomposes) 166°C; freezing/melting point = −45°C; vapor pressure = 0.9 mmHg @ 25°C; flash point = 72°C (cc); autoignition temperature = 415°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Glycidol is used as an intermediate in the synthesis of glycerol, glycidyl ethers, esters, and amines.

Incompatibilities: May form explosive mixture with air. Violent reaction with strong oxidizers, nitrates. Decomposes on contact (especially in the presence of heat) with strong acids, strong bases, water, metal salts, e.g., aluminum chloride, ferric chloride, and tin chloride), or metals (copper and zinc), causing fire and explosion hazard. Contact with barium, lithium, sodium, magnesium, and titanium may cause polymerization. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 150 ppm

Conversion factor: 1 ppm = 3.03 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 50 ppm/150 milligram per cubic meter TWA

STEL 5 milligram per cubic meter, 1993; Sweden: NGV 25 ppm (75 milligram per cubic meter), KTV 50 ppm (150 milligram per cubic meter), 1999; Switzerland: MAK-W 25 ppm (75 milligram per cubic meter), KZG-W 50 ppm (150 milligram per cubic meter), 1999; Turkey: TWA 50 ppm (150 milligram per cubic meter), 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for glycidol in ambient air[6] ranging from 750 to 3000 μ/m^3 (North Dakota) to 1300 μ/m^3 (Virginia) to 1500 μ/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #1608[18] or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion and skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Glycidol affects you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Vapor exposure can damage vision. Exposure can irritate the eyes, nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High levels can cause you to feel dizzy, lightheaded, confused, excited, to pass out, and even die. May affect the central nervous system.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. It can irritate the lungs; bronchitis may develop. May cause personality changes, depression, anxiety, or irritability. Possibly carcinogenic to humans. Because this is a potential mutagen, handle it as a possible carcinogen, with extreme caution. May cause sterility in males. Based on animal tests, this substance may have toxic effects on human reproduction.

Points of Attack: Eyes, skin, respiratory system, and central nervous system. Cancer site in animals: stomach, brain, and breast.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure. Exam of the eyes and vision.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: up to 150 ppm: Sa (APF = 10) (any supplied-air respirator); * or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Glycidol must be stored to avoid contact with strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Store in tightly closed containers in a cool, well-ventilated area away from heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive- pressure mode.

Disposal Method Suggested: *Concentrated waste containing no peroxides:* discharge liquid at a controlled rate near a pilot flame. *Concentrated waste containing peroxides:* perforation of a container of the waste from a safe distance followed by open burning.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

California Proposition 65 Chemical[102]: Cancer 1/1/1988

Hazard Alert: Poison, Highly flammable, Poison, Polymerization hazard.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U126

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R2, R11; R19; R36/37/38; safety phrases: S9; S15; S16; S21; S33; S45 (see Appendix 4)

Description: Glycidyl aldehyde is a colorless liquid. It has a pungent, aldehyde-like odor. Molecular weight = 72.06; specific gravity (H_2O:1) = 1.14 @ 20°C; boiling point = 112.5°C; freezing/melting point = −62°C; flash point = 31°C. Hazard identification[70]: Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Glycidyldehyde is and epoxide used to synthesize other chemicals. It has been used in the finishing of wool and the tanning of leather and surgical sutures in the U.K. It has been tested as a disinfectant.

Incompatibilities: Glycidaldehyde may undergo violent polymerization when subjected to heat, strong sunlight, or contamination. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. When heated or in contact with catalysts, epoxides may cause violent polymerization. Epoxides are incompatible with reducing agents and oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. May react, possibly violently, with water in the presence of acid and other catalysts. Reacts with alcohols, amines, and other active hydrogen compounds. Slowly hydrolyzes in water.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.39 ppm

PAC-2: 4.3 ppm

PAC-3: 26 ppm

Permissible Exposure Limits in Air

Several states have set guidelines or standards for glycidylaldehyde in ambient air[60] ranging from zero (Nevada) to 0.03 μ/m^3 (New York) to 75.0 μ/m^3 (South Carolina).

Routes of Entry: Inhalation, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May be fatal if inhaled, ingested, or absorbed through the skin. Contact can cause severe skin and eye irritation and burns with possible permanent eye damage. Skin burns can be slow healing, followed by pigmentation. Inhalation can cause respiratory tract irritation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May be a carcinogen in humans. May cause skin sensitization and allergy. May cause liver and kidney damage. May affect the nervous system. Can cause lung irritation and bronchitis.

Points of Attack: Eyes, skin, liver, kidneys, nervous system, lungs, and mucous membranes.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests. Examination of the nervous system. Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. *Gloves:* Butyl, PVC, and Silver Shield/4 H, (4 hours breakthrough for aldehydes; *Coveralls:* DuPont Tychem BR, LV, Responder, and TK; Kappler Zytron 500; and Saint-Gobain ONE Suit TEC (>8 hours breakthrough for aliphatic aldehydes). Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color code-Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers, nitrates, heat, and flames. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2622 Glycidaldehyde, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials. The addition of antioxidant stabilizers to shipments of aldehydes may retard autoxidation.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Use water spray to reduce vapors. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray, fog, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive- pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Classification D, Not Classifiable as to human carcinogenicity. *Note*: The World Health Organization's (WHO) published its latest review of the cancer risks of glyphosate in March 2015. When high doses were administered to laboratory animals, some studies suggest that glyphosate has carcinogenic potential. Studies on cancer rates in people have provided conflicting results on whether the use of glyphosate containing products is associated with cancer. Some studies have associated glyphosate use with non-Hodgkin lymphoma[162].

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Safe Drinking water Act, United States National Primary Drinking Water Regulations: MCLG = 0.7 mg/L; MCL = 0.7 mg/L.

NTP: Toxicity studies, Report #TOX-16, October 2000

DOT Inhalation Hazard Chemicals as organophosphates

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, N; risk phrases: R40; R41; R51/53; R62; R63; safety phrases: S2; S26; S39; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Glyphosate, an organophosphate/carboxylic acid (substituted), is a colorless crystalline powder. Often used as a liquid in a carrier solvent which may change physical and toxicological properties. Molecular weight = 169.09; freezing/melting point = (decomposes) 230°C. Soluble in water; solubility = 1.2% @ 25°C.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this nonselective and nonresidual pre-emergence organophosphate herbicide. Has wide residential use in the United States for the control of weeds.

Incompatibilities: Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrides. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101]. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water, and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates, and dithionites (releasing hydrogen sulfate and oxides of sulfur). Solutions are corrosive to iron, unlined steel, and galvanized steel, forming a highly combustible or explosive gas mixture. *Do not* store glyphosate in containers made from these materials.

Permissible Exposure Limits in Air: No OELs have been established in the United States for this chemical. Russia has set a ceiling value in work-place air of 1.5 milligram per cubic meter[35],[43].

Permissible Concentration in Water: Safe Drinking Water Act United States National Primary Drinking Water Regulations: MCLG = 0.7 mg/L; MCL = 0.7 mg/L. The United States Environmental Protection Agency has developed data on Glyphosate including a no-observed-adverse-effects-level (NOAEL) of 10 mg/kg/day. This corresponds to a drinking water equivalent level of 3.5 mg/L from which a lifetime health advisory of 0.7 mg/L was derived. California[61] has set a guideline of 0.5 mg/L for drinking water.

Determination in Water: Analysis of glyphosate is by a high-performance liquid chromatographic (HPLC) method. Octanol-water coefficient: Log $K_{ow} = -0.9$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, and through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure to high levels can cause nausea, vomiting, diarrhea, decreased blood pressure, and convulsions. High exposures can cause arrhythmia and possible death. LD_{50} (oral, rat) = 5600 mg/kg (insignificantly toxic). Human Tox = 700.00000 ppb (Very Low).

Long-Term Exposure: Glyphosate is reported by United States Environmental Protection Agency to cause kidney problems and reproductive difficulties.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase, liver, kidney, and heart.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Employees shall be counseled by the physician to ensure that employee is aware that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be indicated. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Liver and kidney function tests. Special 24-hour EKG (Holter monitor) for irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area away from oxidizers.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Solid glyphosate may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and phosphorus. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information.

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Graphite is crystallized carbon and usually appears as soft, black scales. There are two types of graphite, natural and artificial (activated). Natural and synthetic graphite may be mixed with each other or contain other additives. Molecular weight = 12.01 (natural and synthetic);

specific gravity (H_2O:1) = 2.0−2.25 (natural); 1.8−3.53 (synthetic); boiling point = 3682°C (synthetic); vapor pressure = 1 mmHg @ 3586°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Natural graphite is used in foundry facings, steel making lubricants, refractories, crucibles, pencil "lead," paints, pigments, and stove polish. Artificial graphite may be substituted for these uses with the exception of clay crucibles; other types of crucibles may be produced from artificial graphite. Additionally, it may be used as a high temperature lubricant or for electrodes. It is utilized in the electrical industry in electrodes, brushes, contacts, and electronic tube rectifier elements; as a constituent in lubricating oils and greases; to treat friction elements, such as brake linings; to prevent molds from sticking together; and in moderators in nuclear reactors. In addition, concerns have been expressed about synthetic graphite in fibrous form. Those exposed are involved in production of graphite fibers from pitch or acrylonitrile fibers and the manufacture and use of composites of plastics, metals, or ceramics reinforced with graphite fibers.

Incompatibilities: Graphite is a strong reducing agent and reacts violently with oxidizers, such as fluorine, chlorine trifluoride, and potassium peroxide. Forms an explosive mixture with air. May be spontaneously combustible in air.

Permissible Exposure Limits in Air

graphite, natural

OSHA PEL: 15 mppcf, respirable fraction (based on impinger samples counted by light field techniques)TWA

NIOSH REL: 2.5 milligram per cubic meter, respirable dust TWA

ACGIH TLV[1]: (all forms except graphic fibers) 2 milligram per cubic meter, respirable fraction TWA

graphite, synthetic

NIOSH IDLH = 1250 milligram per cubic meter

OSHA PEL: 15 ppm total dust/5 milligram per cubic meter, respirable fraction TWA

ACGIH TLV[1]: (all forms except graphic fibers) 2 milligram per cubic meter, respirable fraction TWA

PAC Ver. 29[138]

7782-42-5, natural mineral carbon & 7440-44-0, synthetic

PAC-1: 6 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

DFG MAK: 1.5 milligram per cubic meter, respirable fraction; 4 milligram per cubic meter, inhalable fraction; Pregnancy Risk Group C

Australia: TWA 10 milligram per cubic meter, 1993; Australia: TWA 2.5 milligram per cubic meter, 1993; Belgium: TWA 10 milligram per cubic meter, 1993; Belgium: TWA 2.5 milligram per cubic meter, 1993; Finland: TWA 5 milligram per cubic meter, 1999; France: VME 2 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; Sweden: NGV 5 milligram per cubic meter (*dust*), 1999; Switzerland: MAK-W 2.5 milligram per cubic meter, 1999; United Kingdom: LTEL 5 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV[1]: TWA 2 milligram per cubic meter, respirable fraction.

Determination in Air: Use NIOSH Analytical Methods #0500 or #0600.

Routes of Entry: Inhalation of dust, eye, and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Causes upper respiratory irritation.

Long-Term Exposure: Lungs may be affected by repeated or prolonged exposure to dusts, resulting in graphite pneumoconiosis. Exposure to natural graphite may produce a progressive and disabling pneumoconiosis similar to anthracosilicosis. Symptoms include headache, coughing, depression, decreased appetite, dyspnea, and the production of black sputum. Some individuals may be asymptomatic for many years then suddenly become disabled. It has not yet been determined whether the free crystalline silica in graphite is solely responsible for development of the disease. There is evidence that artificial graphite may be capable of producing a pneumoconiosis.

Points of Attack: Respiratory system, lungs, and cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, expired air, pulmonary function tests: forced vital capacity and forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash

Respirator Selection: NIOSH: (natural) up to 12.5 milligram per cubic meter: Qm (APF = 25) (any quarter-mask respirator). 25 milligram per cubic meter: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]. 62.5 milligram per cubic meter: PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). 125 milligram per cubic meter: 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece). 1250 milligram per cubic meter: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code-Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1 hour fire wall from flammable or reactive materials. Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well ventilated area

Shipping: UN1362 Carbon, activated, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material, International.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not incinerate. Carbon (graphite) fibers are difficult to dispose of by incineration. Waste fibers should be packaged and disposed of in a landfill authorized for the disposal of special wastes of this nature, or as otherwise may be required by law.

H

Hafnium and Compounds H:0100

Formula: Hf
Synonyms: Celtium; Elemental hafnium; Hafnium metal
CAS Registry Number: 7440-58-6 (metal); 12055-23-1 (oxide)
HSDB Number: 552
RTECS Number: MG4600000
UN/NA & ERG Number: UN2545 (hafnium powder, dry)/135; UN1326 (hafnium powder, wet with not <25% water)/170; UN1346 (Hafnium powder, wetted with not less than 25% water)/170
EC Number: 231-166-4

Regulatory Authority and Advisory Information

Hazard Alert: Flammable solid, Pyrophoric (dry dust/powder), Strong reducing agent.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R17; R20/21/22; safety phrases: S9; S16; S26; S33; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water (particles >1 mm).

Description: Hafnium is a refractory metal which occurs in nature in zirconium minerals. Molecular weight = 178.49; specific gravity (H_2O:1) = 13.3; boiling point = 4603°C; freezing/melting point = 2233°C ₩. Practically insoluble in water. Dry powder reacts with moisture forming flammable hydrogen gas and heat that might ignite H_2. *Hafnium oxide*: Molecular weight = 210.49; specific gravity (H_2O:1) = 9.68; boiling point = 5400°C; freezing/melting point = 2812°C. Insoluble in water.

Potential Exposure: Hafnium metal has been used as a control rod material in nuclear reactors. Thus, those engaged in fabrication and machining of such rods may be exposed.

Incompatibilities: Fine powder or dust may form explosive mixture in air. The powder is highly flammable and a strong reducing agent. The powder or dust reacts with moisture forming flammable hydrogen gas; may spontaneously ignite on contact with moist air; and at higher temperatures, with nitrogen, phosphorous, oxygen, halogens, and sulfur; contact with hot nitric acid; heat, shock, friction, strong oxidizers; or ignition sources may cause explosions.

Permissible Exposure Limits in Air

Note: also applies to other hafnium compounds, as [Hf]
NIOSH IDLH = 50 mg [Hf]/m^3
OSHA PEL: 0.5 mg[Hf]/m^3 TWA
NIOSH REL: 0.5 mg[Hf]/m^3 TWA
ACGIH TLV[1]: 0.5 mg[Hf]/m^3 TWA
Protective Action Criteria (PAC) Ver. 29[138]
7440-58-6, metal
PAC-1: 1.5 milligram per cubic meter
PAC-2: 17 milligram per cubic meter
PAC-3: 99 milligram per cubic meter
Australia: TWA 0.5 milligram per cubic meter, 1993; Austria: MAK 0.5 milligram per cubic meter, 1999; Belgium: TWA 0.5 milligram per cubic meter, 1993; Denmark: TWA 0.5 milligram per cubic meter, 1999; Finland: TWA 0.5 milligram per cubic meter, 1999; France: VME 0.5 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter, 1999; Switzerland: MAK-W 0.5 milligram per cubic meter, 1999; United Kingdom: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 mg[Hf]/m^3. Several states have set guidelines or standards for hafnium in ambient air[60] ranging from 5.0 μ/m^3 (North Dakota) to 8.0 μ/m^3 (Virginia) to 10.0 μ/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).
PAC Ver. 29[138]
12055-23-1, oxide
PAC-1: 1.8 milligram per cubic meter
PAC-2: 19 milligram per cubic meter
PAC-3: 120 milligram per cubic meter

Determination in Air: Use NIOSH II(5), Method #S-194 or OSHA Analytical Method ID-121.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of eyes, skin and mucous membranes.

Long-Term Exposure: Lungs may be affected by repeated or prolonged exposure. May cause liver damage.

Points of Attack: Eyes, skin, lungs, liver, and mucous membranes.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00008-9

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 2.5 milligram per cubic meter*: Q_m (APF = 25) (any quarter-mask respirator). *Up to 5 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any powered, air-purifying respirator with a dust and mist filter); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 25 milligram per cubic meter*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100); or SaT:Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie* (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus (SCBA) with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 50 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SaF:Pd,Pp (APF = 2000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code—Yellow Stripe (*dry powder is a strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1326 Hafnium powder, wetted with not $<25\%$ water (a visible excess of water must be present) (1) mechanically produced, particle size $<53\,\mu m$; (2) chemically produced, particle size $<840\,\mu m$, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN2545 Hafnium powder, dry, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN1346 Hafnium powder, wetted with not less than 25% water (a visible excess of water must be present) (1) mechanically produced, particle size less than 53 μm; (2) chemically produced, particle size less than 840 μm, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency (EPA) for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of metal. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery. Consider recycling, otherwise, this chemical must be disposed of in compliance with existing federal and local regulations.

Halothane H:0110

Formula: $C_2HClBrF_3$; $CF_3CHBrCl$
Synonyms: Anestan; 2-Bromo-2-chloro-1,1,1-trifluoro-; 2-Bromo-2-chloro-1,1,1-trifluoroethane; Chalothane; Ethane, 2-bromo-2-chloro-1,1,1-thrifluoro-; Fluotane; Fluothane; Halotan; Halsan; Narcotane; 1,1,1-Trifluoro-2-bromo-2-chloroethane; 1,1,1-Trifluoro-2-chloro-2-bromoethane; 2,2,2-Trifluoro-1-chloro-1-bromoethane
CAS Registry Number: 151-67-7
HSDB Number: 6753 as 2-bromo-2-chloro-1,1,1-trifluoroethane
RTECS Number: KH6475000
UN/NA & ERG Number: UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171
EC Number: 205-796-5
Regulatory Authority and Advisory Information
Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3
Hazard Alert: Possible reproductive toxin, Asphyxiation hazard, Light sensitive (decomposition unless stabilized).
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, N; risk phrases: R10; R20, R37/38; R40, R41; R50; R61, R62; safety phrases: S23; S26; S36/37; S41; S45; S53 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Halothane is a highly volatile, nonflammable, colorless liquid. Sweet odor. Molecular weight = 197.39; specific gravity (H_2O:1) = 1.87; boiling point = 50°C; freezing/melting point = −118°C; relative vapor density (air = 1) = 2.9; vapor pressure = 243 mmHg. Practically insoluble in water; solubility = 0.5%.
Potential Exposure: Halothane is used as an inhalation anesthetic. It has been estimated that halothane accounts for two-thirds of all anesthetics.
Incompatibilities: May attack rubber and some plastics; sensitive to light. Light causes decomposition. May be stabilized with 0.01% thymol. Halothane is incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Tarnishes or corrodes most metals, with the exception of copper, chromium, nickel, and titanium[101]. Attacks aluminum, brass and lead in the presence of moisture. Attacks rubber and causes some plastics to deteriorate rapidly.
Permissible Exposure Limits in Air
Odor threshold = 33 ppm. OSHA PEL: None
NIOSH REL: 2 ppm/16.2 milligram per cubic meter [60-minute exposure to wasted anesthetic gas] Ceiling Concentration ACGIH TLV[1]: 50 ppm/404 milligram per cubic meter TWA; not classifiable as a human carcinogen
No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.
DFG MAK: 5 ppm/41 milligram per cubic meter TWA; Peak Limitation Category II(8); Pregnancy Risk Group B
Determination in Air: Use OSHA Analytical Method #29.
Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.
Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.30$. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact Passes through the skin.
Harmful Effects and Symptoms
Short-Term Exposure: Contact can irritate the eyes and skin. Inhalation can irritate the respiratory tract causing coughing and wheezing. May affect the cardiovascular system with low blood pressure and abnormal heartbeat; and central nervous system. High levels of exposure may cause dizziness, lightheadedness, nausea, vomiting, and very high levels can cause unconsciousness. Medical observation is indicated. *Inhalation:* Exposure to 4000 ppm can cause amnesia and impairment of manual dexterity. Exposure to 10,000 ppm can cause anesthesia. Liver impairment has occurred from use as an anesthetic. *Skin:* Repeated or prolonged application can destroy the skin. Halothane gives rise to only a very low incidence of postoperative nausea and is generally safe, which accounts for its wide-spread use.
Long-Term Exposure: May affect the liver and kidneys. Reported to have caused irregular menstrual period, headache, fatigue, and unconsciousness. Halothane has also been shown to cause birth defects in rats. May cause reproductive toxicity in humans. Experiments in laboratory animals have shown that continuous exposures of 15−50 ppm may cause liver damage.
Points of Attack: Liver, kidneys, skin, respiratory system; cardiovascular system; central nervous system. Based on animal tests, this may cause damage to the reproductive system.
Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. EKG. If symptoms develop or overexposure has occurred, repeat these tests. More than light alcohol consumption may exacerbate liver damage. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories

emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Prevent skin contact. **8 hours:** polyvinyl alcohol gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 2 ppm*; Use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure location. Prior to working with halothane, you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area, away from direct sunlight and oxidizers.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable liquid. Thermal decomposition products may include hydrogen chloride, hydrogen fluoride, hydrogen bromide, halogen acids, carbonyl halises and oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Helium H:0120

Formula: He

Synonyms: Helium, elemental

CAS Registry Number: 7440-59-7

HSDB Number: 553

RTECS Number: MH6520000

UN/NA & ERG Number: UN1046 (Helium, compressed)/121; UN1963 [Helium, refrigerated liquid (cryogenic liquid)]/120

EC Number: 231-168-5

Regulatory Authority and Advisory Information

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R5; R9; R21; safety phrases: S9; S33; R38; S41 (see Appendix 4)

Description: Helium is a colorless, odorless, and tasteless gas. It is nonflammable. Molecular weight = 4.0; specific gravity (H_2O:1) = 0.15 @ −271°C; boiling point = −269°C; freezing/melting point = −272°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: It is used in weather balloons and in welding gases. Liquid helium is used as a closed system cooling agent.

Permissible Exposure Limits in Air

ACGIH TLV[1]: simple asphyxiant PAC Ver. 29[138]

PAC-1: 65,000 ppm

PAC-2: 230,000 (2.30E + 05) ppm

PAC-3: 400,000 (4.00E + 05) ppm

No occupational exposure limits have been established for this substance. Large amounts of helium will, however, decrease the amount of available oxygen. Oxygen content should never be below 19%.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Helium can affect you when breathed in. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels can cause you to pass out and even die due to suffocation from lack of oxygen. Contact with liquid helium can cause frostbite.

First Aid: If frostbite has occurred, seek medical attention immediately; *do not* rub the affected areas or flush them with water. In order to prevent further tissue damage, *do not* attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention promptly. *Breathing:* Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: *Clothing:* Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn.

Respirator Selection: Exposure to helium gas is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in the positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Liquid helium should be stored and transferred under positive pressure to prevent infiltration of air and other gasses. Protect this material from exposure to light. Keep it away from oxidizing materials and store it under refrigerated temperatures. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1046 Helium, compressed, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas; UN1963 Helium, refrigerated liquid (cryogenic liquid), Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas.

Spill Handling: If liquid helium is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Stop the leak or move container to a safe area and allow the liquid to evaporate. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty.

Fire Extinguishing: Helium gas may burn but does not readily ignite. Stop flow of gas. Use extinguisher suitable for surrounding fire. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

Hematite H:0130

Formula: Fe_2O_3

Synonyms: Bloodstone; Hematite; Hematite, red; Iron ore; Iron oxide; Red iron ore

CAS Registry Number: 1317-60-8; 1309-37-1 (ferric oxide, Fe_2O_3)

HSDB Number: 2964

RTECS Number: MH7600000

EC Number: 215-168-2 (diiron trioxide; protohematite; CAS 1309-37-1)

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal No Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; (*underground mining with exposure to radon*) Human Sufficient Evidence (underground mining with exposure to radon), *carcinogenic to humans*, Group 1, 1998.

Hazard Alert: Possible risk of forming tumors, as Fe_2O_3.

WGK[100] (German Aquatic Hazard Class): Non hazard to water. (CAS: 1309-37-1)

Description: Hematite is a noncombustible, black to black-red or brick-red mineral (iron ore) composed mainly of ferric oxide, Fe_2O_3. *Ferric oxide:* Molecular weight: 159.69; specific gravity (H_2O:1) = 5.3 @ 20°C; freezing/melting point = 1539°C. See also *Iron oxide*

Potential Exposure: Hematite; as an iron ore composed mainly of ferric oxide, is a major source of iron and is used as a pigment for rubber, paints, paper, linoleum, ceramics, dental restoratives; and as a polishing agent for glass and precious metals. It is also used in electrical resistors, semiconductors, magnets, and as a catalyst. Human exposure to hematite from underground hematite mining is principally through inhalation and/or ingestion of dusts. No estimates are available concerning the number of underground miners exposed.

Incompatibilities: Contact with hydrogen peroxide, ethylene oxide, calcium hypochlorite will cause explosion. Violent reaction with powdered aluminum; hydrazine, hydrogen trisulfide.

Permissible Exposure Limits in Air

NIOSH IDLH = 2500 mg[Fe]/m^3

OSHA PEL: 10 mg[Fe]/m^3 TWA (dust and fume)

ACGIH TLV[1]: 5 mg[Fe]/m^3 (vapor, dust) TWA; not classifiable as a human carcinogen (2005)

DFG MAK: 1.5 mg[Fe]/m^3 respirable fraction

PAC Ver. 29[138]

1309-37-1, ferric oxide

PAC-1: 15 milligram per cubic meter

PAC-2: 360 milligram per cubic meter

PAC-3: 22000 milligram per cubic meter

Arab Republic of Egypt: TWA 3 ppm (5 milligram per cubic meter) (fume), 1993; Australia: TWA 5 milligram per cubic meter (fume), 1993; Austria: MAK 6 milligram per cubic meter (*dust*), 1999; Denmark: TWA 3.5 mg[Fe]/m^3, 1999; Finland: TWA 5 ppm (fume), 1999; France: VME 5 milligram per cubic meter (fume), 1999; the Netherlands: MAC-TGG 5 mg[Fe]/m^3, 2003; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Norway: TWA 3 milligram per cubic meter, 1999; the Philippines: TWA 10 milligram per cubic meter (fume), 1993; Poland: MAC (TWA) (fume) 5 milligram per cubic meter, MAC (STEL) 10 milligram per cubic meter, 1999; Sweden: NGV 3.5 milligram per cubic meter (fume), 1999; Switzerland: MAK-W 6 milligram per cubic meter) (fume), 1999; Thailand: TWA 10 milligram per cubic meter (fume), 1993; Turkey: TWA 10 milligram per cubic meter (fume), 1993; United Kingdom: TWA 5 mg[Fe]/m^3; STEL 10 mg [Fe]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Determination in Air: As iron oxide, use NIOSH Analytical Methods #7300, #7301,#7303, #9102; OSHA Analytical Methods ID-121, ID-125G.

Routes of Entry: Dust inhalation.

Harmful Effects and Symptoms

Long-Term Exposure: There is sufficient evidence for the carcinogenicity in humans of underground hematite mining (with exposure to radon). Underground hematite miners have a high incidence of lung cancer, whereas surface hematite miners do not. It is not known whether this excess risk may be due to hematite; to radon (a known lung carcinogen); to inhalation of ferric oxide or silica; or to a combination of these or other factors. Some studies of metal workers exposed to ferric oxide dusts have shown an increased incidence of lung cancer, while other studies have not. The influence of factors in the work-place, other than ferric oxide, cannot be eliminated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning, *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]. *125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *2,500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from other storage containers to process containers A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishing agents suitable for surrounding fires. Thermal decomposition products may include oxides of metal (fume). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

n-Heptane H:0160

Formula: C_7H_{16}; $CH_3(CH_2)_5CH_3$

Synonyms: Dipropal methane; Dipropyl methane; Dipropylmethane; *n*-Heptane; Heptyl hydride; Normal heptane; Skelly-Solve C

CAS Registry Number: 142-82-5

HSDB Number: 90

RTECS Number: MI7700000

UN/NA & ERG Number: UN1206/128

EC Number: 205-563-8 [*Annex I Index No.*: 601-008-00-2]

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity. Hazard Alert: Highly flammable, Drug; Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: risk phrases: F, Xn, N; R11; R38; R65; R67; R50/53; safety phrases: S2; S9; S16; S21; S29; S33; S60; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *n*-Heptane is a clear liquid which is highly flammable and volatile with a mild, gasoline-like odor. The odor threshold is 40−547 ppm; also reported @ 230 ppm. Molecular weight = 100.23; specific gravity (H_2O:1) = 0.68; boiling point = 98.5°C; freezing/melting point = −92°C; vapor pressure = 40 mmHg @ 22.3°C; flash point = −4°C; autoignition temperature = 204°C[17]; 285°C. Explosive limits: LEL = 1.1%; UEL: 6.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Practically insoluble in water; solubility = 0.0003%.

Potential Exposure: *n*-Heptane is used in graphics, textiles, adhesives, and coatings; as an industrial solvent and in the petroleum refining process; as a standard in testing knock of gasoline engines.

Incompatibilities: May form explosive mixture with air. Strong oxidizers may cause fire and explosions. Attacks some plastics, rubber and coatings. May accumulate static electric charges that can ignite its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 750 ppm

Conversion factor: 1 ppm = 4.10 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 500 ppm/2000 milligram per cubic meter TWA

NIOSH REL: 85 ppm/350 milligram per cubic meter TWA; 440 ppm/1800 milligram per cubic meter [15 minutes] Ceiling Concentration

ACGIH TLV[1]: 400 ppm/1640 milligram per cubic meter TWA; 500 ppm/2050 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 500 ppm
PAC-2: 830 ppm
PAC-3: 5000 ppm
DFG MAK: 500 ppm/2100 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D
Australia: TWA 400 ppm (1600 milligram per cubic meter); STEL 500 ppm, 1993; Austria: MAK 500 ppm (2000 milligram per cubic meter), 1999; Belgium: TWA 400 ppm (1640 milligram per cubic meter); STEL 500 ppm, 1993; Denmark: TWA 200 ppm (820 milligram per cubic meter), 1999; Finland: TWA 300 ppm (1200 milligram per cubic meter); STEL 500 ppm (2000 milligram per cubic meter), 1999; France: VME 400 ppm (1600 milligram per cubic meter), 1999; Japan: 200 ppm (820 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1200 milligram per cubic meter, 2003; Norway: TWA 200 ppm (800 milligram per cubic meter), 1999; the Philippines: TWA 500 ppm (2000 milligram per cubic meter), 1993; Poland: MAC (TWA) 1200 milligram per cubic meter, MAC (STEL) 2000 milligram per cubic meter, 1999; Russia: TWA 200 ppm, 1993; Sweden: NGV 200 ppm (800 milligram per cubic meter), KTV 300 ppm (1200 milligram per cubic meter), 1999; Switzerland: MAK-W 400 ppm (1600 milligram per cubic meter), KZG-W 800 ppm (3200 milligram per cubic meter), 1999; Turkey: TWA 500 ppm (2000 milligram per cubic meter), 1993; United Kingdom: LTEL 400 ppm (1600 milligram per cubic meter); STEL 500 ppm, 1993: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 500 ppm. Several states have set guidelines or standards for heptane in ambient air[60] ranging from 7.0 milligram per cubic meter (Connecticut and South Dakota) to 16.0−20.0 milligram per cubic meter (North Dakota) to 24.5 milligram per cubic meter (Virginia) to 32.0 milligram per cubic meter (Florida and New York) to 38.095 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1500, for Hydrocarbons, BP 36−126°C; OSHA Analytical Method 7.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = >4.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of the vapor, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *n*-Heptane irritates the eyes, skin, and respiratory tract. A narcotic at high concentrations. *n*-Heptane can cause dermatitis and mucous membrane irritation. Aspiration of the liquid may result in chemical pneumonitis, pulmonary edema; and hemorrhage. Systemic effects may arise without complaints of mucous membrane irritation. Exposure to high concentrations causes narcosis producing vertigo, a lack of coordination; intoxication characterized by hilarity, slight nausea; loss of appetite; and a persisting gasoline taste in the mouth. These effects may be first noticed on entering a contaminated area. *n*-Heptane may cause low order sensitization of the myocardium to epinephrine. Swallowing the liquid may cause chemical pneumonitis.

Long-Term Exposure: The liquid defats the skin causing dryness and irritation. May affect the central nervous system; liver. Many petroleum solvents similar to heptane can cause brain damage that can affect memory, concentration, mood, sleep patterns.

Points of Attack: Skin, respiratory system; lungs, peripheral nervous system.

Medical Surveillance: Preplacement examinations should evaluate the skin and general health, including respiratory, liver, and kidney function. Interview for brain effects. Consider cerebellar, autonomic and peripheral nervous system evaluation. Refer positive and borderline individuals for neuropsychological testing. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact; **8 hours**: nitrile rubber gloves, suits, boots; Viton gloves, suits; 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *750 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with heptane all handlers should be trained on its proper handling and storage. Before entering confined space where heptane may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1206 Heptanes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind and use water spray to “knock down” vapor. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

1-Heptanethiol H:0170

Formula: $C_7H_{16}S$

Synonyms: *n*-Heptylmercaptan; Heptyl mercaptan

CAS Registry Number: 1639-09-4

RTECS Number: MJ1400000

UN/NA & ERG Number: UN1228/131

EC Number: 216-678-8

Regulatory Authority and Advisory Information.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: 1-Heptanethiol is a flammable, colorless liquid with a strong odor. Molecular weight = 132.29; boiling point = 176°C; freezing/melting point = −43°C; flash point = 46°C. Insoluble in water.

Potential Exposure: Used as a chemical intermediate for fuels, dyes, pharmaceuticals; and to make other chemicals.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alkali metals and reducing agents.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.5 ppm/2.7 milligram per cubic meter [15-minutes] Ceiling Concentration

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Exposure can cause headache, dizziness, nausea, and vomiting. High concentrations of mercaptans may cause cold extremities, rapid pulse; increased respiration; drowsiness, cyanosis, and unconsciousness.

Long-Term Exposure: Unknown at this time.

Points of Attack: Eyes, skin, respiratory system; central nervous system; blood.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 5 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 25 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1228 Mercaptans, liquid, flammable, toxic, n.o.s. or Mercaptan mixtures, liquid, flammable, toxic, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include sulfur oxides, carbon monoxide, and hydrogen sulfide. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Heptene H:0180

Formula: C_7H_{14}; $C_3H_7CH{=}CHC_2H_5$

Synonyms: 1-Ethyl-2-propyl ethylene; *n*-Heptene; 1-Heptene; 1-Heptylene; Heptylene

CAS Registry Number: 592-76-7

HSDB Number: 1078

RTECS Number: MU8815000

UN/NA & ERG Number: UN2278/128

EC Number: 209-767-8 (see Appendix 4).

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Highly flammable liquid, Environmental hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R36/37/38; R51; R65; safety phrases: S16; S21; S26; S29; S36/37; S45; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters.

Description: Heptene is a colorless liquid. Mild, gasoline-like odor. Molecular weight = 98.21; boiling point = 94°C; vapor pressure = 59 mmHg @ 25°C; flash point = −10°C; autoignition temperature = 260°C. Explosive limits: LEL = 1.0%; UEL-unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in use as a plant growth retardant or in organic synthesis.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May react exothermically with reducing agents releasing flammable hydrogen gas.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 130 ppm

PAC-2: 1400 ppm

PAC-3: 8700 ppm

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Narcotic at higher concentrations; may act as a slight anesthetic. Inhalation can cause coughing, wheezing, and/or shortness of breath. May also act as simple asphyxiant.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149

(Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with heptene all handlers should be trained on its proper handling and storage. Before entering confined space where heptene may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2278 *n*-Heptene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Spills on water may be handled with oil skimming equipment and sorbent (polyurethane) foams. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R45; R48/25; R50/53; R62; R63; safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hexachlorobenzene is a solid, crystallizing in needles. Molecular weight = 284.76; boiling point = 323−326°C; freezing/melting point = 231 °C; flash point = 242°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: Hexachlorobenzene was used as a fungicide; an additive for pyrotechnic compositions; and as wood preservative. It was used widely as a pesticide to protect seeds of onions and sorghum, wheat, and other grains against fungus until 1965. This material was used to make fireworks; ammunition for military uses; synthetic rubber; as a porosity controller in the manufacture of electrodes; as an intermediate in dye manufacture; in organic synthesis. It is formed as a by-product of making other chemicals; in the waste streams of chloralkali and wood-preserving plants; and when burning municipal waste. Currently, there are no commercial uses of hexachlorobenzene in the United States.

Incompatibilities: Reacts violently with oxidizers; dimethyl formamide above 65°C.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: None

ACGIH TLV[1]: 0.002 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 0.006 milligram per cubic meter

PAC-2: 14 milligram per cubic meter

PAC-3: 91 milligram per cubic meter

DFG MAK: [skin]; Carcinogen Category 4; Pregnancy Risk Group D

France: carcinogen, 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter, 1999; Russia: STEL 0.9 milligram per cubic meter [skin], 1993; United Kingdom: carcinogen, 2000; the Netherlands: MAC-TGG 0.03 milligram per cubic meter, 2003. Russia set a MAC in ambient air of residential areas of 0.013 milligram per cubic meter. The Czech Republic[35] has set a TWA in work-place air of 1.0 milligram per cubic meter and an STEL of 2.0 milligram per cubic meter. Several states have set guidelines or standards for hexachlorobenzene in ambient air[60] ranging from zero in North Dakota to 0.48 ppb (Pennsylvania) to 0.03 μ/m^3 (New York).

Determination in Air: Use NIOSH Analytical Method (IV) #1003, Halogenated hydrocarbons.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.001 mg/L; MCLG, zero.

Federal Drinking Water Standards: EPA 1 μg/L; State Drinking Water Guidelines: Arizona 0.02 μg/L; Maine 0.2 μg/L; Minnesota 0.02 μg/L.

Determination in Water: Methylene chloride extraction followed by concentration and gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625). Fish Tox = 1760.07814000 ppb MATC (VERY LOW).

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* Coughing, shortness of breath and labored breathing have been reported from large, unmeasured doses or by decomposition to chlorine. *Skin:* Can cause irritation. Exposure to sunlight with (or soon after) exposure can increase effects. Following this reaction, changes in skin pigment and blistering may follow. Red or dark urine may be noticed. High doses may cause redness, pain and serious burns. *Eyes:* May cause irritation. Higher doses may cause redness, pain and blurred vision. *Ingestion:* Headache, dizziness, nausea, vomiting, numbness of hands and arms; apprehension, excitement, tremors, partial paralysis of arms and legs; loss of muscle control; loss of sensory perception; convulsions and coma may result from high doses. Human Tox = 1.00000 ppb (HIGH).

Long-Term Exposure: May cause liver or kidney problems; reproductive difficulties; increased risk of cancer. May cause liver, thyroid, and immune system damage. May affect the lungs, liver, skin, and nervous system. This substance causes cancer in laboratory animals, and may be carcinogenic to humans. May damage the developing fetus.

High, prolonged or repeated exposure may affect the nervous system. Repeated skin exposure can lead to permanent skin changes and increased hair growth. Animal tests show that this substance possibly causes toxic effects upon human reproduction. Ingestion of contaminated grain, estimated at doses of 0.05–0.2 g/day, resulted in *porphyria cutanea* tarda in Turkey, which is characterized by red-colored urine; skin sores; change in skin color; arthritis; and problems of the liver, nervous system; and stomach. The following symptoms were also reported: enlarged livers, *porphyria* in the blood; loss or appetite; weight loss and wasting of skeletal muscles. Severe and long-standing poisoning caused abnormal hair growth, loss of vision; wasting of hands; black discoloration; and skin sores which became ulcerated, healing with pigmented scars. Breast-fed children developed "pink-sore," a condition which was 95% fatal. Toxic effects on blood and active symptoms persisted up to 20 years. Studies in animals show that ingestion of this chemical can damage the liver, thyroid, nervous system; bones, kidneys, blood, immune, and endocrine system.

Points of Attack: Liver, skin, thyroid.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver function tests. Thyroid function tests. Evaluation by a qualified allergist and/or dermatologist. Iron as a dietary supplement could increase liver damage. consult a physician before taking supplements. Guard against sunlight exposure to contaminated skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician:* For ingestions of less than 10 mg/kg body weight occurring less than an hour before treatment, induce emesis. For ingestions of more than 10 mg/kg body weight occurring less than an hour before treatment, use gastric lavage. For ingestion occurring more than an hour before treatment, use activated charcoal. There is no specific antidote, and supervision for at least 72 hours is recommended.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *SCBA:* >0.006 milligram per cubic meter. *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, dimethyl formamide and heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2729 Hexachlorobenzene, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration is most effective @ 1300°C and 0.25 seconds. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hexachlorobutadiene is a clear, colorless liquid with a faint, turpentine-like odor. Molecular weight = 260.76; specific gravity (H_2O:1) = 1.56; boiling point = 215 °C; freezing/melting point = −21°C; vapor pressure = 0.2 mmHg @ 20°C; flash point = 90°C; autoignition temperature = 610°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 1. Insoluble in water.

Potential Exposure: Hexachlorobutadiene is used as a solvent; heat-transfer fluid; transformer fluid; hydraulic fluid; as a solvent for elastomers; as a wash liquor for removing higher hydrocarbons.

Incompatibilities: Strong reaction with oxidizers, aluminum powder. Attacks aluminum; some plastics, rubber and coatings

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.66 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.02 ppm/0.24 milligram per cubic meter TWA [skin]; suspected occupational carcinogen; limit exposures to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.02 ppm/0.21 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.
PAC* Ver. 29[138]
PAC-1: $\mathbf{1_E}$ ppm
PAC-2: $\mathbf{3_E}$ ppm
PAC-3: $\mathbf{10_E}$ ppm

DFG MAK: [skin]; Carcinogen Category 3B
Australia: TWA 0.02 ppm (0.24 milligram per cubic meter) [skin], carcinogen, 1993; Austria [skin], Suspected: carcinogen, 1999; Belgium: TWA 0.02 ppm (0.21 milligram per cubic meter) [skin], carcinogen, 1993; Finland: carcinogen, 1999; Norway: TWA 0.02 ppm (0.24 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.24 milligram per cubic meter, 2003; Switzerland: MAK-W 0.02 ppm (0.24 milligram per cubic meter) [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia[35,43] has set MAC values for ambient air in residential areas of 0.001 milligram per cubic meter on a momentary basis and 0.0002 mg on a daily average basis. Several states have set guidelines or standards for hexachlorobutadiene in ambient air[60] ranging from zero (North Dakota) to 0.72 μ/m^3 (Pennsylvania) to 0.80 μ/m^3 (New York) to 1.2 μ/m^3 (South Carolina) to 2.4 μ/m^3 (Connecticut, Florida, and Virginia) to 6.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2543.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 1 μg/L; State Drinking Water Guidelines: Florida 0.05 μg/L; Maine 4 μg/L; Minnesota 1 μg/L; New Hampshire 1 μg/L.

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = \sim 5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hexachlorobutadiene can affect you when breathed in and by passing through your skin. The liquid is corrosive; contact can irritate and burn the skin and eyes. Vapors can irritate the eyes, skin, and respiratory tract.

Long-Term Exposure: Hexachlorobutadiene should be handled as a carcinogen-with extreme caution. It may damage the developing fetus. Exposure can cause severe kidney damage. Hexachlorobutadiene may damage the liver. Repeated or prolonged contact may cause skin sensitization and allergy.

Points of Attack: Eyes, skin, respiratory system; kidneys. Cancer site in animals: kidney tumors.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, the following are recommended: kidney and liver function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 0.02 ppm*; Use a MSHA/NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where hexachlorobutadiene is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2279 Hexachlorobutadiene, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not flammable. Use extinguishing agents suitable for surrounding fire. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High temperature incineration with flue gas scrubbing[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Description: BHC is a white-to-brownish crystalline solid with a musty, phosgene-like odor. Molecular weight = 290.82; freezing/melting point = 65°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. BCH consists of eight stereoisomers of which the *gamma* (γ) isomer is most insecticidally active and hence most important. See also "Lindane."

Potential Exposure: The major commercial usage of BHC is based upon its insecticidal properties. α-BCH is used as an Agricultural chemical, pesticide, pharmaceutical, and veterinary drug. The 7-isomer has the highest acute toxicity, but the other isomers are not without activity. It is generally advantageous to purify the 7-isomer from the less active isomers. The γ-isomer acts on the nervous system of insects, principally at the level of the nerve ganglia. As a result, lindane has been used against insects in a wide range of applications including treatment of animals, buildings, humans for ectoparasites, clothes; water for mosquitoes; living plants; seeds and soils. Some applications have been abandoned due to excessive residues, e.g., stored foodstuffs. By voluntary action, the principal domestic producer of technical grade BHC requested cancellation of its BHC registrations on September 1, 1976. As of July 21, 1978, all registrants of pesticide products containing BHC voluntarily canceled their registrations or switched their former BHC products to lindane formulations.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Decomposes on contact with powdered iron, aluminum, zinc, and on contact with strong bases producing trichlorobenzene.

Permissible Exposure Limits in Air

ACGIH TLV[1]: as *gamma*-isomer: 0.5 milligram per cubic meter [skin]

DFG MAK: as gamma-isomer: 0.1 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(8) [skin] Carcinogen Category 4; Pregnancy Risk Group C (2006)

Technical grade, mixture of α-BHC (CAS: 319-84-6) and β-BHC (CAS: 319-85-7): 0.1 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(8) [skin]

PAC Ver. 28, no values found in Ver. 29[138]

608-73-1 technical grade, mixed isomers of (*α-* & *β-isomer*s)

PAC Ver. 29[138]

PAC-1: 9.1 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

DFG MAK (concentration α-HCH divided by 5) + concentration β-HCH; 0.5 milligram per cubic meter, inhalable fraction TWA; Peak Limitation Category II(8) [skin]

Australia: TWA 0.5 milligram per cubic meter [skin], 1993; Belgium: TWA 0.5 milligram per cubic meter [skin], 1993; Denmark: TWA 0.5 milligram per cubic meter [skin], 1999; Finland: TWA 0.5 milligram per cubic meter [skin], carcinogen, 1999; France: VME 0.5 milligram per cubic meter [skin], 1993; Hungary: TWA 0.5 milligram per cubic meter; STEL 0.1 milligram per cubic meter [skin], 1993; Poland: MAC (TWA) 0.05 milligram per cubic meter, MAC (STEL) 0.4 milligram per cubic meter, 1999; Russia: STEL 0.05 milligram per cubic meter; 0.1 milligram per cubic meter; momentary and daily average [skin], 1993; Switzerland: MAK-W 0.5 milligram per cubic meter [skin], 1999; United Kingdom: LTEL 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter [skin], 1993. Russia[43] set a MAC value for ambient air in residential areas of 0.03 milligram per cubic meter on a momentary and on a daily average basis.

319-84-6, α-isomer, *319-85-7, β-isomer*

PAC Ver. 29[138]

PAC-1: 9.1 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

Australia: TWA 0.5 milligram per cubic meter [skin], 1993; Belgium: TWA 0.5 milligram per cubic meter [skin], 1993; Denmark: TWA 0.5 milligram per cubic meter [skin], 1999; Finland: TWA 0.5 milligram per cubic meter [skin], carcinogen, 1999; France: VME 0.5 milligram per cubic meter [skin], 1993; Hungary: TWA 0.5 milligram per cubic meter; STEL 0.1 milligram per cubic meter [skin], 1993; Russia: STEL 0.05 milligram per cubic meter; [skin], 1993; Switzerland: MAK-W 0.5 milligram per cubic meter [skin], 1999; United Kingdom: LTEL 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter [skin], 1993

319-85-7, β-isomer

Austria: MAK 0.5 milligram per cubic meter [skin], 1999; Denmark: TWA 0.5 milligram per cubic meter [skin], 1999; Switzerland: MAK-W 0.5 milligram per cubic meter [skin], 1999

Determination in Air: Collection by filter/bubbler; workup with isooctane; analysis by gas chromatography/electrolytic conductivity detection; NIOSH Analytical Method (IV) #5502 (γ-isomer).

Permissible Concentration in Water: The EPA has set a limit in drinking water of 0.2 ppb. There are no criteria for the protection of freshwater or saltwater aquatic life from technical BHC (mixed isomers) due to insufficient data. *To protect human health:* preferably zero for technical product. An additional cancer risk of 1 in 100,000 is imposed by a concentration of 0.123 μg/L[6]. Russia[43] set a MAC in water bodies used for domestic purposes of 0.02 mg/L and zero in water bodies used for fishery purposes.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and respiratory tract. May affect the central nervous system; causing convulsions, respiratory failure; and collapse. Effects may be delayed. Exposure may result in death. See also below.

Long-Term Exposure: Repeated or prolonged skin contact may cause irritation, redness. The effects of lindane and/or the α-, β-, and δ-isomers of HCH observed in humans are lung irritation, heart disorders; blood disorders; headache, convulsions; and changes in the levels of sex hormones.

These effects have occurred in workers exposed to HCH vapors during pesticide formulation and/or in individuals exposed accidentally or intentionally to large amounts of HCH. Exposure to excessive amounts of HCH can also result in death in humans and animals. Convulsions and kidney disease have been reported in animals fed lindane or β-HCH. Liver disease has been reported in animals fed lindane and α-, β-, or technical grade HCH. Longer exposure to lindane and α-, β-, or technical-grade HCH has been reported to result in liver cancer. Reduced ability to fight infection was reported in animals fed lindane and injury to the ovaries and testes was reported in animals exposed to lindane or β-HCH. In animals, there is evidence that oral exposure to lindane during pregnancy results in an increased incidence of fetuses with extra ribs. HCH is processed by the body into other chemical products, some of which probably are responsible for the harmful effects. The Department of Health and Human Services has determined that HCH may reasonably be anticipated to be carcinogenic. Liver cancer has been seen in laboratory rodents that ate HCH for long periods of time.

Points of Attack: Eyes, skin, respiratory system; central nervous system; blood, liver, kidneys

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests for Lindane: whole blood (chemical/metabolite); blood serum; Complete blood count (CBC); urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). *NIOSH: up to 5 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 milligram per cubic meter:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode);or PaprOvHie* (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 25 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter; GmFOv100 (APF = 50) [or any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie* (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 50 milligram per cubic meter:* 100XQ (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators]. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis, powdered iron, aluminum, and zinc. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may be dissolved in flammable liquids. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include phosgene and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A process has been developed for the destructive pyrolysis of benzene hexachloride @ 400−500°C with a catalyst mixture which contains 5−10% of either cupric chloride, ferric chloride; zinc chloride; or aluminum chloride on activated carbon.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hexachlorocyclopentadiene is a pale-yellow to amber-colored, oily liquid. Pungent, unpleasant odor. The odor threshold is 0.15−0.33 ppm. Molecular weight = 272.77; specific gravity (H_2O:1) = 1.7 @ 20°C; boiling point = 239 °C; freezing/melting point = −9°C; vapor pressure = 0.06 mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 1. Slightly soluble in water; solubility = 0.0002% @ 25°C (reaction).

Potential Exposure: Hexachlorocyclopentadiene is used to produce the flame retardant chlorendic anhydride, which has applications in polyesters; and to produce chlorendic anhydride and chlorendic acid; which is used as a flame retardant in resins. Hexachlorocyclopentadiene is also used as an intermediate in the production of pesticides, such as aldrin, dieldrin, and endosulfan.

Incompatibilities: Reacts slowly with water to form hydrochloric acid; will corrode iron and most metals in presence of moisture. Explosive hydrogen gas may collect in enclosed spaces in the presence of moisture. Contact with sodium may be explosive.

Permissible Exposure Limits in Air

Odor Threshold = 0.15−0.33 ppm.

OSHA PEL: None

NIOSH REL: 0.01 ppm/0.1 milligram per cubic meter TWA

ACGIH TLV[1]: 0.01 ppm/0.11 milligram per cubic meter TWA; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 0.03 ppm

PAC-2: 0.55 ppm

PAC-3: 1 ppm

DFG MAK: [skin] No numerical value established. Data may be available.

Australia: TWA 001 ppm (0.1 milligram per cubic meter), 1993; Belgium: TWA 0.01 ppm (0.11 milligram per cubic meter), 1993; Denmark: TWA 0.01 ppm (0.1 milligram per cubic meter), 1999; Finland: TWA 0.1 ppm (1 milligram per cubic meter); STEL 0.3 ppm (3 milligram per cubic meter) [skin], 1999; France: VME 0.01 ppm (0.1 milligram per cubic meter), 1999; Norway: TWA 0.01 ppm (0.1 milligram per cubic meter), 1999; Russia: STEL 0.01 milligram per cubic meter [skin], 1993; the Netherlands: MAC-TGG 0.11 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for hexachtorocyclopentadiene in ambient air[60] ranging from 0.015 μ/m^3 (Massachusetts) to 0.33 μ/m^3 (New York) to 0.50 μ/m^3 (Indiana and South Carolina) to 0.6−10.0 μ/m^3 (North Carolina) to 1.0 μ/m^3 (Florida and North Dakota) to 2.0 μ/m^3 (Connecticut, Nevada and Virginia).

Determination in Air: Sample collection on Porapak tube[2] desorption with hexane and analysis by gas chromatography with electron capture detection. See NIOSH Analytical Method (IV) #2518[18].

Permissible Concentration in Water: The Safe Drinking Water Act (47FR 9352): MCL, 0.05 mg/L; MCLG, 0.05 mg/L. EPA recommends that exposure in children should not exceed 2 ppm in water for 10-day periods or no more than 0.7 ppm for up to 7 years.

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This compound is very toxic and may be fatal if inhaled, swallowed, or absorbed through the skin. Eye contact may result in severe irritation. Contact of liquid with the skin may cause blistering and burning. Inhalation of mist is highly irritating to mucous membranes; causing tearing, sneezing, and salivation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Headaches and throat irritation have also been reported as a result of exposure to this compound. The probable human lethal dose is 50−500 mg/kg, or between 1 teaspoon and 1 ounce for a 150 lb (70 kg) person. Severe exposure induces pulmonary hyperemia and edema, degenerative and necrotic changes in brain, heart and adrenal glands; and necrosis of liver and kidney tubules.

Long-Term Exposure: May cause kidney and stomach problems, nervous system; and heart problems; possible liver damage. Can irritate the lungs. Repeated exposure may cause chronic bronchitis with cough, phlegm and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, stomach.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: liver and kidney function tests. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: lung, liver and kidney function tests. Exam of the nervous system. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from the skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber/Neoprene and PVC are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 0.01 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water. Protect containers from physical damage. In the presence of moisture, hexachlorocyclopentadiene will corrode iron and other metals.

Shipping: UN2646 Hexachlorocyclopentadiene, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424−9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548−8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.3/0.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. *Do not use water* or wet method. Ventilate area of spill or leak after clean-up is complete. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Hexachlorocyclopentadiene itself does not burn. Thermal decomposition products may include chlorine, hydrogen chloride, phosgene, and carbon monoxide. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hexachloroethane is a white solid with a camphor-like odor. It gradually evaporates when it is exposed to air. Molecular weight = 236.72; boiling point = (sublimes) @ 183−187°C; freezing/melting point = (sublimes) 187°C; vapor pressure = 0.2 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Practically insoluble in water; solubility = 0.005% @ 25°C.

Incompatibilities: Incompatible with strong acids, oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from strong bases.

Potential Exposure: In the US, about half the HCE is used by the military for smoke-producing devices. It is also used to remove air bubbles in melted aluminum. It may be present as an ingredient in some fungicides, insecticides, lubricants, and plastics. It is no longer made in the United States, but it is formed as a by-product in the production of some chemicals. Can be formed by incinerators when materials containing chlorinated hydrocarbons are burned. Some HCE can also be formed when chlorine reacts with carbon compounds in drinking water. As a medicinal, HCE is used as an anthelmintic to treat fascioliasis in sheep and cattle. It is also added to the feed of ruminants, preventing methanogenesis and increasing feed efficiency. HCE is used in metal and alloy production, mainly in refining aluminum alloys. It is also used for removing impurities from molten metals, recovering metals from ores or smelting products and improving the quality of various metals and alloys. HCE is contained in pyrotechnics. It inhibits the explosiveness of methane and the combustion of ammonium perchlorate. Smoke containing HCE is used to extinguish fires. HCE has various applications as a polymer additive. It has flameproofing qualities, increases sensitivity to radiation crosslinking, and is used as a vulcanizing agent. Added to polymer fibers, HCE acts as a swelling agent and increases affinity for dyes.

Incompatibilities: Incompatible with metals, such as aluminum, cadmium, hot iron; mercury, or zinc. Alkalis forms spontaneously explosive chloroacetylene. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 300 ppm, potential occupational carcinogen

Conversion factor: 1 ppm = 9.68 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm/10 milligram per cubic meter TWA [skin]

NIOSH REL: NIOSH REL: 1 ppm/10 milligram per cubic meter TWA[skin]; a potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV[1]: 1 ppm/9.7 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 3 ppm

PAC-2: 36 ppm

PAC-3: 300ppm

DFG MAK: 1 ppm/9.8 milligram per cubic meter TWA; Peak Limitation Category II(2)

Australia: TWA 10 ppm (100 milligram per cubic meter), 1993; Austria: MAK 1 ppm (10 milligram per cubic meter), 1999; Belgium: TWA 1 ppm (9.7 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (10 milligram per cubic meter) [skin] 1999; Finland: TWA 1 ppm (10 milligram per cubic meter), short term exposure limit 3 ppm (30 milligram per cubic meter) [skin] 1999; France: VME 1 ppm, VLE 10 ppm, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; the Philippines: TWA 1 ppm (10 milligram per cubic meter) [skin] 1993; Poland: MAC (TWA) 10 milligram per cubic meter, MAC (STEL) 30 milligram per cubic meter, 1999; Switzerland: MAK-W 1 ppm (10 milligram per cubic meter) [skin] 1999; United Kingdom: TWA 5 ppm (49 milligram per cubic meter), vapor, 2000; United Kingdom: TWA 10 milligram per cubic meter, total inhalable dust; TWA 4 milligram per cubic meter, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for hexachloroethane in ambient air[60] ranging from 0.18 μ/m^3 (Massachusetts) to 50.0 μ/m^3 (Connecticut) to 238.095 μ/m^3 (Kansas) to 1000 (μ/m^3 (North Dakota) to 1600 μ/m^3 (Virginia) to 2381 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated; OSHA Analytical Method 7.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 1 μg/L; State Drinking Water Guidelines: Maine 7 μg/L

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate and burn the eyes and skin. Exposure can irritate the respiratory tract. High levels of exposure can cause dizziness, lightheadedness, and unconsciousness. Irritation occurs when there is an excessive amount of hexachloroethane dust in the air or when it is heated and vapors are formed. Hexachloroethane acts primarily as a central nervous system depressant; and in high concentrations it causes tremors, and narcosis. It should be noted that the low vapor pressure of this compound as well as its solid state minimize its inhalation hazards.

Long-Term Exposure: A potential occupational carcinogen. May cause kidney and liver damage.

Points of Attack: Eyes, skin, respiratory system; kidneys. Cancer site in animals: liver cancer.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. More than light alcohol consumption can exacerbate liver damage. Sample of blood, urine, or feces can be tested for exposure to HCE. These tests are useful only if exposure occurred 24 to 48 hours prior to testing.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Hexachloroethane must be stored to avoid contact with hot iron, zinc, aluminum, and alkalis, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Hexachloroethane itself does not burn. Thermal decomposition products may include phosgene and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N; risk phrases: R10; R23/24/25; R39; R50/53; R62; R63; safety phrases: S1/2; S16; S20; S37/38; S41; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]
Description: Hexachlorophene is a crystalline solid compound. Molecular weight = 406.89; freezing/melting point = 165°C. Flash point = 11°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Insoluble in water.
Potential Exposure: HCP has been used as an antibacterial agent in a wide variety of consumer products, including soaps and deodorants; as a disinfectant. It has also been used as an antifungal agent to treat various citrus fruits and vegetables.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.
Permissible Exposure Limits in Air
PAC Ver. 28, no value in Ver. 29[138]
PAC-1: 0.17 milligram per cubic meter
PAC-2: 1.8 milligram per cubic meter
PAC-3: 11 milligram per cubic meter
Russia: STEL 0.1 milligram per cubic meter [skin], 1993. Massachusetts[61] has set a guideline for ambient air of zero.
Permissible Concentration in Water: A no-adverse-effect-level in drinking water has been calculated by NAS/NRC as 0.008 mg/L. An ADI was calculated on the basis of the available chronic toxicity data to be 0.0012 mg/kg/day.

Russia set a MAC in water bodies used for domestic purposes of 0.03 mg/L. Maine has set a guideline for drinking water of 2.0 μg/L[61].

Determination in Water: Log $K_{ow} = > 7$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Hexachlorophene may irritate the eyes and skin, and cause a skin allergy to develop. May cause permanent eye damage. Inhaling can irritate the respiratory tract. May affect the central nervous system; causing dizziness, weakness, convulsions (fits), coma, or death. Exposure can cause loss of appetite; nausea, vomiting, cramps and diarrhea. LD_{50} (oral-rat) = 56 mg/kg; (oral-mouse) 67 mg/kg.

Long-Term Exposure: There is an association between exposure to pregnant women to hexachlorophene and birth defects. There is limited evidence that hexachlorophene is a teratogen in animals. May cause an asthma-like allergy. May cause liver damage. Repeated exposure may cause brain damage leading to paralysis and blindness.

Points of Attack: Nervous system, skin, liver, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system. Eye exam. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. More than light alcohol consumption may exacerbate liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to hexachlorophene, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: UN2875 Hexachlorophene, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of carbon. Hexachlorophene itself does not burn. Extinguish fire using an agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Hexaflumuron H:0248

Formula: $C_{16}H_{18}Cl_2F_6N_2O_3$

Synonyms: AI3-29832; Benzamide, *N*-[((3,5-dichloro-4-(1,1,2,2-tetrafluoroethoxy)phenyl)amino)carbonyl]-2,6-difluoro-; Conhex; Consult; DE-473; NAF-46; Recruit; Sonet; Trueno; XRD 473

CAS Number: 86479-06-3

HSDB Number: 7049

RTECS Number: CV3800000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 401-400-1

Regulatory Authority and Advisory Information

Carcinogenicity: Rats and mice fed up to 500 mg/kg/day for 104 weeks did not develop cancer[162]. Not expected to increase the risk cancer in humans.

Hazard Alert: Environmental hazard[162].

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R50/53; safety phrases: S2; S29/35; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: White solid or powder. The commercial product may be an emulsifiable concentrate. Molecular weight = 461.16; specific gravity (H_2O:1) = 1.675 @ 25°C; boiling point = (decomposes); freezing/melting point = 203°C; vapor pressure = 5×10^{-7} mmHg (very low/negligible). Practically insoluble in water; solubility = <0.1 ppm. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Hexaflumuron is a benzoyl urea insecticide, termiticide and insect growth regulator (IGR) that inhibits an insect's growth through chitin synthesis, which termites need to form an exoskeleton. It is used to impregnate termite bait. Worldwide, there are more than 20 suppliers/manufacturers[97]; most are in the United States Not currently registered for agricultural use in some EU countries.

Incompatibilities: Decomposes in temperatures above 275°C. Irritating or toxic fumes or gases in a fire

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = >5.0$. Values above 3.0 are likely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Intermediate—28.07482 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Dermal contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air purifying respirators for pesticides. May be harmful if swallowed. LD_{50} (oral, rat) = >5 g/kg; LD_{50} (dermal, rat) ≥ 5 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. May effect the blood; formation of methemoglobin. In long-term (chronic) feeding tests, hexaflumuron increased the incidence and severity of a liver cell abnormality[83].

Points of Attack: Blood, eyes, kidney, liver, bones.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: Lung function tests. If overexposure is suspected, also consider: CBC and test for methemoglobin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical-resistant suit[83] such as DuPont Tychem suit fabrics.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or where they might spill or leak into wells, drains, ground water, or surface water. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Dampen the spilled material with water. Clean up with dampened absorbent paper and transfer material to a suitable trash container. Seal the absorbent paper and your clothing in a vapor-tight plastic bag for eventual disposal. Wash all contaminated surfaces with a soap and water solution. Do not re-enter the contaminated area until and expert verifies that the area has been properly cleaned.

Fire Extinguishing: Thermal decomposition products in fire include toxic nitrogen oxides, hydrogen chloride, and hydrogen fluoride. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+ ; risk phrases: R5; R14; R21; R23/24/25; R27/28; R34; R50/53; R63; safety phrases: S1; S7; S9; S13; S26; S28; S33; S36; S38; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hexafluoroacetone is a colorless, nonflammable poison gas. Musty odor. Shipped as a liquefied compressed gas. Molecular weight = 166.0; boiling point = −27°C; freezing/melting point = −126°C; Relative vapor density (air = 1) = 5.76; vapor pressure = 750 mmHg @ −28°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Reacts with water.

Potential Exposure: Hexafluoroacetone is used as a chemical intermediate. A gas at room temperature, it forms various hydrates with water which are used as solvents for resins and polymers. Other derivatives are used to make water repellent coatings for textiles and also to produce polymers.

Incompatibilities: Reacts with water, oxidizers, strong acids. Hygroscopic (i.e., absorbs moisture from the air); reacts with moisture to form a highly acidic sesquihydrate and considerable heat.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.1 ppm/0.7 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.1 ppm/0.68 milligram per cubic meter TWA [skin]

PAC* Ver. 29[138]

684-16-2

PAC-1: 0.018 ppm

PAC-2: **0.2**$_{\mathbf{A}}$ ppm

PAC-3: **80**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minutes values.

Several states have set guidelines or standards for hexafluoroacetone in ambient air[60] ranging from 7.0 μ/m^3 (North Dakota) to 11.0 μ/m^3 (Virginia) to 14.0 μ/m^3 (Connecticut) to 17.0 μ/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can severely irritate the eyes, nose, throat, and skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headache, nausea, vomiting, dizziness, and lightheadedness. Skin or eye contact with the liquid can cause frostbite.

Long-Term Exposure: There is a limited evidence that this chemical is a teratogen in animals. It may damage the testes (male reproductive glands) and affect sperm production. Hexafluoroacetone can damage the liver, kidneys and lungs. Repeated exposure may cause bronchitis. Prolonged exposure may affect blood cells.

Points of Attack: Eyes, skin, respiratory system; kidneys, reproductive system.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 seconds); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, reproductive history for men. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear solvent resistant gloves and clothing to prevent any reasonable probability of skin or eye contact. Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with the liquid unless full

facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 0.1 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from direct sunlight; water, heat, reducing agents; nitrates, and nitric acid. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2420 Hexafluoroacetone, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone B. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60

Then: Protect persons downwind (mi/km)

Day 0.2/0.3

Night 0.9/1.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 3000/1000

Then: Protect persons downwind (mi/km)

Day 4.77/7.5

Night 7.0+/11.0+*

*+ means distance can be larger in certain atmospheric conditions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. If hexafluoroacetone gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: HFA is nonflammable reactive gas. This gas is under pressure; containers may rupture and explode when heated. Thermal decomposition includes hydrogen fluoride and oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Hexafluoroethane H:0260

Formula: C_2F_6

Synonyms: Ethane, hexafluoro-; F116; Freon 116; Perfluoroethane; R-116

CAS Registry Number: 76-16-4

HSDB Number: 7870 as perfluoroethane

RTECS Number: KI4110000

UN/NA & ERG Number: UN2193/126

EC Number: 200-939-8 (see Appendix 4).

Regulatory Authority and Advisory Bodies

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated,

Global Warming Potential (GWP): (AR2) 9200; (AR4) 12,200; Ozone depletion potential = zero

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R5; R21; safety phrases: S9; S33; S38 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Hexafluoroethane is a colorless and odorless gas, or liquid under pressure. Molecular weight = 138.02; specific gravity (Air:1) = 4.76 @ 20°C; boiling point = −78°C. Explosive limits: LEL = 20,000 ppm; UEL: unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: It is used as a coolant, in dielectric fluids; as a propellant and refrigerant.

Incompatibilities: Active metals. Keep away from heat and sunlight.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 100 ppm

PAC-2: 1100 ppm [> = 10% LEL, lower explosive limit]

PAC-3: 6800 ppm [> = 10% LEL, lower explosive limit but <50% LEL]

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Hexafluoroethane can affect you when breathed in. Contact with the liquefied gas could cause frostbite. High levels in the air can cause you to feel dizzy, lightheaded, and to pass out. Very high levels could cause suffocation from lack of oxygen and death. Overexposure may also cause abnormal heart rhythms and even cause the heart to stop.

Points of Attack: Heart.

Medical Surveillance: Special 24-hour EKG (Holter monitor). Consider chest X-ray following acute overexposure.

NIOSH lists the following tests as (F): chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles, unless full facepiece respiratory protection is worn. Wear splash chemical goggles and face shield when working with the liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Where exposure to cold equipment, vapors, or liquid may occur employees should be provided with special clothing designed to prevent the freezing of body tissues.

Respirator Selection: Where there is potential for exposures to hexafluoroethane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from metals, including aluminum, zinc and beryllium; and from open flames or temperatures above 52°C. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2193 Hexafluoroethane or Refrigerant gas R-116, Hazard Class: 2.2; Labels: 2.2-Nonflammable compressed gas.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Hexafluoroethane is a nonflammable liquid and gas. Use extinguishing agents suitable for type of surrounding fire. Thermal decomposition products may include hydrogen fluoride (hydrofluoric acid) and other fluoride gases. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Hexafluoroethane, Trenton, NJ (March, 1999).

1,1,1,3,3,3-Hexafluoro-2-Propanol H:0265

Formula: $C_3H_2F_6O$

Synonyms: Bis(trifluoromethyl)methanol; 1,1,1,3,3,3-Hexafluoro-2-hydroxypropane; 1,1,1,3,3,3- Hexafluoroisopro panol; Hexafluoroisopropanol; Hexafluoroisopropyl alcohol; 1,1,1,3,3,3-Hexafluoroisopropyl alcohol; 2,2,2-Trifluoro-1-(trifluoromethyl)ethanol; HFIP

CAS Registry Number: 920-66-1

RTECS Number: UB6450000

UN/NA & ERG Number: UN1760 (Corrosive liquid, n.o.s.)/154

EC Number: 213-059-4

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive liquid. Listed in the TSCA inventory. SARA 311/312 codes: Immediate.

Canada: WHMIS Classification: D1B, E; Found on DSL list.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C; risk phrases: R20/21; R25; R34; R41; safety phrases: S36; S37/39; S41 (see Appendix 4).

Description: 1,1,1,3,3,3-Hexafluoro-2-propanol (HFIP) is a clear, colorless, oily, combustible liquid. Odor is described as aromatic. Molecular Weight = 168.1; specific gravity (H_2O:1) = 1.46 @ 20°C; freezing/melting point = −4°C; boiling point = 59°C @ 760 mmHg; vapor pressure = 556 mmHg @ 51°C; 1468 mmHg @ 75°C; flash point: >93°C. Hazard identification (based on NFPA-704 M Rating System): Health 3; flammability 0; reactivity 0. Water soluble; solubility = ≥ 100 mg/mL @20°C.

Potential Exposure: A specialty solvent for some polymers; a lavatory reagent.

Incompatibilities: HFIP is incompatible with acids, acid chlorides, and oxidizing agents.

Permissible Exposure Limits in Air:

PAC Ver. 29[138]

PAC-1: 1.3 ppm
PAC-2: 15 ppm
PAC-3: 87 ppm

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.7$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, inhalation, or absorbed through the skin. Causes burns by all exposure routes.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive; causes burns to all internal or external area of contact. Dangerous if inhaled, swallowed, or absorbed through skin. Highly toxic-by-inhalation. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Can cause blindness; immediate washing of the eye may not lessen the magnitude of eye damage. Prolonged skin contact may cause large blisters. Depending on the intensity and duration of exposure, this chemical can cause severe destruction of tissues of the mucous membranes and upper respiratory tract. Symptoms of exposure to this compound may include severe skin and eye irritation, irritation of the mucous membranes and upper respiratory tract; burning feeling, laryngitis; coughing and wheezing, shortness of breath, headache, nausea, and vomiting; blurred vision; incoordination. Inhalation of this chemical can be fatal, resulting from inflammation, bronchial pneumonia, edema of the larynx, bronchi, and pulmonary tract. LD_{50} (oral-rat) = 1500 mg/kg.

Long-Term Exposure: The chronic properties of this material have not been fully investigated. May cause permanent skin damage; scarring. Repeated exposure to a highly toxic material such as HFIP may result in general deterioration of health and possible organ damage.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin or respiratory tract allergy.

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Maintain eye wash fountain and quick-drench facilities in work area. Unless full facepiece respiratory protection is worn, wear splash-proof protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Wear Tyvek-type disposable protective clothing or other impervious protective clothing, gloves, lab coat, apron or coveralls, as appropriate, to prevent skin contact. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: When working with this chemical, wear a NIOSH-approved full face chemical cartridge respirator equipped with the appropriate organic vapor cartridges. If that is not available, a half face respirator similarly equipped plus airtight goggles can be substituted. However, please note that half face respirators provide a substantially lower level of protection than do full face respirators.

Storage: Color code—White stripe (store separately): Contact Hazard; not compatible with materials in solid white category. Storage precautions: you should store this chemical in a refrigerator and keep it away from oxidizing materials. Store away from sources of ignition. Protective clothing minimum protective clothing: if Tyvek-type disposable protective clothing is not worn during handling of this chemical, wear disposable Tyvek-type sleeves taped to your gloves.

Shipping: UN1760 Corrosive liquids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: First remove all sources of ignition. Then, use absorbent paper to pick up all liquid spill material. Seal the absorbent paper, as well as any of your clothing which may be contaminated, in a vapor-tight plastic bag for eventual disposal. Wash any surfaces you may have contaminated with a soap and water solution. Do not reenter the contaminated.

Fire Extinguishing: Thermal decomposition products include fluorine. On fire involving this compound, use dry chemical, carbon dioxide, or Halon extinguisher. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be incinerated. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Hexamethylenediamine H:0270

Formula: $C_6H_{16}N_2$; $H_2N(CH_2)_6NH_2$

Synonyms: 1,6-Diaminohexane; 1,6-Hexamethylene diamine; Hexamethylenediamine; 1,6-Hexanediamine; HMDA; NCI-C61405

CAS Registry Number: 124-09-4

HSDB Number: 189

RTECS Number: MO1180000

UN/NA & ERG Number: UN2280 (solid)/153; UN1783 (solution)/153

EC Number: 204-679-6 [*Annex I Index No.:* 612-104-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Corrosive, Polymerization hazard, Suspected of causing genetic defects.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R21/22; R34; R36/37; R62; safety phrases: S1/2; S22; S24/25; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: HMDA is a hygroscopic, colorless solid (pellets or flakes). Weak, fishy odor. Molecular weight = 116.13; boiling point = 199°C; freezing/melting point = 39–42°C; flash point = 71°C; 81°C (solution); autoignition temperature = 310°C. Explosive limits: LEL = 0.7%; UEL: 6.3%. Hygroscopic, soluble in water; ₩ vigorous reaction releasing high levels of carbon dioxide; aqueous solution is strongly basic.

Potential Exposure: HMDA is used as a textile intermediate; a raw material for nylon fiber and plastics; in wet strength resins; in the manufacture of oil-modified and moisture-area types of urethane coatings; in the manufacture of polyamides for printing inks, dimer acids, and textiles; and as an oil and lubricant additive (probably as a corrosion inhibitor); as boiler feed water additives; also used in paints and as a curing agent for epoxy resins; making adhesives.

Incompatibilities: May form explosive mixture with air. The aqueous solution is a strong base and a strong reducing agent. Reacts violently with oxidizers, acids, acid chlorides; acid anhydrides; carbon dioxide acids. Reacts on contact with water forming carbon dioxide. Polymermizes in temperatures >195°C. Reacts with ethylene dichloride, organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks aluminum, copper, lead, tin, zinc and alloys. Absorbs carbon dioxide and water from air. Store under Nitrogen.

Permissible Exposure Limits in Air

Odor Threshold = 0.004 milligram per cubic meter

OSHA PEL: None

NIOSH REL: None

ACGIH TLV[1]: 0.5 ppm/2.3 milligram per cubic meter TWA *as 1,6-hexanediamine*

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Hungary: TWA 1 milligram per cubic meter; STEL 2 milligram per cubic meter [skin], 1993; Russia: STEL 0.1 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 2.3 milligram per cubic meter, 2003. Russia set a MAC in the ambient air of residential areas of 0.001 milligram per cubic meter on a momentary and a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.01 mg/L.

Harmful Effects and Symptoms

Short-Term Exposure: A very corrosive substance. Severely irritates and burns the eyes, skin, and respiratory tract. Can cause permanent eye damage. Inhalation can cause nosebleeds, sore throat; hoarseness, cough, phlegm and/or difficult breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. LD_{50} (oral-rat) = 750 mg/kg (slightly toxic).

Long-Term Exposure: Repeated or prolonged exposure can cause dermatitis, eczema, and liver damage, including hepatitis. There is limited evidence that this chemical can damage the developing fetus. Repeated exposure may cause bronchitis.

Points of Attack: Lungs, skin, liver.

Medical Surveillance: lung function tests, liver function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If convulsions are not present, give a glass or two of water or milk to dilute the substance. Do not induce vomiting. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Store under nitrogen. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a cool, dry place away from oxidizers, strong acids; acid chlorides; acid anhydrides; carbon dioxide; and metals. Preferably store under an inert atmosphere in a tightly closed container.

Shipping: UN2280 Hexamethylenediamine, solid, Hazard class: 8; Labels: 8-Corrosive material. UN1783 Hexamethylenediamine, solution, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Establish forced ventilation to keep levels below explosive limit. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Solid:* This chemical as a solid may burn but does not easily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Liquid: This chemical in solution is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

EC Number: 212-485-8 [*Annex I Index No.:* 615-011-00-1]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Violently water reactive, Polymerization hazard (high temp.), Sensitization hazard, Agricultural Chemical.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

European/International Regulations (*822-06-0*): Hazard symbol: T, Xi; risk phrases: R14/15; R23; R29; R36/37/38; R42/43; safety phrases: S1/2; S26; S28; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hexamethylene diisocyanate is a colorless liquid. Sharp, irritating odor. Molecular weight = 168.19; specific gravity (H_2O:1) = 1.05 @ 20°C; boiling point = 212.8°C; freezing/melting point = −67°C; relative vapor density (air = 1): 5.8; vapor pressure = 0.5 mmHg @ 25°C; flash point = 140°C; autoignition temperature = 454°C. Explosive limits: LEL = 0.9%; UEL: 9.5. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 1₩. Reacts with water, releasing heat and carbon dioxide.

Potential Exposure: Used to make other chemicals, coatings, and polyurethane. It is also used as a hardener in automobile and airplane paints.

Incompatibilities: May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acyl-chlorides may cause explosive polymerization. Attacks some plastics, rubber and coatings. Contact with metals may evolve flammable hydrogen gas. May accumulate static electrical charges, and may cause ignition of its vapors. Temperatures above 200°C can cause polymerization. Attacks copper.

Permissible Exposure Limits in Air

822-06-0, 1,6-diisocyanatohexane

OSHA PEL: None

NIOSH REL: 0.005 ppm/0.035 milligram per cubic meter TWA; 0.020 ppm/0.140 milligram per cubic meter [10-minutes] Ceiling Concentration ACGIH TLV[1]: 0.005 ppm/0.034 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 0.018 ppm

PAC-2: 0.2 ppm

PAC-3: 3 ppm

DFG MAK: 0.005 ppm/0.035 milligram per cubic meter TWA; Peak Limitation Category I(1), a momentary value of 0.01 mL/m^3/0.070 milligram per cubic meter should not be exceeded; Danger of sensitization of the airways and skin; Pregnancy Risk Group D

The state of Connecticut has set a guideline for hexamethylene diisocyanate in ambient air of 0.7 μ/m^{3}[60].

28182-81-2, polymer

PAC-1: 7.8 ppm

PAC-2: 86 ppm

PAC-3: 510 ppm

Determination in Air: Use NIOSH (IV), Methods, #5521, #5522,#5525; OSHA Analytical Method 42.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hexamethylene diisocyanate can affect you when breathed in and by passing through your skin. Contact can irritate and may burn the eyes and skin. Skin contact may cause skin blisters. Eye contact may cause corneal damage. Exposure can cause headache, nausea, vomiting and irritability. Just a few breaths of high levels of hydrogen sulfide in air can cause death. High levels can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Respiratory sensitization may result from high levels of exposure. LD$_{50}$ (oral, rat) = < 800 mg/kg.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy with itching and skin rash. Repeated or prolonged inhalation exposure may cause a lung allergy (asthma) to develop. Once allergy develops, future exposure can cause cough, wheezing, and shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 0.05 ppm:* Sa (APF = 10) (any supplied-air respirator).* *up to 0.125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *up to 0.25 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1 ppm:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Hexamethylene diisocyanate should be stored away from moisture or water. This contact will cause it to polymerize and explode its container. Hexamethylene diisocyanate must be stored to avoid contact with amines, carboxylic acids; strong bases and alcohols, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area at temperatures below 93°C/200°F.

Shipping: UN2281 Hexamethylene diisocyanate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. This chemical is a combustible liquid. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Hexamethylphosphoric triamide is a colorless liquid with a spicy odor. Molecular weight = 179.2; specific gravity (H_2O:1) = 1.03 @ 20°C; boiling point = 232.8°C; freezing/melting point = 7.2°C; relative vapor density (air = 1) = 6.18; vapor pressure = 0.03 mmHg @ 25°C; flash point = 104.4°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: Hexamethylphosphoric triamide is a material possessing unique properties and is widely used as a solvent in small quantities, in organic and organometallic reactions in laboratories. This is the major source of occupational exposure to HMPA in the United States. It is also used as a processing solvent in the manufacture of aramid fibers. HMPA has been evaluated for use as an ultraviolet light absorber or inhibitor in polyvinylchloride formulations; as an additive for antistatic effects; as a flame retardant; and as a deicing additive for jet fuels. Hexamethylphosphoric triamide has also been extensively investigated as an insect chemosterilant.

Incompatibilities: Incompatible (possibly violent reaction; fire and explosions) with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.). Keep away from alkaline materials, chemically active metals, strong acids, strong bases.

Permissible Exposure Limits in Air

OSHA PEL: none

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: No numerical value; [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 0.34 ppm

PAC-2: 3.7 ppm

PAC-3: 17 ppm

DFG MAK: [skin]; Pregnancy risk Group C; Carcinogen Category 2

Australia [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: [skin], carcinogen, 1993; Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: [skin], carcinogen, 1999; Switzerland: [skin], Carcinogen 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for HMPA in ambient air[60] ranging from zero (North Dakota) to 0.0024 ppb (Pennsylvania) to 0.03 μ/m^3 (New York) to 3.0 μ/m^3 (Virginia) to 14.5 μ/m^3 (South Carolina).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact. Through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Hexamethylphosphoramide can affect you when breathed in and by passing through your skin. Exposure may irritate and damage the nose, throat and lungs, causing a nasal discharge and lung changes. Very high levels may cause kidney and lung damage.

Long-Term Exposure: Potential occupational carcinogen. May cause cancer of the nose. Hexamethylphosphoramide may cause mutations. Handle with extreme caution. There is limited evidence that HEMPA may damage the testes of males and affect sperm production. Repeated exposure may severely damage the kidneys and lungs. May damage the nose, causing chronic nasal discharge.

Points of Attack: Eyes, skin, respiratory system; central nervous system; gastrointestinal tract. Cancer site in animals: nasal cavity.

Medical Surveillance: For those with frequent or potentially high exposure (or significant skin contact), the following are recommended before beginning work and at regular times after that: exam of the nose. Lung function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue *(potential human carcinogen)*: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Hexamethylphosphoramide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); strong acids (such as hydrochloric, sulfuric, and nitric); and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from area. Sources of ignition, such as smoking and open flames are prohibited where hexamethyl phosphoramide is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Decomposition products may include phosphine and oxides of nitrogen, phosphorus, and carbon. Use dry chemical or carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*n-HEXANE*): Hazard symbol: F, Xn, N; risk phrases: R11; R38; R48/20; R51/53; R62; R63; R65; R67; safety phrases: S2; S9; S16; S21; S29; S33; S36/37; S41; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (CAS: 110-54-3)

Description: *n*-Hexane is a highly flammable, colorless, volatile liquid with a gasoline-like odor. The water/odor threshold is 0.0064 mg/L and the air/odor threshold is 230−875 milligram per cubic meter. Molecular weight = 86.18; specific gravity (H_2O:1) = 0.66; boiling point = 68.7°C; freezing/melting point = −95.4°C; Relative vapor density (air = 1) = 3.0; vapor pressure = 75 mmHg @ 9.8°C; flash point = −21.6°C (cc); autoignition temperature = 225°C. Explosive limits: LEL = 1.1%, 11,000 ppm; UEL: 7.5%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Practically insoluble in water; solubility = 0.002%.

Potential Exposure: *n*-Hexane is industrial chemical, emulsifier, in manufacture of plastics, resins; as a solvent, particularly in the extraction of edible fats and oils; as a laboratory reagent; and as the liquid in low temperature thermometers. Technical and commercial grades consist of 45−85% hexane, as well as cyclopentanes, isohexane, and 1% to 6% benzene.

Incompatibilities: May form explosive mixture with air. Contact with strong oxidizers may cause fire and explosions. Contact with dinitrogen tetraoxide may explode @ 28°C. Attacks some plastics, rubber and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 1100 ppm [LEL]

Conversion factor: 1 ppm = 3.53 milligram per cubic meter @ 25°C & 1 atm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript “**A**” and correspond to 60 minute values.

DFG MAK (*n-hexane only*): 50 ppm/180 milligram per cubic meter TWA; Peak Limitation Category II(8) [skin]; Pregnancy Risk Group C; BAT: 5 mg[hexane-2,5-dione + 4,5-dihydroxy-2-hexanone]/L in urine at end-of-shift

Australia: TWA 50 ppm (180 milligram per cubic meter), 1993; Austria: MAK 50 ppm (180 milligram per cubic meter), 1999; Belgium: TWA 50 ppm (176 milligram per cubic meter), 1993; Denmark: TWA 25 ppm (90 milligram per cubic meter), 1999; Finland: TWA 50 ppm (180 milligram per cubic meter); STEL 150 ppm (530 milligram per cubic meter), 1999; France: VME 50 ppm (170 milligram per cubic meter), 1999; Hungary: TWA 100 milligram per cubic meter; STEL 200 milligram per cubic meter [skin], 1993; the Netherlands: MAC-TGG 90 milligram per cubic meter, 2003; Norway: TWA 25 ppm (90 milligram per cubic meter), 1999; the Philippines: TWA 500 ppm (1800 milligram per cubic meter), 1993; Poland: MAC (TWA) 100 milligram per cubic meter, MAC (STEL) 400 mg/me, 1999; Russia: TWA 40 ppm; STEL 300 milligram per cubic meter, 1993; Sweden: NGV 25 ppm (90 milligram per cubic meter), KTV 50 ppm (180 milligram per cubic meter), 1999; Switzerland: MAK-W 50 ppm (180 milligram per cubic meter), KZG-W 100 ppm

(360 milligram per cubic meter), 1999; Turkey: TWA 500 ppm (1800 milligram per cubic meter), 1993; United Kingdom: TWA 20 ppm (72 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 50 ppm [skin]. Russia[35,43] set a MAC in ambient air in residential areas of 60 milligram per cubic meter on a momentary basis.

Hexane, other isomers other than n-hexane

OSHA PEL: None

NIOSH REL: 100 ppm/350 milligram per cubic meter TWA; 510 ppm/1800 milligram per cubic meter [15-minutes] Ceiling Concentration

ACGIH TLV[1]: 500 ppm/1750 milligram per cubic meter TWA; 1000 ppm/3500 milligram per cubic meter STEL

all hexane isomers except n-hexane:

DFG MAK: 500 ppm/1800 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.

Determination in Air: Use NIOSH Analytical Method: for Hydrocarbons, Boiling point = 36–126°C, #1500, for Hydrocarbons, Boiling point 36–126°C; #3800; OSHA Analytical Method 7. See also NIOSH Analytical Method: Volatile organic compound, #2549

Permissible Concentration in Water: The EPA[48] has set a health advisory for *n*-hexane involving the calculation of a NOAEL of 570 mg/kg/day which results in a long-term health advisory for an adult of 14.3 mg/L. A health-based maximum contaminant level of 33 μg/L has been derived by the state of New Jersey[59] based on neurotoxic effects observed in rats exposed to *n*-hexane by inhalation. Arizona and Maine[61] have set guidelines for *n*-hexane in drinking water of 4000 μg/L.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = \sim 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation of vapor, ingestion, eye and skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, nose, and respiratory tract. Exposure can cause lightheadedness, giddiness, headaches, and nausea. High levels can lead to unconsciousness and death. *Inhalation:* Exposure to levels above 500 ppm may cause headaches, abdominal cramps; a burning feeling of the face; numbness and weakness of the fingers and toes. Levels above 1300 ppm may cause the above plus nausea and irritation of the nose and throat. Levels above 1500 ppm may cause the above plus blurred vision, loss of appetite and loss of weight. Most symptoms disappear within a few months if exposure ceases. Breathing liquid into the lungs may cause chemical pneumonia. *Skin:* Contact may cause irritation, redness, swelling, blisters and pain. Skin exposure may contribute to symptoms listed under inhalation. *Eyes:* Levels over 880 ppm may cause irritation. *Ingestion:* May contribute to symptoms listed under inhalation. Estimated lethal dose is one ounce to one pint.

Long-Term Exposure: High or repeated exposure can damage the nervous system; causing numbness, tingling, and/or muscle weakness in the hands, feet, arms and legs. Repeated skin contact can cause irritation, dryness and cracking, and can lead to rash. May cause symptoms listed under inhalation. Exposure to levels above 650 ppm for two to four months can result in weakness and numbness of the arms and legs. Symptoms go away within a few months if exposure stops. Use by older children in the United States and Europe who have "sniffed" household chemicals containing *n*-hexane in an attempt to get "high" has caused paralysis of the arms and legs. In laboratory studies, animals exposed to high levels of *n*-hexane had signs of disturbed sleep; lung damage, and damage to the sperm-forming cells.

Points of Attack: Eyes, skin, respiratory system; central nervous system; peripheral nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), during exposure, expired air, expired air, during exposure; neurologic examination/electromyography; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), end of work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol, Viton, polyurethane, Teflon, Viton/chlorobutyl rubber, Silvershield, and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* Sa (APF = 10) (any supplied-air respirator). *1100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. *n*-Hexane must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), because violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where *n*-hexane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of 5 gal or more of n-hexane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of *n*-hexane.

Shipping: UN1208 Hexanes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit.

Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 203-852-3 [*Annex I Index No.:* 603-059-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R22; safety phrases: S2; S24/25 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hexanol is a flammable, colorless liquid. Molecular weight = 102.2; specific gravity (H_2O:1) = 0.82 @ 20°C; boiling point = 157°C; freezing/melting point = −47°C; vapor pressure = 1 mmHg @ 24°C; flash point = 63°C. Explosive limits: LEL = 1.2%; 12,000 ppm; UEL: 7.7%[41]. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Slightly soluble in water.

Potential Exposure: Those using hexanol as a solvent or in the synthesis of pharmaceuticals and textile chemicals. Also used as a plasticizer intermediate, specialty; ethoxylate intermediate; and a defoamer

Incompatibilities: May form explosive mixture with air. Incompatible with strong acids; caustics, aliphatic amines; isocyanates, strong oxidizers.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 10 ppm

PAC-2: 110 ppm

PAC-3: 580 ppm [LEL = 11,000 ppm]

DFG MAK: No numerical value established. Data may be available.

Russia has set a TLV of 2.4 ppm (10 milligram per cubic meter)[43].

Determination in Air: Charcoal tube; CS2; Gas chromatography/Flame ionization detection; IV (#1500, Hydrocarbons)

Permissible Concentration in Water: A value of 0.03 mg/L is the maximum allowed in drinking water[11].

Routes of Entry: Skin contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Vapor irritates the eyes, skin and respiratory tract. Contact causes smarting of the skin and first-degree burns on short exposure; may cause second-degree burns on long exposure. Believed to be moderately toxic upon ingestion. Exposure can cause headache, dizziness, confusion; muscle weakness; nausea, vomiting, and diarrhea.

Long-Term Exposure: Repeated exposure may damage the nervous system.

Points of Attack: Skin, eyes, nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with hexanol all handlers should be trained on its proper handling and storage. Before entering confined space where hexanol may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2282 Hexanol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard, Agricultural chemical.

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R36/37/38; R50/53; safety phrases: S2; S29/35; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Hexazinone is a white crystalline solid that is practically odorless. Molecular weight = 252.36; boiling point = decomposes; freezing/melting point = 115–117°C; vapor pressure = 3.0×10^{-7} mmHg. Soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this contact and residual herbicide. It is a broad spectrum triazine herbicide is used in industrial and government right-of-way weed control for pipelines, drainage ditches, etc.[23]

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: The EPA has analyzed data on hexazinone and developed a no observed adverse-effect-level (NOAEL) of 25 mg/kg/day based on studies of dogs which resulted in a long-term health advisory of 8.75 mg/L. A NOAEL of 10 mg/kg/day was developed based on studies of rats which yielded a lifetime health advisory of 0.21 mg/L.

Determination in Water: Solvent extraction with methylene chloride followed by analysis by gas chromatography with a thermionic bead detector. Fish Tox = 24566.31408000 bbp MATC (VERY LOW). Octanol–water coefficient: $\text{Log}\,K_{\text{ow}} = -4.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive eye irritant. May skin irritation. In experience with humans, only one report was available on hexazinone. It involved a 26 year-old woman who inhaled hexazinone dust; vomiting occurred within 24 hours. LD_{50} = (oral, rat) 1690 mg/kg (slightly toxic). Human Tox = 400.00000 ppb (VERY LOW).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area above 32°C.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen

Hazard Alert: Combustible, Environmental hazard. Listed for Tier 1 screening as an endocrine disruptor[88].

List of priority pollutants (United States Environmental Protection Agency)

Clean Water Act: Toxic Pollutant (Section 401.15) other than those listed elsewhere; includes trichlorophenols

RCRA Section 261 Hazardous Constituents, waste number not listed

EPCRA Section 313 (as chlorophenols) Form R de minimis concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R45; R50/53; safety phrases: S2; S29; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: White to pale yellow crystalline solid, tan granules or powder. Odorless. Molecular weight = 352.89; boiling point = 221.5°C; freezing/melting point = 105−108°; vapor pressure = 2.3×10^{-8} mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 0, flammability 1, reactivity 0. Very slightly soluble in water; solubility = < 1 ppm.

Potential Exposure: Carboxamide acaricide, IGR, and ovacide for tetranychid mite eggs. Used on a various crops, including citrus, grapes, pome fruit, hops, strawberries, and dates.

Incompatibilities: Dust forms an explosive mixture with air. Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. Decomposes in temperatures >290°C. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Determination in Water: Octanol−water coefficient: $\text{Log } K_{ow} = 5.57$ (est)[83]. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)(101): Intermediate−62.61862 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Ingestion, absorbed through the unbroken skin.

Short-Term Exposure: Inhalation can cause severe irritation, burns to the nose and throat, headache, dizziness, vomiting, lung damage, muscle twitchings, spasms, tremors, weakness, staggering and collapse. Dermal contact may cause severe irritation and burns. Absorbed through the skin to cause or increase the severity of symptoms listed above. Eye contact causes severe irritation. May cause burns. Ingestion can cause irritation, burns to the mouth and throat, low blood pressure, profuse sweating, intense thirst, nausea, abdominal pain, stupor, vomiting, red blood cell damage and accumulation of fluid in the lungs followed by pneumonia. May also cause restlessness and increased breathing rate followed by rapidly developing muscle weakness. The substance irritates the eyes, the skin and the respiratory tract. LD_{50} (oral, dermal, rat) = > 5 g/kg; LD_{50} (dermal, rat) = > 5 g/kg.

Long-Term Exposure: Skin sensitivity may develop. A possible liver toxin. May have effects on the blood, heart, liver, lung, kidney. The state of New Jersey lists the 2-chloro-isomer as a probable carcinogen, and that it causes leukemia and soft tissue cancers in humans. Human toxicity (long term)[101]: Intermediate—17.50 ppb, Health Advisory.

Points of Attack: Central nervous system, blood, bladder, liver

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring. If symptoms develop or overexposure is suspected, the following may be useful: Liver function tests. Kidney function tests. Examination by a qualified allergist. EKG

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European

Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with carboxin all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen, sulfur and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks:* Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire:* use dry chemical, CO_2, water spray or regular *foam. On a large fire:* use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks:* From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

1-Hexene H:0330

Formula: C_6H_{12}; $CH_3(CH_2)_3CH{=}CH_2$

Synonyms: Butyl ethylene; Butylethylene; 1-*n*-Hexene; 1-Hexene; Hexylene

CAS Registry Number: 592-41-6

HSDB Number: 1079

RTECS Number: MP6601000

UN/NA & ERG Number: UN2370/128

EC Number: 209-753-1

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Environmental hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R51/53; R65; R67; safety phrases: S9; S16; S21; S23; S29; S33; S45; S57; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Hexene is a colorless liquid. Molecular weight = 84.16; specific gravity (H_2O:1) = 0.67 @ 20°C; boiling point = 65°C; freezing/melting point = −140°C; vapor pressure = 310 mmHg @ 38°C; flash point = −7°C;

autoignition temperature = 253°C. Explosive Limits: LEL = 1.2%, 12,000 ppm; UEL: 6.9%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in its use in organic synthesis. Used in fuels, and to make flavors, perfumes, dyes, and plastic resins.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May react exothermically with reducing agents, releasing flammable hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: None

ACGIH TLV[1]: 50 ppm/172 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: 150 ppm

PAC-2: $\mathbf{500_E}$ ppm

PAC-3: $\mathbf{5000_E}$ ppm (Warning: LEL = 12,000 ppm)

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Irritating to skin, eyes and respiratory tract causing coughing and wheezing. Death may occur. Ingestion may cause chemical pneumonitis. Exposure may affect the central nervous system. Exposure can cause headache, nausea, dizziness, and unconsciousness.

Long-Term Exposure: Removes the skin's natural oils, causing dryness and cracking.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Use organic vapor respirator or airline Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. mask. Wear protective goggles or face shield.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with hexene all handlers should be trained on its proper handling and storage. Before entering confined space where hexene may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN23701-Hexene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Avoid contact with liquid or vapor. Stay upwind and use water spray to "knock down" vapor. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil skimming equipment and sorbent (urethane) foams may be used for spills on water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of

carbon. Water may be ineffective. Use alcohol or polymer foam, dry chemical, or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: *sec*-Hexyl acetate is a colorless liquid with a mild, pleasant, fruity odor. Molecular weight = 144.24; specific gravity (H_2O:1) = 0.86; boiling point = 147.2°C; freezing/melting point = −63.8°C; Relative vapor density (air = 1) = 5.0; vapor pressure = 3 mmHg; flash point = 35°C; autoignition temperature = 266°C. Explosive limits: LEL = 0.9%; UEL: 5.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 2, reactivity 0. Insoluble in water.

Potential Exposure: This material is used as a solvent in the spray lacquer industry. It is a good solvent for cellulose esters and other resins.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Conversion factor: 1 ppm = 5.90 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 50 ppm/300 milligram per cubic meter TWA

NIOSH REL: 50 ppm/300 milligram per cubic meter TWA

ACGIH TLV[1]: 50 ppm/295 milligram per cubic meter TWA PAC not available.

Australia: TWA 50 ppm (300 milligram per cubic meter), 1993; Austria: MAK 50 ppm (300 milligram per cubic meter), 1999; Belgium: TWA 50 ppm (295 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (300 milligram per cubic meter), 1999; Finland: TWA 50 ppm (300 milligram per cubic meter); STEL 75 ppm (450 milligram per cubic meter), 1999; France: VME 50 ppm (300 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 300 milligram per cubic meter, 2003; the Philippines: TWA 50 ppm (300 milligram per cubic meter), 1993; Switzerland: MAK-W 50 ppm (300 milligram per cubic meter), KZG-W 100 ppm (600 milligram per cubic meter), 1999; Turkey: TWA 50 ppm (300 milligram per cubic meter), 1993; United Kingdom: TWA 50 ppm (299 milligram per cubic meter); STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: 50 ppm TWA. Several states have set guidelines and standards for *sec*-hexyl acetate in ambient air[60] ranging from 3.0 milligram per cubic meter (North Dakota) to 6.0 milligram per cubic meter (Connecticut) to 7.143 milligram per cubic meter (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, gas chromatography/flame ionization. Use NIOSH Analytical Method 1450 for Esters; OSHA Analytical Method 7[18].

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes and respiratory tract. May affect the central nervous system causing headache, dizziness, nausea, narcosis.

Long-Term Exposure: May cause skin drying and cracking.***Points of Attack:*** Eyes, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: *up to 500 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or Sa* (APF = 10) (any supplied-air respirator); SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:*
SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).
*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with hexyl acetate all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1233 Methylamyl acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Oil skimming equipment may be used to remove slicks from water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Water may be ineffective. Use alcohol foam, CO_2 or dry chemical extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R36/38; safety phrases: S2; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hexylene glycol is a colorless liquid with a mild, sweet odor. The odor threshold is 50 ppm. Molecular weight = 118.2; specific gravity (H_2O:1) = 0.92; boiling point = 197 °C; freezing/melting point = −50°C (sets to glass); vapor pressure = 0.05 mmHg @ 20°C; flash point = 93.3°C; autoignition temperature = 260°C; 306°C. Explosive limits: LEL = 1.3%; UEL: 7.4%[41]. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: Hexylene glycol is used in metal working fluids; the formulation of hydraulic brake fluids; in making printing inks. It is used as a fuel and lubricant additive; as an emulsifying agent; and as a cement additive.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Incompatible with caustics, aliphatic amines; isocyanates. Hygroscopic (i.e., absorbs moisture from the air).

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.83 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 25 ppm/125 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 25 ppm/121 milligram per cubic meter Ceiling Concentration

PAC Ver. 29[138]

PAC-1: 2.3 ppm

PAC-2: 25 ppm

PAC-3: 150 ppm

DFG MAK: 10 ppm/49 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group D

Australia: TWA 25 ppm (125 milligram per cubic meter), 1993; Belgium: STEL 25 ppm (121 milligram per cubic meter), 1993; Denmark: TWA 25 ppm (125 milligram per cubic meter), 1999; Finland: TWA 25 ppm (125 milligram per cubic meter); STEL 40 ppm (190 milligram per cubic meter), 1993; France: VLE 25 ppm (125 milligram per cubic meter), 1999; Norway: TWA 20 ppm (100 milligram per cubic meter), 1999; Switzerland: MAK-W 25 ppm, 1999; the Netherlands: MAC 125 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 25 ppm. States which have set guidelines or standards for hexylene glycol in ambient air[60] include 1.25 milligram per cubic meter (North Dakota) and 2.976 milligram per cubic meter (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2101

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.6. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact can irritate and may burn the eyes and skin. Exposure may affect the central nervous system. Eye and throat irritation and respiratory discomfort were slight upon exposure to 100 ppm, but more pronounced @ 1000 ppm. Ingestion produces central nervous system depression. High exposure can cause dizziness, loss of coordination; and unconsciousness. Extremely high exposures can cause coma and kidney damage. Toxicity by Ingestion: Grade 2; LD_{50} = 0.5 to 5 g/kg[136].

Long-Term Exposure: Repeated exposure may cause dry skin, rash, sensitization and allergy. May damage the kidney and liver, and may affect the nervous system. Many similar petroleum-based solvents have been shown to cause brain and nerve damage.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Evaluation by a qualified allergist. Evaluate for brain effects and refer positive and borderline individuals for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 25 ppm*; Use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containersin a cool, well-ventilated area away from oxidizers (such as peroxides, perchlorates, chlorates, permanganates, and nitrates). Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Hexylene glycol is not cited in DOT'S Performance-Oriented Packaging Standards[19].

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Hexyl Trichlorosilane H:0360

Formula: $C_6H_{13}Cl_3Si$; $C_6H_{13}SiCl_3$

Synonyms: Silane, trichlorohexyl-; Trichlorohexylsilane

CAS Registry Number: 928-65-4

HSDB Number: 2005
RTECS Number: VV4320000
UN/NA & ERG Number: UN1784/156
EC Number: 213-178-1

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Flammable, Poison, Corrosive, Violently water reactive

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn; risk phrases: R10; R14; R36/37/38; R34; R40; safety phrases: S1; S22; S26; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hexyl trichlorosilane is a colorless liquid that fumes in moist air. Molecular weight = 219.63; specific gravity (H_2O:1) = 1.1 @ 20°C; boiling point = 190°C; flash point = 85°C. Explosive limits: LEL = 10,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 2₩. Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: Used in the manufacture of other silicon chemicals.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]
PAC-1: $\mathbf{0.6_A}$ ppm
PAC-2: $\mathbf{7.3_A}$ ppm
PAC-3: $\mathbf{33_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Hexyl trichlorosilane can affect you when breathed in. Hexyl trichlorosilane is a corrosive chemical and can cause severe skin and eye burns leading to permanent eye damage. Exposure can severely irritate the respiratory tract causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Highly irritating substances can cause lung irritation and bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to hexyl trichlorosilane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location.

(2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and steam. Hexyl trichlorosilane can give off corrosive hydrogen chloride gas on contact with water, steam or moisture. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1784 Hexyl trichlorosilane, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

Hexyl trichlorosilane when spilled in water

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.9/1.5

Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors−contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride and oxides if metal and carbon. *Do not use water, as poisonous and corrosive gases will be released. FOR CHLOROSILANES DO NOT USE WATER. USE AFFF ALCOHOL-RESISTANT, MEDIUM EXPANSION FOAM. Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers.* If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Hydramethylnon H:0365

Formula: $C_{25}H_{24}F_6N_4$

Synonyms: AC-217300; AI3-29349; Amdro; Amidinohydrazone; Ant killer granular bait; Caswell No. 839A; Caswell No. 642AB; CL 217,300; Combat; Matox; Maxforce; 1,4-Pentadien-3-one-1,5-bis(α,α,α-trifluoro-*p*-tolyl)-tetrahydro-5,5-dimethyl-2(1*H*)-pyrimidinylidene)hydrazone; Pyrimidinone; 2(1*H*)-Pyrimidinone, tetrahydro-5,5-dimethyl-, [3-(4-(trifluoromethyl)phenyl]-1-[2-(4-(trifluoromethyl)phenyl] ethenyl-2-propenylidene]hydrazone; Roach gel sensible; Siege; Tetrahydro-5,5-dimethyl-2(1*H*)-

pyrimidinone[1,5-bis(α,α,α-trifluoro-*p*-tolyl)-1,4-pentadien-3-one]hydrazone; Tetrahydro-5,5-dimethyl-2(1*H*)-pyrimidinone[3-(4-(trifluoromethyl)phenyl)]-1-[2-(4-(trifluoromethyl) phenyl)ethenyl]-2-propenylidene] hydrazone; Wipeout

CAS Number: 67485-29-4

HSDB Number: 6673

RTECS Number: UW7583000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 405-090-9 [*Annex I Index No.:* 613-181-00-1]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen (2006)

California Proposition 65 Chemical[102]: Developmental/ Reproductive toxin (male) (3/5/1999)

Hazard Alert: Endocrine disruptor, Suspected reprotoxic hazard, Environmental hazard, Agricultural chemical.

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R40; R22; R29/35; R36; R48/25; R50/53; R62; R63; safety phrases: S1/2; S22; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Dark yellow to tan crystalline solid, granules, or powder. Commercial products are available in various forms. Characteristic vegetable oil odor. Molecular weight = 494.475; specific gravity (H_2O:1) = 1.68 @ 25°C; freezing/melting point = 190°C; vapor pressure = 2.3×10^{-8} mmHg; flash point = 94°C (cc); Henry's Law constant = 2.20×10^{-6} atm m^3/mol @ 25°C (est)[83]. Practically insoluble in water; solubility = 0.005 mg/L @ 25°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Hydramethylnon is a slow-acting organofluorine insecticide used primarily to control ants in grasses and on rangelands, as well as on other noncrop lands such as lawns, turf, and nonbearing nursery stock. Hydramethylnon is also registered for the control of household ant species and cockroaches in nonfood use areas in and around domestic dwellings and commercial establishments. Hydramethylnon has established tolerances from use on grasses in pastures and rangeland; however hydramethylnon is almost completely metabolized within the body of ruminants and there are no detectable residues in meat, milk, or meat-by-products. Therefore, tolerances are not required for these commodities even though hydramethylnon is considered a food-use pesticide for the purposes of reregistration and tolerance reassessment.

Determination in Water: Octanol−water coefficient: Log K_{ow} = < 2.5. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: High—8.90567 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air purifying respirators for pesticides. Toxic if inhaled, ingested, or absorbed through the skin. LD_{50} (oral, rat) = 1200 mg/kg; LD_{50} (dermal, rabbit) = > 5 g/kg.

Long-Term Exposure: A male reproductive toxin. Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. Human toxicity (long term)[101]: Extra high—0.21 ppb, Health Advisory.

Points of Attack: Testes, reproductive system, bones.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring. Comprehensive physical examination with emphasis on the genito-urinary tract including testicle size and consistency in males. Semen analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum FSH, and serum LH may be carried out if, in the opinion of a physician, they are indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear (minimum EN 166 or equivalent); Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/ Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the Worker Protection Standard. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable* *concentration:* SCBAF:Pd,Pp (APF = 10,000): (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen fluoride, fluorine and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol-resistant foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States EPA guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water. (*hydrazine and hydrate*)

Description: Hydrazine is a colorless, oily liquid. Ammoniacal odor. The hydrate is a 64% solution in water. Molecular weight = 32.05; specific gravity (H_2O:1) = 1.01 @ 20°C; boiling point = 119°C; freezing/melting point = −51.7°C; relative vapor density (air = 1) = 1.1; vapor pressure = 14.4 mmHg @ 25°C; flash point = 38°C (cc); autoignition temperature = from 24°C (on a rusty iron surface) to 270°C (on a glass surfaces). Explosive limits: LEL = 2.9%; UEL: 98%[17]. Hazard Identification (based on NFPA-704 M Rating System) (*anhydrous*): Health 4, flammability 4, reactivity 3. Soluble in water; hygroscopic. *Hydrate:* Molecular weight = 50.08; specific gravity (H_2O:1) = 1.03 @ 20°C; boiling point = 113.6°C; freezing/melting point = 1.5°C.

Potential Exposure: Because of its strong reducing capabilities, hydrazine is used as an intermediate in chemical synthesis, and in photography and metallurgy. It is also used as a rocket fuel; in the preparation of anticorrosives; textile agents; pesticides; and as a scavenging agent for oxygen in boiler water. Hydrazine is widely used in pharmaceutical synthesis.

Incompatibilities: Vapor may form explosive mixture with air. A highly reactive reducing agent and a medium strong base. May ignite *spontaneously* on contact with oxidizers or porous materials, such as earth, rust, wood and cloth. Air or oxygen is not required for decomposition. Oxidizers, hydrogen peroxide; nitric acid; metallic oxides; acids, halogens can cause fire and explosions. Attacks cork, glass, some plastics; rubber and coatings. The aqueous solution is highly alkaline; keep away from acids.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 ppm

Odor Threshold = 3.7 ppm

Conversion factor: 1 ppm = 1.31 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm/1.3 milligram per cubic meter TWA [skin]

NIOSH REL: 0.03 ppm/0.04 milligram per cubic meter [120-minutes] Ceiling Concentration; A potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV[1]: 0.01 ppm/0.013 milligram per cubic meter [skin]; confirmed animal carcinogen with unknown relevance to humans PAC* Ver. 29[138]

302-01-2, anhydrous

PAC-1: 0.10 ppm

PAC-2: $\mathbf{13}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{35}_{\mathbf{A}}$ ppm

7803-57-8, hydrate

PAC-1: 0.16 ppm

PAC-2: 20 ppm

PAC-3: 55 ppm

DFG MAK; [skin] danger of skin sensitization; Carcinogen Category 2; TRK: [skin]; danger of skin sensitization; Sampling time: end of exposure or end-of-shift; 380 μg [creatinine]/L urine hydrazine; 340 μg/L plasma hydrazine.

Australia: TWA 0.1 ppm (0.1 milligram per cubic meter) [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Denmark: TWA 0.1 ppm (0.13 milligram per cubic meter) [skin], 1999; Finland: TWA 0.1 ppm; STEL 0.3 ppm [skin], carcinogen, 1999; Japan: 0.01 ppm (0.013 milligram per cubic meter) [skin], 1999; Norway: TWA 0.1 ppm (0.13 milligram per cubic meter), 1999; the Philippines: TWA 1 ppm (1.3 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 0.05 milligram per cubic meter, MAC (STEL) 0.1 milligram per cubic meter, 1999; Russia: STEL 0.1 milligram per cubic meter [skin], 1993; Sweden: NGV 0.1 ppm, KTV 0.3 ppm [skin], carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (0.13 milligram per cubic meter) [skin], carcinogen, 1999; Turkey: TWA 1 ppm (1.3 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 0.03 milligram per cubic meter; STEL 0.13 milligram per cubic meter [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic:[35] MAC 0.05 milligram per cubic meter. Several states have set guidelines or standards for hydrazine in ambient air[60] ranging from zero (North Carolina and North Dakota) to 0.003 μ/m^3 (Rhode Island) to 0.018 milligram per cubic meter (Massachusetts) to 0.24 μ/m^3 (Pennsylvania) to 0.33 μ/m^3 (New York) to 0.5 μ/m^3 (South Carolina) to 1.0 μ/m^3 (Connecticut, Florida and Virginia) to 2.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #3503 for hydrazine[18]; OSHA Analytical Method 20 or 108[58].

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 18 μg/L based on health effects. Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.01 mg/L (10 μg/L).

Determination in Water: Octanol−water coefficient: $\text{Log}\,K_{\text{ow}} = -3.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hydrazine is corrosive to the eyes, skin, and respiratory tract. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the liver, kidneys, and central nervous system. Exposure may result in death. The effects may be delayed. Signs and symptoms of acute exposure to hydrazine may include severe eye irritation; facial numbness; facial swelling; and increased salivation. Hydrazine vapor may immediately irritate the nose and throat. Headache, twitching, seizures, convulsions, and coma may also occur. Gastrointestinal signs and symptoms include anorexia, nausea, and vomiting. Pulmonary edema and hypotension (low blood pressure) are common. Hydrazine is toxic to the liver, ruptures red blood cells, and may cause kidney damage. Dermal contact may result in irritation or severe burns. Target organs affected include central nervous system; respiratory system; skin and eyes. Chronic exposure in humans may cause pneumonia, liver and kidney damage. Liver damage may be more severe than kidney damage. It is a suspected human carcinogen.

Long-Term Exposure: Repeated or prolonged contact may cause sensitization and skin allergy. Hydrazine may affect the liver, kidneys, and central nervous system. A probable carcinogen in humans. Can irritate the lungs and may cause bronchitis. Can damage the nervous system causing weakness, shaking, and loss of balance and coordination. Exposure can cause blood damage and may cause anemia.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys. Cancer site in animals: tumors of the lungs, liver, blood vessels and intestine.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 second). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: CBC. Liver and kidney function tests. Lung function tests. Exam of the nervous system. If symptoms develop or overexposure is suspected, the following may also be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Consider pyridoxine (25 mg/kg), which has been shown to be an effective anticonvulsant for hydrazine poisoning.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. nitrile, Silvershield, PVC, Neoprene, and butyl rubber are among the recommended protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd, Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (2) Color code—Red Stripe (*hydrazine and hydrazine hydrate*): Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Flammable liquid: Store in a fireproof location. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where hydrazine may be present, check to make sure that an explosive concentration does not exist. Hydrazine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); strong acids (such as hydrochloric, sulfuric and nitric); hydrogen peroxide and metal oxides; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where hydrazine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever hydrazine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2029 Hydrazine, anhydrous or hydrazine aqueous solutions with >64% hydrazine, by mass, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid, 6.1-Poisonous materia. UN2030 Hydrazine hydrate or hydrazine aqueous solutions, with not <37% but not> 64% hydrazine, by mass, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Stay up wind; keep out of low areas. In case of contact with material, immediately flush skin or eyes with running water for at least 15 minutes. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include ammonia fumes and oxides of nitrogen and carbon. *Small fires:* dry chemical, carbon dioxide; water spray or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and protective clothing. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Move container from fire area if you can do so without risk. Dike fire control water for later disposal, do not scatter material. Spray cooling water on containers that are exposed to flames until well after fire is out. It is a flammable/combustible material and may be ignited by heat, sparks, or flames. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with facilities for effluent scrubbing to abate any nitrogen compounds formed in the combustion process[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hydrazine Sulphate H:0380

Formula: $H_4N_2 \cdot H_2O_4S$
Synonyms: HS; Hydrazine hydrogen; Hydrazine monosulfate; Hydrazine sulphate; Hydrazinium sulfate; Hydrazonium sulfate; NSC-150014
CAS Registry Number: 10034-93-2; *(alt)* 1184-66-3
HSDB Number: 5086
RTECS Number: MV9625000
UN/NA & ERG Number: UN2923/154; UN3260 (Corrosive solid, acidic, inorganic, n.o.s.)/154
EC Number: 233-110-4

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Combustible solid, Poison, Corrosive, Strong reducing agent. Possible risk of forming tumors, Suspected of causing genetic defects, Environmental hazard, Drug.

United States National Primary Drinking Water Regulations: SMCL = 250 mg[SO_4^{-2}]/L as sulphate

EPCRA Section 313 Form R de minimis concentration reporting level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xi; risk phrases: R45; R23/24/25; R50/53; R61; R62; safety phrases: S29/35; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hydrazine sulfate is a white or colorless, crystalline powder. Molecular weight = 130.1; specific gravity (H_2O:1) = 1.4 @ 20°C; freezing/melting point = 254°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 1. Soluble in water.

Potential Exposure: Used in analysis and refining of minerals, rare metals; determination of arsenic in metals, as a catalyst and antioxidant; and in fungicides, germicides and blood tests. Used as a catalyst for making acetate fibers.

Incompatibilities: Aqueous hydrazine sulfate is acidic. It is a strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

NIOSH REL: [for hydrazines] 0.03 ppm/0.04 milligram per cubic meter 2-hour Ceiling Concentration

PAC Ver. 29[138]
PAC-1: 0.5 milligram per cubic meter
PAC-2: 25 milligram per cubic meter
PAC-3: 120 milligram per cubic meter

Determination in Air: Use OSHA Analytical Method #20 or NIOSH Analytical Method #3503, Hydrazine.

Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Highly corrosive. Irritates and burns the eyes, skin, and respiratory tract. Exposure can affect the brain and nervous system; causing dizziness and lightheadedness at first, followed by trembling and convulsions. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours.

Long-Term Exposure: Hydrazine sulfate has been shown to cause liver and lung cancers in animals. Exposure can damage the liver and kidneys. Repeated exposure can damage blood cells, causing a low blood count (anemia). It can also cause methemoglobinemia with fatigue, shortness of breath; and even a bluish color to the nose, finger tips and lips. May cause skin allergy to develop.

Points of Attack: Liver, kidneys, blood, central nervous system; skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Liver and kidney function tests. CBC. Examination of the nervous system. Blood methemoglobin level. Evaluation by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine. Pyridoxine (25 mg/kg) is an effective anticonvulsant for hydrazine poisoning.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, bases.

Shipping: UN3260 Corrosive solid, acidic, inorganic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN2923 Corrosive solids, toxic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hydrazoic Acid H:0390

Formula: HN_3

Synonyms: Azoimide; Diazoimide; Hydrogen azide; Hydronitric acid; Stickstoffwasserstoffsaeure (German); Triazoic acid

CAS Registry Number: 7782-79-8

HSDB Number: 7858

RTECS Number: MW2800000

UN/NA & ERG Number: UN0473 (Explosive)/112

EC Number: 231-965-8

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Highly toxic gas; Unstable, sensitive explosive when dry. *Note*: Must be handled by an expert.

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

Hazard symbols, risk, & safety statements: Hazard symbol: E, T+; risk phrases: R1; R2; R26/27/28; R44; safety phrases: S41 (see Appendix 4)

Description: The pure and concentrated material is highly unstable and potentially explosive. This material should be handled only by experts. Hydrazoic acid is a colorless, volatile liquid. Intolerable, pungent odor. Molecular weight = 43.03; boiling point = 37°C; freezing/melting point = −80°C. Highly soluble in water.

Potential Exposure: May be used in organic synthesis. Used in making heavy metal azide detonators for explosives. Requires expert handling.

Incompatibilities: Explosive when concentrated, dry or pure. A highly sensitive explosive hazard when subject to shock/impact, exposed to heat, friction, oxidizers. Very dangerous above the boiling point (37°C/98.6°F). Forms unstable and possibly explosive, heavy metal azide compounds with heavy metals. Forms explosive salts with carbon disulfide. Violent reaction with, cadmium, copper, nickel, nitric acid; fluorine.

Permissible Exposure Limits in Air
No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.
DFG MAK: 0.1 ppm/0.18 milligram per cubic meter TWA; Peak Limitation Category I(2)

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritating to skin, eyes and respiratory tract. The odor may cause violent headaches in some people. Continued inhalation causes, cough, headache, dizziness, weakness, fall in blood pressure; chills and fever and collapse. Prolonged exposure to high concentration can cause fatal convulsions and death. Highly toxic. LD_{LO} (rat, inhalation) = 1100 ppm/1H.

Long-Term Exposure: Chronic exposure can affect the central nervous system; hypotension, palpitation, ataxia, and weakness.

Points of Attack: Central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: *Unstable and unpredictable explosive material.* Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Protect from heat and shock.

Shipping: UN0473 Substances, explosive, n.o.s., Hazard Class: 1.1A; Labels: 1.1A-Explosive (with a mass explosion hazard); A-Substances which are expected to mass detonate very soon after fire reaches them, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a dangerously explosive material and highly poisonous. Thermal decomposition products may include oxides of nitrogen. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be destroyed by converting hydrazoic acid to sodium azide and the reaction mixture decomposed with nitrous acid (National Research Council, 1983).

Hydriodic Acid H:0395

Formula: HI
Synonyms: Hydriodic acid solution; Hydrogen iodide
CAS Registry Number: 10034-85-2
HSDB Number: 2155 as hydrogen iodide
RTECS Number: MW3760000
UN/NA & ERG Number: UN1787 (solution)/154; UN2197 (anhydrous)/125
EC Number: 233-109-9 [*Annex I Index No.:* 053-002-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

List 1, DEA chemical code 6695 (Title 21 CFR1310.02)

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R5; R21; R35; safety phrases: S1/2; S9; S26; S33; S36/37/39; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 500 (≥95.33% concentration)

Description: Hydriodic acid is colorless when freshly made but rapidly turns yellowish or brown on exposure to light or air. Aqueous solution of hydrogen iodide, which is a gas (anhydrous) at room temperature. Molecular weight = 127.91; specific gravity (H_2O:1) = 5.7 @ 20°C; boiling point = −35.4°C; freezing/melting point = −51°C; vapor pressure = 5940 mmHg @ 25°C; Relative vapor density (air = 1) = 4.42. Hazard identification (based on NFPA-704 M Rating System) (*50% solution*): Health 3, flammability 0, reactivity 1. Soluble in water.

Potential Exposure: Hydriodic acid is used as a disinfectant, analytical reagent; raw material for pharmaceuticals and to make iodine salts.

Incompatibilities: Contact with water forms toxic and corrosive fumes. A strong reducing agent. Violent actions with strong acids; chemically active metals; magnesium, phosphorus, perchloric acid; strong oxidizers. Explodes on contact with ethyl hydroperoxide. Protect from moisture, heat and shock.

Permissible Exposure Limits in Air

As iodides

ACGIH TLV[1]: 0.01 ppm/0.1 milligram per cubic meter, inhalable fraction and vapor, TWA

PAC* Ver. 29[138]
PAC-1: $\mathbf{1.0}_\mathbf{A}$ ppm
PAC-2: $\mathbf{25}_\mathbf{A}$ ppm
PAC-3: $\mathbf{120}_\mathbf{A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minutes values.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to skin, eyes and mucous membranes. Skin or eye contact can cause severe burns and permanent damage. Inhalation causes, cough, headache, fall in blood pressure, chills and fever and collapse; irritation of the nose and throat and can cause spasms of the windpipe which can be fatal. High concentration can cause fatal convulsions. A Japanese source[24] states that HI is painful at 0.15−0.2 ppm; intolerable at 0.3 ppm.

Long-Term Exposure: Chronic exposure can cause injury to kidneys and spleen; hypotension, palpitation, ataxia and weakness. Very irritating substances may cause lung damage. Prolonged absorption of iodides can cause skin rash, headache, irritation of mucous membranes with running nose.

Points of Attack: Lungs, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests, chest X-ray following acute overexposure, kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to hydriodic acid exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. UN2197 Poisonous gas: (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. UN1787 (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (3) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Hydriodic acid must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric); chemically active metals (such as potassium, sodium, magnesium and zinc), and strong oxidizers (such as chlorine, bromine and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. Protect storage containers from physical damage. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1787 Hydriodic acid, Hazard Class: 8; Labels: 8-Corrosive material. UN2197 Hydrogen iodide, anhydrous Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone C. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances: UN2197 Hydrogen iodide

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.6/0.9
Night 1.7/2.7

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Neutralize with chemically basic substances, such as sodium bicarbonate, soda ash; or slaked lime. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include iodine. Use water on fires in which hydriodic acid is involved. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Add slowly to a large amount of soda ash and slaked lime in solution with stirring. Flush resulting solution to a sewer[24].

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Hydriodic Acid, Trenton, NJ (June 2001).

Hydrogen H:0400

Formula: H_2

Synonyms: Hidrogeno (Spanish); Para Hydrogen; Hydrogen, compressed; Hydrogen, refrigerated liquid; Liquid hydrogen

CAS Registry Number: 1333-74-0
HSDB Number: 5026
RTECS Number: MW8900000
UN/NA & ERG Number: UN1049 (Hydrogen, compressed)/115; UN1966 (Hydrogen, refrigerated liquid)/115
EC Number: 215-605-7 [*Annex I Index No.:* 001-001-00-9]
Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Highly Reactive Substance and Explosive, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated,

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R5; R12; R21; safety phrases: S1; S9; S16; S33; S38 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Hydrogen is a highly flammable, colorless liquid or gas. Molecular weight = 2.02; specific gravity (H_2O:1) = 0.07 @ −253°C; boiling point = −253°C; vapor pressure = −259.2 mmHg @ 25°C; vapor pressure = 1.24×10^6 mmHg @ 25°C; Autoignition temperature: 500−571°C. Explosive limits: LEL = 4.0%; UEL: 75%. Hazard identification (based on NFPA-704 M Rating System): Health 0, flammability 4, reactivity 0. Slightly soluble in water.

Potential Exposure: Hydrogen is used as a fuel in weeding, as a raw material for ammonia manufacture and in organic hydrogenation reactions.

Incompatibilities: Vapors may form explosive or combustible mixture with air over a wide range of concentrations. Heating may cause violent reaction, combustion or explosion. Ignites easily with oxygen. Violent reaction with strong oxidizers, halogens, acetylene, bromine, chlorine, fluorine, nitrous oxide and other gases; metal catalysts e.g., platinum and nickel) greatly enhance these reactions. Mild steel and most iron alloys become brittle at liquid hydrogen temperatures.

Permissible Exposure Limits in Air

ACGIH TLV[1]: simple asphyxiant Note: The health effects caused by exposure to hydrogen are much less serious than its fire and explosion risk.

PAC Ver. 29[138]
PAC-1: 65,000 ppm
PAC-2: 230,000 (2.30E + 05) ppm
PAC-3: 400,000 (4.00E + 05) ppm

Hydrogen is classed as a simple asphyxiant. Large amounts of hydrogen will decrease the amount of available oxygen. Oxygen content should be tested to ensure that it is at least 19% by volume in confined spaces.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure to high levels can cause suffocation from lack of oxygen. Contact with liquid hydrogen can cause severe burns and frostbite.

Medical Surveillance: There are not special tests.

First Aid: *Contact With Liquid Hydrogen:* Put affected part into warm water. Seek medical attention. *Breathing:* Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: *Clothing:* Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn.

Respirator Selection: Exposure to hydrogen is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Hydrogen must be stored to avoid contact with heat, flames, sparks, and oxygen. Sources of ignition, such as smoking and open flames are prohibited where hydrogen is used, handled, or stored. Metal containers involving the transfer of 5 gal or more of hydrogen should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of hydrogen. Wherever hydrogen is used, handled, manufactured or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1049 Hydrogen, compressed, Hazard Class: 2.1; Labels: 2.1-Flammable gas; UN1966 Hydrogen, refrigerated liquid (cryogenic liquid) Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If hydrogen gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If liquid hydrogen is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stop the leak or move the container to a safe area and allow the liquid to evaporate. Keep hydrogen out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations.

Fire Extinguishing: If spill has not ignited, use water spray to direct flammable gas-air mixtures away from sources of ignition. If it is desirable to evaporate a spill quickly, water spray may be used to increase the rate of evaporation, if the increased vapor evolution can be controlled. Do not discharge solid streams into liquid. Because of danger of reignition, hydrogen fires normally should not be extinguished until the supply of hydrogen has been shut off. If liquid hydrogen has ignited, use water to keep fire-exposed containers cool and to protect workers stopping the source of a spill. If it is necessary to extinguish small hydrogen fires, use dry chemical, carbon dioxide; or halogenated extinguishing agent. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Combustion.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet:* Hydrogen, Trenton, NJ (August 2002)

Hydrogenated Terphenyls H:0410

Formula: $(C_6H_n)_3$; $C_6H_{11}-C_6H_4-C_6H_5$

Synonyms: Hydrogenated diphenylbenzenes; Hydrogenated phenylbiphenyls; Hydrogenated triphenyls

CAS Registry Number: 61788-32-7

HSDB Number: 2537 as M-terphenyl (92-06-8, $C_{18}H_{14}$)

RTECS Number: WZ6535000

EC Number: 262-967-7

Regulatory Authority and Advisory Information.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hydrogenated terphenyls, are a complex mixture of partially hydrogenated terphenyl isomers. They are clear, oily, pale-yellow liquids with a faint odor. Molecular weight = 241.00; 298.00 (40% hydrogenated); specific gravity (H_2O:1) = 1.01; boiling point = 340°C (40% hydrogenated); freezing/melting point = 148°C (40% hydrogenated); vapor pressure = 13 Pa @ 25°C; flash point = 157°C (cc); autoignition temperature = 374°C. Insoluble in water.

Potential Exposure: These materials are used as high temperature heat transfer media and as plasticizers.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. When heated, irritating vapors will be released.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 12.19 milligram per cubic meter (40% hydrogenated) @ 25°C & 1 atm.

OSHA PEL: None

NIOSH REL: 0.5 ppm/5 milligram per cubic meter TWA

ACGIH TLV[1]: 0.5 ppm/4.9 milligram per cubic meter (nonirradiated) TWA PAC Ver. 29[138]

PAC-1: 1.5 ppm

PAC-2: 47 ppm

PAC-3: 280 ppm

Australia: TWA 0.5 ppm (5 milligram per cubic meter), 1993; Belgium: TWA 0.5 ppm (4.9 milligram per cubic meter), 1993; Denmark: TWA 0.4 ppm (4.4 milligram per cubic meter), 1999; France: VME 0.5 ppm (5 milligram per cubic meter), 1999; Russia: STEL 5 milligram per cubic meter, 1993; Switzerland: MAK-W 0.5 ppm (5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 ppm. States which have set guidelines or standards for hydrogenated terphenyls in ambient air include Virginia @ 80.0 μ/m^3, Connecticut @ 100.0 μ/m^3, and Nevada @ 119.0 μ/m^3[60].

Determination in Air: No method available.

Routes of Entry: Dermal contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates eyes, skin, respiratory system. Potential acute hazards consist of damage to the lungs and damage to the skin and eyes from burns from the hot coolant.

Long-Term Exposure: Potential chronic hazards comprise damage to liver, kidney and blood-forming organs with the possibility of induction of metabolic disorders and cancer[53].

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, hemato system. Slightly toxic.

Medical Surveillance: Liver and kidney function tests. CBC. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Irritating vapors. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hydrogen Bromide H:0420

Formula: HBr

Synonyms: Acide bromhydrique (French); Anhydrous hydrobromic acid; Bromwasserstoff (German); HBr; Hydrobromic acid; Hydrobromic acid, anhydrous; Hydrogen bromide, anhydrous

CAS Registry Number: 10035-10-6

HSDB Number: 570

RTECS Number: MW3850000

UN/NA & ERG Number: (PIH) UN1048 (anhydrous)/125; UN1788 (hydrobromic acid solution)/154

EC Number: 233-113-0 [*Annex I Index No.*: 035-002-00-0]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 500 (≥95.33% concentration).

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Corrosive gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C; risk phrases: R5; R21; R35; R37; safety phrases: S1/2; S7/9; S26; S33; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hydrogen bromide is a corrosive colorless gas. Sharp, irritating odor. Shipped as a liquefied compressed gas. Often used in an aqueous solution. The odor threshold is 2−6.6 ppm. Molecular weight = 80.92; specific gravity (H_2O:1) = 3.5 @ 20°C; boiling point = −67°C (anhydrous); freezing/melting point = −87°C (anhydrous); relative vapor density (air = 1) = 2.81; vapor pressure = 760 mmHg @ −67°C. Soluble in water; solubility = 49%. A constant boiling dihydrate melts at −11°C and boils @ 126°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 2.

Potential Exposure: Hydrogen bromide gas and its aqueous solutions are used in the manufacture of organic and inorganic bromides; as a reducing agent and catalyst in controlled oxidations; in the alkylation of aromatic compounds; and in the isomerization of conjugated diolefins. It is used as an intermediates for pharmaceuticals; dyes, photographic chemicals

Incompatibilities: The aqueous solution is a strong acid. Violent reaction with strong oxidizers, strong caustics; and many organic compounds, causing fire and explosion hazard. Reacts with water, forming toxic hydrobromic acid. Incompatible with aliphatic amines, alkanolamines, alkylene oxides; aromatic amines; amides, ammonia, ammonium hydroxide; calcium oxide; epichlorohydrin, fluorine, isocyanates, oleum, organic anhydrides; sulfuric acid; sodium tetrahydroborate; vinyl acetate. Hydrobromic acid is highly corrosive to most metals forming flammable hydrogen.

Permissible Exposure Limits in Air

NIOSH IDLH = 30 ppm

Conversion factor: 1 ppm = 3.31 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 3 ppm/10 milligram per cubic meter TWA

NIOSH REL: 3 ppm/10 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 2 ppm/6.8 milligram per cubic meter TWA Ceiling Concentration (2001).

PAC-2: $\mathbf{40_A}$ ppm

PAC-3: $\mathbf{120_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minutes values.

DFG MAK: 2 ppm/6.7 milligram per cubic meter TWA; Peak Limitation value I(1); Pregnancy Risk Group D Australia: TWA 3 ppm (10 milligram per cubic meter), 1993; Austria: MAK 3 ppm (10 milligram per cubic meter), 1999; Belgium: STEL 3 ppm (9.9 milligram per cubic meter), 1993; Denmark: TWA 3 ppm (10 milligram per cubic meter), 1999; Finland: STEL 3 ppm (10 milligram per cubic meter) [skin] 1999; Norway: TWA 3 ppm (10 milligram per cubic meter), 1999; the Philippines: TWA 3 ppm (10 milligram per cubic meter), 1993; Poland: MAC (TWA) 7 milligram per cubic meter, MAC (STEL) 21 milligram per cubic meter, 1999; Russia: STEL 2 milligram per cubic meter, 1993; Switzerland: MAK-W 3 ppm (10 milligram per cubic meter), KZG-W 6 ppm (20 milligram per cubic meter), 1999; Turkey: TWA 5 ppm (17 milligram per cubic meter), 1993; United Kingdom: STEL 3 ppm (10 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 3 ppm. Several states have set guidelines or standards for hydrogen bromide in ambient air[60] ranging from 80.0 μ/m^3 (Virginia) to 100.0 μ/m^3 (North Dakota) to 200.0 μ/m^3 (Connecticut and New York) to 238.0 μ/m^3 (Nevada).

Determination in Air: Collection using Si gel; workup with $NaHCO_3/Na_2CO_3$; Analysis by ion chromatography; NIOSH (IV), Method #7903, Inorganic Acids; OSHA Analytical Method ID-165SG.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hydrogen bromide is a corrosive chemical and contact can severely burn the eyes, with permanent damage. It can cause severe burns of the skin. Exposure can irritate the eyes, nose, throat and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. Contact with liquid can cause frostbite.

Long-Term Exposure: Long-term exposure can irritate the lungs and cause a chronic discharge. Bronchitis may develop with cough, phlegm, and/or shortness of breath. It may damage the sense of smell. Long-term exposure can also cause chronic indigestion and may damage the nervous system. Repeated skin contact can cause an acne-like rash to develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Serum bromine level. Exam of the nervous system.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Wear splash-proof chemical goggles and face shield when working with the liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *30 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprAg (APF = 25) [any powered, air-purifying respirator with acid gas cartridge(s)]; or GmFAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed.

Storage: Check oxygen content prior to entering storage area. Poisonous corrosive gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (3) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. This gas is toxic and/or corrosive, nonflammable. Outside or detached storage is preferred in an area that is roofed, shaded with the cylinders stored off the ground on nonwooden floors, and away from radiant heat sources and all possible sources of ignition. If indoors or outdoors, store in a well-ventilated noncombustible location temperatures not to exceed 50°C. Automatic monitoring systems are also preferred. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Hydrogen bromide must be stored to avoid contact with strong oxidizers, caustics, metals and moisture, because violent reactions occur. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1048 Hydrogen bromide, anhydrous, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone C. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. UN1788 Hydrobromic acid, with >49% hydrobromic acid or Hydrobromic acid, with not >49% hydrobromic acid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling:

Hydrogen bromide, anhydrous

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

UN1048:

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)

Day 0.8/1.2
Night 2.4/3.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Hydrogen bromide is noncombustible. Reacts with water to produce toxic hydrobromic acid. Fight surrounding fire with an agent appropriate for surrounding fire. Thermal decomposition products may include bromine and hydrogen bromide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Soda ash/slaked lime is added to give a neutral bromide solution which is discharged to sewers or streams with water dilution.

Hazard symbols, risk, & safety statements: Hazard symbol: T, C; risk phrases: R5; R21; R23; R35; safety phrases: S1/2; S9; S26; S33; S36/37/39; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hydrogen chloride is a colorless to slightly yellow refrigerated gas or fuming liquid with a pungent, irritating odor. May be shipped and stored as a cryogenic liquid. The aqueous solution is known as hydrochloric acid or muriatic acid and may contain as much as 38% HCl. Shipped as a liquefied compressed gas. The odor threshold is 0.77 ppm. Molecular weight = 36.46; specific gravity (H_2O:1) = 1.49 @ 20°C; boiling point = −85°C; freezing/melting point = −114.2°C; relative vapor density (air = 1) = 1.27; vapor pressure = 750 mmHg @ −85°C.

Hazard Identification (based on NFPA-704 M Rating System) (*40%*): Health 3, flammability 0, reactivity 2; (refrigerated gas) Health 3, flammability 0, reactivity 1. Highly corrosive. Soluble in water; solubility = 67% @ 30°C.

Potential Exposure: Hydrogen chloride itself is used in the manufacture of pharmaceutical hydrochlorides, chlorine, vinyl chloride from acetylene; alkyl chlorides from olefins; arsenic trichloride from arsenic trioxide; in the chlorination of rubber; as a gaseous flux for babbitting operations; and in organic synthesis involving isomerization, polymerization, alkylation, and nitration reactions. The acid is used in the production of fertilizers, dyes, dyestuffs, artificial silk, and paint pigments; in refining edible oils and fats; in electroplating; leather tanning; ore refining; soap refining; petroleum extraction; pickling of metals; and in the photographic, textile, and rubber industries. It has been used as a choking/pulmonary agent.

Incompatibilities: The aqueous solution is a strong acid. Corrosive fumes emitted on contact with air. Reacts violently with bases, oxidizers forming toxic chlorine gas. Reacts, often violently, with acetic anhydride, active metals; aliphatic amines; alkanolamines, alkylene oxides; aromatic amines; amides, 2-aminoethanol, ammonia, ammonium hydroxide; calcium phosphide; chlorosulfonic acid; ethylene diamine; ethyleneimine, epichlorohydrin, isocyanates, metal acetylides, oleum, organic anhydrides; perchloric acid, 3-propiolactone, uranium phosphide; sulfuric acid; vinyl acetate; vinylidene fluoride. Highly corrosive to most metals, forming flammable hydrogen gas. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 ppm

Conversion factor: 1 ppm = 1.49 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.77 ppm.

OSHA PEL: 5 ppm/7 milligram per cubic meter Ceiling Concentration NIOSH REL: 5 ppm/7 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 2 ppm/2.98 milligram per cubic meter Ceiling Concentration; not classifiable as a human carcinogen PAC* Ver. 29[138]

PAC-1: **1.8**$_{\mathbf{A}}$ ppm

PAC-2: **22**$_{\mathbf{A}}$ ppm

PAC-3: **100**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 2 ppm/3 milligram per cubic meter; Peak Limitation Category I(2); Pregnancy Risk Group C

Several states have set guidelines or standards for HCl in ambient air[60] ranging from 10 μ/m^3 (Massachusetts) to 70 μ/m^3 (North Dakota) to 120 μ/m^3 (Virginia) to 140 μ/m^3 (New York and South Dakota) to 167 μ/m^3 (Nevada) to 175 μ/m^3 (South Carolina) to 600−2000 μ/m^3 (Rhode Island) to 700 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH (IV), Method #7903, Inorganic Acids; OSHA Analytical Method ID-165SG.

Routes of Entry: Inhalation of gas or mist, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Signs and symptoms of acute ingestion of hydrogen chloride may be severe and include salivation, intense thirst; difficulty in swallowing; chills; pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of hydrogen chloride. Acute inhalation exposure of hydrogen chloride may result in sneezing, hoarseness, choking, laryngitis, and respiratory tract irritation. Bleeding of nose and gums, ulceration of the nasal and oral mucosa; bronchitis, pneumonia, dyspnea (shortness of breath), chest pain; and pulmonary edema may also occur. If the eyes have come in contact with hydrogen chloride, irritation, pain, swelling, corneal erosion; and blindness may result. Dermal exposure may result in dermatitis (red, inflamed skin), severe burns, and pain.

Short-Term Exposure: HCl is corrosive to the eyes, skin, and respiratory tract. Inhalation of high concentrations of vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May cause inflammation and destruction of the nasal passages, dental erosion; loss of voice; coughing, pneumonia, headaches and rapid throbbing of the heart. May cause death in the range of 1000−2000 ppm. Skin contact can cause irritation or burns of the skin. Eye contact may cause irritation and severe damage to the surface of the eye, severe burns and loss of sight. Contact with the liquid may cause frostbite. Ingestion may cause irritation of mouth, throat and stomach; salivation, nausea, vomiting, chills and fever; holes in the intestinal tract; inflammation of the kidneys; and shock.

Long-Term Exposure: Irritates the lungs, causing chronic bronchitis. May cause irritation and skin rash. Long term exposure to low levels (greater than 5 ppm) of hydrogen chloride can cause some dental erosion. Aside from such dental erosions, no significant abnormalities have been associated with long term low level exposures. There is limited evidence that workers involved in the manufacturing of hydrogen chloride have an increase of respiratory cancers.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 second). For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Decontamination: This is very important, and you have to decontaminate as soon as you can. The gas is very soluble in water, forming hydrochloric acid. Since the more concentrated the acid, the more dangerous it is; consequently, the acid must be diluted it as much as possible. Decontamination must be started quickly before it has time to do much damage. Extra minutes before decontamination can make a big difference. Although hydrogen chloride is a gas, the victim can't spread the agent to others. But, if the victim is wet, or the victim's clothes are wet, hydrochloric acid may be spread to others outside the hot and warm zones. So, wash a victim thoroughly so that he can't spread the acid to others. If you don't have the equipment and training, don't enter the hot zone to rescue and decontaminate victims. If the victim can't move, decontaminate without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Wash–strip–wash–evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and uphill direction. *Don't use household bleach or other bleach products* to decontaminate the victim. Wash the victim with warm water and soap. After decontamination, treat the acid burns as you would with burns from a fire. Decontaminate with water or with soap and water. Be sure you've decontaminated the victims as much as you can before they leave the area. If you get any of the acid on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can following the incident.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 ppm:* CcrS* (APF = 10) (any NIOSH/MSHA or European Standard EN 149-approved chemical cartridge respirator with cartridge(s) providing protection against the compound of concern); or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprS* (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

*Note**: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poisonous corrosive gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. This gas is toxic and/or corrosive, nonflammable. Outside or detached storage is preferred in an area that is roofed, shaded with the cylinders stored off the ground on nonwooden floors, and away from radiant heat sources and all possible sources of ignition. If indoors or outdoors, store in a well-ventilated noncombustible location temperatures not to exceed 50°C. Automatic monitoring systems are also preferred. Hydrogen chloride must be stored to avoid contact with any alkali or active metals (such as potassium, sodium, and zinc), because violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: UN1050 Hydrogen chloride, anhydrous Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone C.UN2186; Hydrogen chloride, refrigerated liquid, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 8-Corrosive material, Inhalation Hazard Zone C. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA

UN1050 Hydrogen chloride, anhydrous

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60

Then: Protect persons downwind (mi/km)

Day 0.2/0.3

Night 0.8/1.2

Anhydrous (gas): If hydrogen chloride gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If hydrogen chloride solution is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Collect material in a convenient manner and deposit in sealed containers. If necessary, dilute and/or neutralize the material before collection. It may be necessary to contain and dispose of hydrogen chloride as a hazardous waste. Contact the NJ Department of Environmental Protection (DEP) of the federal EPA for specific recommendations.

***Attention:** If dealing with a large spill from the following containers: See "*ERG* Table 3*: Initial Isolation and Protective Action Distances for Different Quantities of Six Common Toxic-by-Inhalation Gases.*" This specialized chart shows isolation protective distances for the transport containers listed above (numbers 1 through 4) and various wind conditions: Low wind (<6 mph); Moderate wind (6 to 12 mph); High wind (>12 mph). (1) Rail tank car, (2) Highway tank truck or trailer, (3) Multiple ton cylinders or (4) Multiple small cylinders or single ton cylinder.

UN2186 Hydrogen chloride, refrigerated liquid

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300

Then: Protect persons downwind (mi/km)

Day 1.3/2.0

Night 4.7/7.5

Refrigerated liquid: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. (The material itself does not burn, but contact with metals evolve flammable hydrogen gas which will increase the chance of explosion.) Thermal decomposition products may include chlorine and hydrogen chloride. Use extinguishers suitable for surrounding fires other than water. Contact with water will produce heat and hydrochloric acid. If water is used, it must be used in flooding quantities. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not apply water to cryogenic liquid containers. If cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged periods, with draw to a secure location. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Soda ash-slaked lime is added to form the neutral solution of chloride of sodium and calcium. This solution can be discharged after dilution with water[22]. Alternatively, hydrogen chloride can be recovered from a variety of process waste streams.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P063

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313 Form R de minimis concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: F+, T+, N; R12; R19; R26; R50/53; safety phrases: S1/2; S7/9; S16; S26; S29/35; S36/37/S38; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hydrogen cyanide (AC) is a volatile, colorless or pale-blue liquid; or a colorless gas. AC gas has a distinctive bitter almond odor (others describe a musty "old sneakers smell"), but a large proportion of people cannot detect it; the odor does not provide adequate warning of hazardous concentrations. It also has a bitter burning taste and is often used as a solution in water. The odor threshold is 0.58 ppm. Odor is *not* a reliable indicator of toxic amounts of vapor. Often used as a 96% solution in water. It is intensely poisonous, highly flammable, and explosive. Molecular weight = 27.03; specific gravity (H_2O:1) = 0.69 (liquid) @ 20°C; boiling point = 26°C (96%); freezing/melting point = −13.3°C (96%); vapor pressure = 750 mmHg @ 25.4°C; flash point = −17.8°C (cc) (96%); autoignition temperature = 537.8°C (96%). Explosive limits: LEL = 5.6%; UEL: 40.0%[17]. Hazard Identification (based on NFPA-704 M Rating System): Health 4, flammability 4, reactivity 2. Soluble in water.

Potential Exposure: Hydrogen cyanide is used in chemical synthesis of sequestrants, polymers, weed killers, and pharmaceuticals; as a fumagant; in electroplating, mining, chemical synthesis, and the production of synthetic fibers, plastics, dyes, and pesticides; in chemical synthesis of acrylates and nitriles, particularly acrylonitrile. It may be generated in blast furnaces, gas works, and coke ovens. Cyanide salts have a wide variety of uses, including steel hardening; gold and silver extraction from ores. AC is used as a chemical warfare agent (blood agent); systemic agent. It forms cyanide in the body.

Incompatibilities: Unless stabilized and maintained, samples stored more than 90 days are hazardous. Dangerous boiling point range. The gas can form an explosive mixture with air. Material containing more than 2%−5% water are less stable than dry material and can be self-reactive, forming an explosive mixture with air. Heat above 50 to 60°C or contact with heat, water, alkaline material, amines, or strong bases can cause polymerization. The aqueous solution is a weak acid. Violent reaction with oxidizers, acetaldehyde, acids, hydrogen chloride in alcoholic mixtures; sodium carbonate; caustic substances, causing fire and explosion hazard. Incompatible with amines, strong acids; sodium hydroxide; calcium hydroxide; sodium carbonate; ammonia. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 ppm

Conversion factor: 1 ppm = 1.10 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/11 milligram per cubic meter TWA [skin]

NIOSH REL: 4.7 ppm/5 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 4.7 ppm/5 mg[CN]/m^3 Ceiling Concentration [skin]

PAC AC 74-90-8*, Ver. 29[138]

PAC-1: **2**$_{\mathbf{A}}$ ppm

PAC-2: **7.1**$_{\mathbf{A}}$ ppm

PAC-3: **15**$_{\mathbf{A}}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Emergency Response Planning Guidelines

ERPG-1: inappropriate

ERPG-2: 10 ppm

ERPG-3: 25 ppm

DFG MAK: 1.9 ppm/2.1 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C

Arab Republic of Egypt: TWA 10 ppm (10 milligram per cubic meter), 1993; Australia: TWA 10 ppm (10 milligram per cubic meter) [skin], 1993; Austria: MAK 10 ppm (11 milligram per cubic meter) [skin], 1999; Denmark: TWA 5 ppm (5 milligram per cubic meter) [skin], 1999; Finland: STEL 10 ppm (11 milligram per cubic meter) [skin], 1999; France: VME 2 ppm (2 milligram per cubic meter), VLE 10 ppm (10 milligram per cubic meter), 1999; Hungary: TWA 0.3 milligram per cubic meter; STEL 0.6 milligram per cubic meter [skin], 1993; the Netherlands: MAC 11 milligram per cubic meter [skin], 2003; Norway: TWA 5 ppm (5 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (11 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 0.3 milligram per cubic meter, ceiling 10 milligram per cubic meter, 1999; Russia: TWA 10 ppm; STEL 0.3 milligram per cubic meter, 1993; Sweden: ceiling 5 milligram per cubic meter [skin], 1999; Switzerland: MAK-W 10 ppm (11 milligram per cubic meter), KZG-W 20 ppm (22 milligram per cubic meter) [skin], 1999; Thailand: TWA 10 ppm (11 milligram per cubic meter), 1993; Turkey: TWA 10 ppm (11 milligram per cubic meter) [skin], 1993; United Kingdom: STEL 10 ppm (11 milligram per cubic meter) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 4.7 ppm[CN] [skin]. Several states have set guidelines or standards for hydrogen cyanide in ambient air[60] ranging from 33 μ/m^3 (New York) to 80 μ/m^3 (Virginia) to 100 μ/m^3 (North Dakota) to 220 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada) to 250 μ/m^3 (South Carolina) to 120−1000 μ/m^3 (North Carolina). The Czech Republic: MAC 0.3 milligram per cubic meter. In ambient air in residential areas, Russia set a MAC of 0.01 mg/m on a daily average basis. In ambient air in residential areas, the Czech Republic[35] has set 0.008 milligram per cubic meter on both a momentary and daily average basis.

Determination in Air: Use NIOSH (IV), Method #6010; #6017. Also use NIOSH Analytical Method #7904 Cyanides (aerosol and gas).

Permissible Concentration in Water: A USPHS drinking water criterion for alternate source selection is 100 μg/L[32].

Determination in Water: Octanol−water coefficient: Log K_{ow} = −0.25. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor; percutaneous absorption of liquid and concentrated vapor; ingestion and eye and skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hydrogen cyanide can irritate the and burn the skin and eyes. Inhalation can irritate the respiratory tract. Lacrimation (tearing) and a burning sensation of the mouth and throat are common. Can cause dizziness, headache, weakness, anxiety, confusion, pounding heart; difficult breathing and nausea. These can rapidly lead to convulsions and death unless exposure is immediately stopped and proper first aid applied. High exposure can cause sudden death. Signs and symptoms of acute exposure to hydrocyanic acid may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry red mucous membranes and blood may be noted. Cardiac arrhythmias and other cardiac abnormalities are common. Cyanosis (blue tint to the skin and mucous membranes) may be observed. Weakness, headache, vertigo (dizziness), agitation, giddiness, salivation, nausea, and vomiting; may be followed by combative behavior, convulsions, paralysis, protruding eyeballs; dilated and unreactive pupils; and coma. Tachypnea (rapid, shallow respirations) or hyperpnea (rapid, deep respirations) may be followed by respiratory depression. Lung hemorrhage and pulmonary edema may also occur. *Inhalation:* At less than 20 ppm, exposure to hydrogen cyanide may produce headache, dizziness, nausea and vomiting. Concentrations greater than 50 ppm may cause difficulty in breathing; rapid throbbing of the heart; paralysis, unconsciousness, respiratory arrest or death. 30 minutes exposure to 135 ppm may cause death. 270 ppm has caused immediate death. *Skin:* Hydrogen cyanide is readily absorbed through the skin. Symptoms are similar to above. *Eyes:* Hydrogen cyanide is irritating to the eye and rapidly absorbed. *Ingestion:* Symptoms are similar to above. Death has resulted from ingestion of 570 mg/kg of 1.4 oz for a 150 pound person.

Long-Term Exposure: Repeated exposure can interfere with thyroid function and can cause goiter. Itching scarlet rash, red bumps; severe nose itch leading to bleeding; and possibly holes in the nose; may result from long term exposure to hydrogen cyanide. Headache, nausea, vomiting, weakness and enlarged thyroid gland have also been reported at exposures from 4 to 12 ppm. May damage the nervous system.

Points of Attack: Central nervous system; cardiovascular system, thyroid, blood.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), lactic acid, pH (Hydrogen ion concentration), carboxyhemoglobin; blood plasma, bicarbonate, electrocardiogram, on workers over 40 years; expired air. Preplacement and periodic examinations should include the cardiovascular and central nervous systems, liver and kidney function, blood, history of fainting or dizzy spells. Blood cyanide test. Evaluation of thyroid function. Examination of the nervous system. Urinary thiocyanate levels have been used, but are nonspecific and are elevated in smokers.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you don't have the equipment and training, don't enter the hot zone to rescue and decontaminate victims. If the victim can't move, decontaminate without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Wash–strip–wash–evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Be sure you've decontaminated the victims as much as you can before they leave the area so that they don't spread the agent. If you get some of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 ounces per 5 gal of water) to decontaminate scissors used in clothing removal, and other items.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally-encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using Air Purifying Respirators (APR) or Powered APR (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times.

Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. *47 ppm:* Sa (APF = 10) (any supplied-air respirator). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Blue: Health Hazard/Toxics/ Poisons: Store in a secure poison location. (2) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials and conditions (see above). Store outdoors, if possible, or indoors in standard combustible liquid storage room or cabinet, away from sources of ignition. Protect containers against physical damage. Metal containers involving the transfer of this chemical should be grounded and bonded. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: PIH; check oxygen content prior to entering storage area. UN1051 Hydrogen cyanide, stabilized with <3% water, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Inhalation Hazard Zone A; UN1614 Hydrogen cyanide, stabilized, with <3% water and absorbed in a porous inert material, Hazard class: 6.1; Labels: 6.1-Poisonous materials, Potential Inhalation Hazard (Special Provision 5) Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

Hydrogen cyanide

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Hydrocyanic acid, aqueous solutions, with >20% Hydrogen cyanide; Hydrogen cyanide, anhydrous, stabilized; Hydrogen cyanide, stabilized

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1250/400
Then: Protect persons downwind (mi/km)
Day 0.9/1.5
Night 2.4/3.8

Hydrogen cyanide, stabilized, with <3% water and absorbed in a porous inert material

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.1/1.8

AC, when used as a weapon

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.6/1.0

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 2.3/3.7
Night 5.3/8.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stay upwind; keep out of low areas. Ventilate closed spaces before entering. Use water spray to reduce vapors. Do not touch spilled material; stop leak if you can do it without risk. Shut off ignition; no flares, smoking, or flames in hazard area. Isolate area until gas is dispersed. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include cyanide. If material is on fire and conditions permit, do not extinguish; combustion products are less toxic than the material itself. Cool exposures using unattended monitors. *Do not use water* directly on fire as cyanide gas may form. Use water to control vapors only. May react with itself without warning with explosive violence.

Gas: This chemical is a flammable gas. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Evacuate area endangered by gas. See isolation distance above if tank car or truck is involved in fire. Use dry chemicals, alcohol resistant (AFFF) foam, or carbon dioxide. Small fires; let burn unless leak can be stopped immediately. *Large fires:* water spray, fog or foam. Move container from fire area if you can do it without risk. Stay away from ends of tanks. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Cool container with water using unmanned device until well after fire is out. Isolate area until gas has dispersed. Firefighting should be done from a safe distance. A few whiffs of gas, or liquid penetrating firefighter's protective clothing, could be fatal. Only special protective clothing should be worn.

Liquid: This chemical is a flammable liquid. Use dry chemical, carbon dioxide; or alcohol resistant (AFFF) foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames of the surface of the burning liquid. Do not direct straight streams into the liquid. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Chemical conversion to ammonia and carbon dioxide using chlorine or hypochlorite in a basic media. Controlled incineration is also adequate to totally destroy cyanide[22]. Alternatively, HCN can be recovered, from ammonoxidation process waste streams for example. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Hydrogen fluoride is a colorless, fuming liquid below 19.4°C, or gas with a strong, irritating odor. Hydrogen fluoride mixes readily with water, forming hydrofluoric acid. Molecular weight = 20.01; specific gravity (H_2O:1) = 0.82 (liquid) @ 20°C; boiling point = 19.5°C; freezing/melting point = −83.4°C; vapor pressure = 750 mmHg @ 19.2°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 1₩. Highly soluble in water, forming hydrofluoric acid.

Potential Exposure: Hydrogen fluoride, its aqueous solution hydrofluoric acid, and its salts, are used in special metallurgical process; nuclear engineering; making organic and inorganic fluorine compounds, such as fluorides and plastics; as a catalyst, particularly in paraffin alkylation in the petroleum industry; as an insecticide; and to arrest the fermentation in brewing. It is utilized in the fluorination processes, especially in the aluminum industry; in separating uranium isotopes; in cleaning cast iron, copper, and brass; in removing efflorescence from brick and stone; in removing sand from metallic castings; in frosting and etching glass and enamel; in polishing crystal; in decomposing cellulose; in enameling and galvanizing iron; in working silk; in dye and analytical chemistry, and to increase the porosity of ceramics.

Incompatibilities: A super-strong acid; aqueous solutions are less strong. Reacts violently with bases. Reacts, possibly with violence, with many compounds including acetic anhydride, aliphatic amines; alcohols, alkanolamines, alkylene oxides; aromatic amines; amides, 2-aminoethanol, ammonia, ammonium hydroxide; arsenic trioxide; bismuthic acid; calcium oxide; ethylene diamine; ethyleneimine, epichlorohydrin, isocyanates, metal acetylides; nitrogen trifluoride; oleum, organic anhydrides; oxygen difluoride; phosphorous pentoxide; sulfuric acid; strong oxidizers; vinyl acetate; vinylidene fluoride. Attacks glass, concrete, ceramics, and other silicon-containing compounds. Attacks metals, some plastics, rubber and coatings.

Permissible Exposure Limits in Air

As fluorides

NIOSH IDLH = 30[F]ppm Odor threshold = 0.03 milligram per cubic meter.

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3 [15-minutes] Ceiling Concentration

ACGIH TLV[1]: 5ppm/0.41 mg[F]/m^3 TWA; 2 ppm/1.64 mg[F]/m^3 Ceiling Concentration; [skin]; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

PAC HF*, Ver. 29[138]

PAC-1: $\mathbf{1.0_A}$ ppm

PAC-2: $\mathbf{24_A}$ ppm

PAC-3: $\mathbf{44_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Emergency Response Planning Guidelines

ERPG-1: 2 ppm

ERPG-2: 20 ppm

ERPG-3: 50 ppm

DFG MAK: 1 ppm/0.83 mg[F]/m^3 [skin]; Peak Limitation Category I(2); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Arab Republic of Egypt: TWA 2 ppm (2 milligram per cubic meter), 1993; Australia: TWA 3 ppm (2.5 milligram per cubic meter), 1993; Austria: MAK 3 ppm (2.5 milligram per cubic meter, 1999; Belgium: STEL 3 ppm (2.6 milligram per cubic meter), 1993; Denmark: TWA 2 ppm (1.6 milligram per cubic meter), 1999; Finland: ceiling 3 ppm [skin] 1999; France: VLE 3 ppm (2.5 milligram per cubic meter), 1999; Hungary: TWA 0.5 milligram per cubic meter; STEL 1 milligram per cubic meter, 1993; Japan: 3 ppm (2.5 milligram per cubic meter), 1999; Norway: TWA 0.8 ppm (0.6 milligram per cubic meter), 1999; the Philippines: TWA 3 ppm (2 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.5 milligram per cubic meter, MAC (STEL) 4 milligram per cubic meter, 1999; Russia: TWA 3 ppm (0.1 milligram per cubic meter); STEL 0.5 milligram per cubic meter, 1993; Sweden: ceiling 2 ppm (1.7 milligram per cubic meter), 1999; Switzerland: MAK-W 1.8 ppm (1.5 milligram per cubic meter), KZG-W 3.6 ppm (3.0 milligram per cubic meter), 1999; Turkey: TWA 3 ppm (2 milligram per cubic meter), 1993; United Kingdom: STEL 3 ppm (2.5 mg[F]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 3 ppm[F]. Several states have set guidelines or standards for hydrogen fluoride in ambient air[60] ranging from 3.4 μ/m^3 (Massachusetts) to 8.3 μ/m^3 (New York) to 20.0 μ/m^3 (Virginia) to 25.0 μ/m^3 (North Dakota and South Carolina) to 30.0 μ/m^3 (Rhode Island) to 50.0 μ/m^3 (Connecticut and South Dakota) to 60.0 μ/m^3 (Nevada) to 25.0−250.0 μ/m^3 (North Carolina) to 830.0 μ/m^3 (Kentucky).

Determination in Air: Use NIOSH Analytical Method #3800, #7902, #7903, #7906; OSHA Analytical Method ID-110.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 ***mg/F/L, as Fluoride***.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.23$. Unlikely to bioaccumulate in marine organisms.***Routes of Entry:*** Inhalation, skin absorption; ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hydrogen fluoride is corrosive to the eyes, skin, and the respiratory tract. Eye burns may not be immediately painful. Inhalation of this gas can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High levels of exposure can cause death. Acute exposure to hydrogen fluoride will result in irritation, burns, ulcerous lesions; and necrosis of the eyes, skin, and mucous membranes. Total destruction of the eyes is possible. Other effects include nausea, vomiting, diarrhea, pneumonitis (inflammation of the lungs), and circulatory collapse. Ingestion of an estimated 1.5 g produced sudden death without gross pathological damage. Repeated ingestion of small amounts resulted in moderately advanced hardening of the bones. Contact of skin with anhydrous liquid produces severe burns. Inhalation of anhydrous hydrogen fluoride or hydrogen fluoride mist or vapors can cause severe respiratory tract irritation that may be fatal. Hydrogen fluoride may induce hypocalcemia, causing cardiac and renal failure.

Long-Term Exposure: The substance may cause fluorosis. Can irritate the lungs and may cause bronchitis. Long-term exposure may damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system; bones.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once (contact lenses *should not be worn* when working with HF) and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and flush immediately with large amounts of water. Immerse exposed skin area in iced 70% ethyl alcohol. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note:* safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APR or PAPR are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should *not* be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately flush with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *30 ppm:* CcrS (APF = 10)* [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or PaprS (APF = 25)* [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SA* (any supplied-air respirator); or SCBA (any SCBA). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: PIH; check oxygen content prior to entering storage area. Corrosive, toxic gas. (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. This gas is toxic and/or corrosive, nonflammable. Outside or detached storage is preferred in an area that is roofed, shaded with the cylinders stored off the ground on nonwooden floors, and away from radiant heat sources and all possible sources of ignition. If indoors or outdoors, store in a well-ventilated noncombustible location temperatures not to exceed 50°C. Automatic monitoring systems are also preferred. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Hydrogen fluoride must be stored to avoid contact with metals, concrete, glass and ceramics, because it can severely corrode these materials. See also "Incompatibilities;" listed above. Contact with metals may evolve flammable hydrogen gas. Keep away from heat.

Shipping: UN1052 Hydrogen fluoride, anhydrous, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials, Inhalation Hazard Zone C; UN1790 Hydrofluoric acid, with >60% strength & Hydrofluoric acid, with not >60% Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials.

Spill Handling:

Hydrogen fluoride, anhydrous

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

UN1052 Hydrogen fluoride, anhydrous

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.5

Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 0.9/1.5
Night 2.0/3.2

*Attention:** If dealing with a large spill from the following containers: (1) Rail tank car, (2) Highway tank truck or trailer, (3) Multiple ton cylinders or (4) Multiple small cylinders or single ton cylinder see the following: "ERG Table 3: Initial Isolation and Protective Action Distances for Different Quantities of Six Common Toxic-by-Inhalation Gases." This chart shows isolation protective distances for the transport containers listed above (numbers 1 through 4) and various wind conditions: Low wind (<6 mph); Moderate wind (6 to 12 mph); High wind (>12mph). Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Ventilate area of spill or leak. If a gas, stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If in liquid form, allow to vaporize and disperse the gas, or cover with sodium carbonate or an equal mixture of soda ash and slaked lime. After mixing, add water if necessary to form a slurry. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Hydrogen fluoride is a noncombustible liquid or gas. Contact with metals may evolve flammable hydrogen gas which can cause explosion. Use chemical extinguishers. Thermal decomposition products may include fluorine. Vapors are slightly lighter than air. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Use dry chemicals, foam, carbon dioxide. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Reaction with excess lime followed by lagooning and either recovery or landfill disposal of the separated calcium fluoride. The supernatant liquid from this process is diluted and discharged to the sewer[22]. Alternatively, hydrogen can be recovered and recycled in many cases. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Hydrogen peroxide is a colorless liquid with a sharp odor and bitter taste. Molecular weight = 34.02; Specific gravity (H_2O:1) = 1.44; boiling point = 141°C (90%); 125°C (70%); 106°C (30%); freezing/melting point = −43C°; −39°C (70%); −11°C (90%); vapor pressure = 0.75 mmHg @ 13°C. Hazard Identification (based on NFPA-704 M Rating System): (30% solution) Health 3, flammability 0, reactivity 1 (Oxidizer). Hydrogen peroxide is completely miscible with water and is commercially sold in concentrations of 3%, 35%, 50%, 70%, and 90% solutions. It is not flammable.

Potential Exposure: Hydrogen peroxide is used in the manufacture of acetone, antichlor, antiseptics, benzoyl peroxide; buttons, disinfectants, pharmaceuticals, felt hats; plastic foam; rocket fuel; sponge rubber, and pesticides; as a food and feed additive; flavor; as a packaging material; in bleaching bone; feathers, flour, fruit, fur, gelatin, glue, hair, ivory, silk, soap, straw, textiles, wax, and wood pulp; and as an oxygen source in respiratory protective equipment. Other specific occupations with potential exposure include liquor and wine agers; dyers, electroplaters, fat refiners, photographic film developers; wool printers; veterinarians, and water treaters.

Incompatibilities: Contact with combustible material may result in SPONTANEO United States combustion. A powerful oxidizer; attacks many substances. Attacks many organic substances, such as wood, textile, and paper. Contact with most organic, readily oxidizable materials, reducing agents and combustibles cause fire and explosions, particularly in the presence of metals. Contact with iron, copper, brass, bronze, chromium, zinc, lead, manganese, silver and catalytic metals (and their salts), especially in a basic (pH 7 or above) environment, cause rapid decomposition with evolution of oxygen gas, which increases fire hazard. Attacks, and may ignite, some plastics, rubber and coatings. Decomposes slowly at ordinary temperatures and builds up pressure in a closed container. The rate of decomposition doubles for each 50°F/10°C rise (1.5 times 10°C rise) in temperature and becomes self-sustaining @ 285°F/141°C.

Permissible Exposure Limits in Air

NIOSH IDLH = 75 ppm

Conversion factor: 1 ppm = 1.39 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1 ppm/1.4 milligram per cubic meter TWA

NIOSH REL: 1 ppm/1.4 milligram per cubic meter TWA

ACGIH TLV[1] 1 ppm/1.4 milligram per cubic meter TWA; confirmed animal carcinogen with unknown relevance to humans.

PAC-3: 330 ppm

DFG MAK: 0.5 ppm/0.71 milligram per cubic meter TWA; Peak Limitation Category I(1); Carcinogen Category 4; Pregnancy Risk Group C

Australia: TWA 1 ppm (1.5 milligram per cubic meter), 1993; Belgium: TWA 1 ppm (1.4 milligram per cubic meter), 1993; Finland: TWA 1 ppm (1.4 milligram per cubic meter); STEL 3 ppm (4.2 milligram per cubic meter), 1999; France: VME 1 ppm (1.5 milligram per cubic meter), 1993; Norway: TWA 1 ppm (1.4 milligram per cubic meter), 1999; the Philippines: TWA 1 ppm (1.4 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 1.4 milligram per cubic meter, 2003; Turkey: TWA 1 ppm (1.4 milligram per cubic meter), 1993; United Kingdom: TWA 1 ppm (1.4 milligram per cubic meter; STEL 2 ppm (2.8 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for hydrogen peroxide in ambient air[60] ranging from 15 μ/m^3 (North Dakota) to 25 μ/m^3 (Virginia) to 28 μ/m^3 (Connecticut) to 36 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Method #1019 (January 2016); OSHA Analytical Method #ID126SG.

Routes of Entry: Inhalation of vapor or mist, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Hydrogen peroxide is corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Signs and symptoms of acute exposure to hydrogen peroxide may be severe and include irritation or burns to the skin, eyes, respiratory tract; mouth, esophagus, stomach; and intestines. Distension or rupture of the stomach and other hollow viscera may occur; vomiting is common. Corneal ulceration may develop.

Long-Term Exposure: Because this is a potential mutagen, handle it as a possible cancer-causing substance—with extreme caution. Can irritate the lungs. Repeated exposure may cause bronchitis. Repeated skin contact can cause a rash with redness and blisters.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected: consider chest X-ray if pulmonary edema is suspected.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For hydrogen peroxide (30%−70%), Neoprene + Natural rubber; and Neoprene/natural rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Where fumes or vapor are excessive, workers should be provided with gas masks with full facepieces and proper canisters or supplied air respirators. Additional health hazards may occur from the decomposition of hydrogen peroxide. Oxygen, possibly at high pressure, may form, which may create an explosion hazard. Hydrogen peroxide is generally handled in a closed system to prevent contamination. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 ppm:* SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *75 ppm:* SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:PD,PP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. (1) Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. *Note:* Store corrosives in this group in chemical-resistant secondary containers and/or in corrosion proof cabinets. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Hydrogen peroxide must be stored to avoid contact with iron, copper, chromium, brass, bronze, lead, silver, manganese, and their salts, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from alcohols, glycerol, organic materials and radiant heat, including sunlight. Containers should be protected from physical and mechanical disturbances.

Sources of ignition, such as smoking and open flames are prohibited where hydrogen peroxide is used, handled, or stored in manner that could create a potential fire or explosion hazard. Wherever hydrogen peroxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2984 Hydrogen peroxide, aqueous solutions with not <8% but <20% hydrogen peroxide, stabilized as necessary, Hazard Class: 5.1; Labels: 5.1-Oxidizer.UN2014 Hydrogen peroxide, aqueous solutions with not <20% but not >40% hydrogen peroxide, stabilized as necessary or hydrogen peroxide *aqueous solutions*, stabilized with >60% hydrogen peroxide or Hydrogen peroxide, *aqueous solutions with >40% but not >60% hydrogen peroxide*, stabilized as necessary Hazard Class: 5.1; Labels: 5.1-Oxidizer, 8-Corrosive material. UN2015 Hydrogen peroxide, stabilized, Hazard Class: 5.1; Labels: 5.1-Oxidizer, 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use a large quantity of water to wash down spills and reduce the flammable vapors. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible, but highly reactive and can increase the intensity of fire. Fires should be fought with water only. Do not use dry chemical, carbon dioxide; or foams. *Large fires:* flood fire area with water. Flammable vapors may accumulate in storage areas and containers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dilution with water to release the oxygen. After decomposition, the waste stream may be discharged safely[22].

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: T+, F+, N; risk phrases: R5; R12; R21; R23/25; R33; R50/53; Safety phrases S1/2; S9; S20/21; S28; S29; S33; S38; S41; S45; S60; S61.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hydrogen selenide is a colorless, flammable gas. Very offensive odor, resembling decayed horseradish. The odor threshold is 0.3 ppm (higher than the occupational exposure limits); many people rapidly lose the ability to detect the odor of hydrogen selenide so it is not a reliable warning of exposure. Molecular weight = 80.98; specific gravity (H_2O:1) = 2.1 (liquid); boiling point = −41.4°C; freezing/melting point = −64°C; relative vapor density (air = 1): 2.80; vapor pressure = 7600 mmHg @ 23.4°C; flash point = flammable gas. Explosive limits: LEL = 56,000 ppm; UEL: unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 4, flammability 4, reactivity 0. Soluble in water; solubility = 0.9% @ 22.7°C.

Potential Exposure: Hydrogen selenide is used in semiconductor manufacture. Also, it may be produced by the reaction of acids or water and metal selenides, or hydrogen and soluble selenium compounds.

Incompatibilities: Forms an explosive mixture with air. Contact with air causes the emission of toxic and corrosive fumes of selenium dioxide A strong reducing agent. Reacts violently with oxidizers, causing fire and explosion hazard. Incompatible with strong acids; water, halogenated hydrocarbons. Decomposes above 100°C, forming toxic and flammable products including selenium and hydrogen.

Permissible Exposure Limits in Air

NIOSH IDLH = 1 ppm

Conversion factor: 1 ppm = 3.31 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.05 ppm[Se]/0.2 milligram per cubic meter TWA

NIOSH REL: 0.05 ppm/0.2 milligram per cubic meter TWA

ACGIH TLV[1]: 0.05 ppm/0.16 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: 0.045 ppm

PAC-2: $\mathbf{0.11_A}$ ppm

PAC-3: $\mathbf{0.33_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.015 ppm/0.050 milligram per cubic meter TWA; Peak Limitation Category I(2); Carcinogen Category 3B; Pregnancy Risk Group C

Australia: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; Austria: MAK 0.05 ppm (0.2 milligram per cubic meter), 1999; Belgium: TWA 0.05 ppm (0.16 milligram per cubic meter), 1993; Denmark: TWA 0.01 ppm (0.05 milligram per cubic meter), 1999; Finland: STEL 0.01 ppm (0.03 milligram per cubic meter), 1999; France: VME 0.02 ppm (0.08 milligram per cubic meter), 1999; Japan: 0.05 ppm (0.17 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.1 mg[Se]/m^3, 2003; Norway: TWA 0.01 ppm (0.05 milligram per cubic meter), 1999; the Philippines: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.1 mg[Se]/m^3, MAC (STEL) 0.3 mg[Se]/m^3, 1999; Russia: TWA 0.05 ppm, 1993; Switzerland: MAK-W 0.05 ppm (0.17 milligram per cubic meter); STEL 0.1 ppm, 1999; Turkey: TWA 0.05 ppm (0.2 milligram per cubic meter), 1993; United Kingdom: TWA 0.05 ppm (0.17 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: 0.05 ppm. Several states have set guidelines or standards for H_2Se in ambient air[60] ranging from 2 g/m^3 (North Dakota) to 3 μ/m^3 (Virginia) to 4 μ/m^3 (Connecticut) to 5 μ/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: Hazardous to the aquatic environment. EPA[32] suggests a permissible ambient goal of 10 μg/L (the same as for selenium) based on health effects.

Routes of Entry: Inhalation, eye and/or skin contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause dizziness, fatigue, nausea, vomiting and diarrhea. *Inhalation:* The odor of hydrogen selenide in small concentrations e.g., below 1 ppm) disappears rapidly because of olfactory fatigue. The odor and irritating effects are not a reliable warning to gradually increasing concentrations. Low levels have caused coughing, sneezing and difficulty in breathing. Levels of 0.2 ppm may cause nausea, vomiting, a metallic taste in the mouth and garlic breath. Levels of 1.5 ppm may cause intolerable irritation of mouth and nose. Inhalation of the gas may cause pneumonitis. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin:* May cause irritation and red coloration of nails. Contact can cause a burning sensation on contact and rash. Contact with liquid may cause freezing burns. *Eyes:* Levels of 1.5 ppm are described as "intolerable." LD_{50} (rat, inhalation) = 2 ppm.

Long-Term Exposure: Repeated exposure can cause garlic odor on breath; dizziness, nausea, vomiting, labored breathing; bluing of skin; pulmonary edema; metallic taste; coughing, nasal secretion; pain in the chest; difficulty in breathing; irritation of the eyes; irritation of the respiratory tract resulting in bronchitis and conjunctivitis. It may also cause anemia. Animal studies suggest that liver damage and lung impairment are possible.

Points of Attack: Eyes, respiratory system; liver, blood.

Medical Surveillance: Consider the points of attack in replacement and periodic physical examinations. Liver function tests. CBC. Urine test for selenium (normal is less than 100 micrograms per liter of urine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of eye contact. Wear splash-proof chemical goggles and face shield when working with the liquid unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 0.5 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 1 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with hydrogen selenide all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store at room temperature away from contact with oxidizers, acids, water, and halogenated hydrocarbons. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN2202 Hydrogen selenide, anhydrous, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 3.1/4.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 5.3/8.5
Night 7.0 + /11.0*

* + means distance can be larger in certain atmospheric conditions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Warn other workers of leak. Evacuate area. Put on proper protective clothing and equipment. Stop flow of gas. Ventilate area. Remove sources of ignition. If leak cannot be stopped, move leaking cylinder to safe place out of doors. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. It decomposes above 100°C. Thermal decomposition products may include products of metal oxides and flammable selenium and hydrogen. This gas is under pressure; prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. Do not extinguish fire unless flow of gas can be stopped. *Small fires:* dry chemical or carbon dioxide. Stay upwind and uphill; keep out of low areas. Wear SCBA and full protective clothing. Use water in flooding quantities as fog. Cool containers that are exposed to flames with water until well after the fire is out. Gas is heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F+ ,T+ , N; risk phrases: R5; R12; R21; R26; R51; R44; R60; R62; safety phrases: S1/2; S9; S15; S16; S26; S28; S29/35; S33; S36/37/39/; S38; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Hydrogen sulfide is a flammable, colorless gas. Characteristic rotten egg odor. The odor threshold is 0.008 ppm. The sense of smell becomes rapidly fatigued and can NOT be relied upon to warn of the continuous presence of H_2S. Shipped as a liquefied compressed gas. Molecular weight = 34.04; specific gravity (H_2O:1) = 1.4 @ 20°C; boiling point = −60°C; freezing/melting point = −86°C; vapor pressure = 750 mmHg @ −60.5°C; Relative vapor density (air = 1) = 1.19; autoignition temperature = 260°C. Explosive limits: LEL = 4.0%; UEL: 44.0%. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 4, reactivity 0. Soluble in water; solubility = 0.45% @ 20°C.

Potential Exposure: Hydrogen sulfide is used in the synthesis of inorganic sulfides; sulfuric acid; and organic sulfur compounds; as an analytical reagent; as a disinfectant in agriculture; and in metallurgy. It is generated in many industrial processes as a by-product and also during the decomposition of sulfur-containing organic matter; so potential for exposure exists in a variety of situations. Hydrogen sulfide is found in natural gas, volcanic gas; and in certain natural spring waters. It may also be encountered in the manufacture of barium carbonate, barium salt; cellophane, depilatories, dyes, pigments, felt, fertilizer, adhesives, viscose rayon; lithopone, synthetic petroleum products; in the processing of sugar beets; in mining, particularly where sulfide ores are present; in sewers and sewage treatment plants; during excavation of swampy or filled ground for tunnels, wells, and caissons; during drilling of oil and gas wells; in purification of hydrochloric acid and phosphates; during the low temperature carbonization of coal; in tanneries, breweries, slaughterhouses; in fat rendering; and in lithography and photo-engraving.

Incompatibilities: A highly flammable and reactive gas; heating may cause violent combustion or explosion. May form explosive mixture with air. Incompatible with acetaldehyde, barium pentafluoride; chlorine monoxide; chlorine trifluoride; chromic anhydride; copper, lead dioxide; nitric acid; nitrogen iodide; nitrogen trichloride; nitrogen trifluoride; oxygen difluoride; oxidizers, phenyl diazonium chloride; sodium, sodium peroxide. Reacts with alkali metals. Attacks some plastics.

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 5 ppm/7.1 g/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C

Arab Republic of Egypt: TWA 10 ppm (14 milligram per cubic meter), 1993; Australia: TWA 10 ppm (14 milligram per cubic meter), STEL 15 ppm, 1993; Austria: MAK 10 ppm (15 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (14 milligram per cubic meter); STEL 15 ppm, 1993; Denmark: TWA 10 ppm (15 milligram per cubic meter), 1999; Finland: TWA 10 ppm (15 milligram per cubic meter); STEL 15 ppm (20 milligram per cubic meter) [skin], 1999; France: VME 5 ppm (7 milligram per cubic meter), VLE 10 ppm (14 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 15 milligram per cubic meter, 2003; Japan: 10 ppm (14 milligram per cubic meter), 1999; Norway: TWA 10 ppm (15 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (15 milligram per cubic meter), 1993; Poland: MAC (TWA) 10 milligram per cubic meter, MAC (STEL) 20 milligram per cubic meter, 1999; Russia: TWA 10 ppm, STEL 10 milligram per cubic meter, 1993; Sweden: NGV 10 ppm (14 milligram per cubic meter), KTV 15 ppm (20 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (15 milligram per cubic meter), KZG-W 20 ppm (30 milligram per cubic meter), 1999; Thailand: STEL 20 ppm, 1993; Turkey: TWA 10 ppm (15 milligram per cubic meter), 1993; United Kingdom: TWA 10 ppm (14 milligram per cubic meter), STEL 15 ppm (21 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 15 ppm. Russia[43] set a MAC in ambient air of residential areas of 0.008 milligram per cubic meter on both a momentary and a daily average basis. Several states have set guidelines or standards for hydrogen sulfide in ambient air[60] ranging from 14.0 μ/m^3 (South Carolina) to 230.0 μ/m^3 (Virginia) to 280.0 μ/m^3 (Connecticut) to 333.0 μ/m^3

Determination in Air: Use NIOSH (IV), Method #6013; OSHA Analytical Method ID-141.

Permissible Concentration in Water: EPA[32] suggests a permissible ambient goal of 207 μg/L based on health effects. EPA has established that hydrogen sulfide is a regulated toxic substance and is a hazardous substance defined under the Federal Water Pollution Control Act.

Routes of Entry: Inhalation of gas, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Signs and symptoms of acute exposure to hydrogen sulfide may include tachycardia (rapid heart rate) or bradycardia (slow heart rate), hypertension (low blood pressure), cyanosis (blue tint to skin and mucous membrane), cardiac palpitations; and cardiac arrhythmias. Dyspnea (shortness of breath), tachypnea (rapid respiratory rate), bronchitis, pulmonary edema; respiratory depression; and respiratory paralysis may occur. Neurological effects include giddiness, irritability, drowsiness, weakness, confusion, delirium, amnesia, headache, sweating, and dizziness. Muscle cramping, tremor, excessive salivation; cough, convulsions, and coma may be noted. Nausea, vomiting, and diarrhea are commonly seen. Exposure to hydrogen sulfide gas may result in skin irritation, lacrimation (tearing), inability to detect odors, photophobia (heightened sensitivity to light), and blurred vision.

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the central nervous system. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Levels of 20 ppm may cause headache, loss of appetite and dizziness. 50 ppm may cause muscle fatigue. 300 ppm may cause muscle cramps, low blood pressure; and unconsciousness after 20 minutes. Levels of 500 ppm can cause immediate loss of consciousness; slowed respiration and death in 30−60 minutes. At levels of 700 ppm and above respiratory paralysis and death can occur in seconds. Nonfatal cases may recover fully or may experience abnormal reflexes, dizziness, sleep disturbances and loss of appetite that last for months or years. *Skin:* Readily absorbed. May cause irritation, reddening and swelling. Contact with liquid can cause freezing burns. *Eyes:* Irritation may be felt at levels as low as 0.1 ppm. Levels of 10 ppm and above can cause irritation, pain, tearing; and increased light sensitivity. Liquid may cause freezing burns.

Long-Term Exposure: Long term exposure to low levels can cause pain and redness of the eyes with blurred vision. Repeated exposure can cause fatigue, loss of appetite; headaches, irritability, poor memory; dizziness, troubled sleeping; and nausea. Can cause irritation of the lungs and bronchitis with cough, phlegm, and/or shortness of breath. Animals studies showed that pigs that ate food containing hydrogen sulfide had diarrhea after a few days and weight loss after about 105 days.

Points of Attack: Eyes, lungs.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), carboxyhemoglobin; blood plasma; chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 second). For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood sulfide level (normal is less than 0.05 mg/L).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Because of poor warning signs, it may cause olfactory paralysis, and some persons are congenitally unable to smell H_2S. Accidental exposure may occur when workers enter sewage tanks and other confined areas in which hydrogen sulfide is formed by decomposition. In a number of cases workers enter unsuspectingly and collapse almost immediately. Workers, therefore, should not enter enclosed spaces without proper precautions. All Federal standard and other safety precautions must be observed when tanks or other confined spaces are to be entered. In areas where the exposure to hydrogen sulfide exceeds the standards, workers should be provided with full-face canister gas masks or preferable supplied air respirators. When liquid H_2S is involved, wear clothing to prevent skin freezing. Wear eye protection to prevent any reasonable probability of eye contact. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 100 ppm:* PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with hydrogen sulfide all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Hydrogen sulfide must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and nitric acid, since violent reactions occur. Outdoor or detached storage is preferred. Indoors, store in a cool, well-ventilated area. Sources of ignitions, such as smoking and open flames, are prohibited where hydrogen sulfide is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of hydrogen sulfide. Wherever hydrogen sulfide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1053 Hydrogen sulfide, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone B. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (*From a small package or a small leak from a large package*)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.5

Large spills (*From a large package or from many small packages*)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.0/1.5
Night 3.5/5.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain run-off. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable gas. Thermal decomposition products may include sulphur dioxide. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Hydrogen sulfide can be recovered as such or converted to elemental sulfur or sulfuric acid. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

R50; R61; R62; R63; safety phrases: S2; S24/25; S36/37/39; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Hydroquinone is a light-tan, light-gray, or colorless crystals. Molecular weight = 110.12; specific gravity (H_2O:1) = 1.4 @ 20°C; boiling point = 285°C; freezing/melting point = 172°C; vapor pressure = 1×10^{-4} mmHg @ 20°C; flash point = 165°C (molten); autoignition temperature = 516°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, Reactivity 0. Soluble in water; solubility = 7%; 5.9% @ 15°C.

Potential Exposure: Hydroquinone is a reducing agent and is used as an industrial chemical, chemical intermediate, pharmaceutical, and veterinary drug; as a photographic developer and as an antioxidant or stabilizer for certain materials which polymerize in the presence of oxidizing agents. Many of its derivatives are used as bacteriostatic agents (Ed.), particularly 2,5-bis(ethyleneimino) hydroquinone, have been reported to be a good antibiotic and tumor-inhibiting agent.

Incompatibilities: Hydroquinone is a reducing agent. Dust forms an explosive mixture with air. May explode on contact with oxygen. Incompatible with strong oxidizers, caustics; reacts violently with sodium hydroxide. May be oxidized to quinone at room temperatures in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 50 milligram per cubic meter

OSHA PEL: 2 milligram per cubic meter TWA

NIOSH REL: 2 milligram per cubic meter [15 minutes] Ceiling Concentration

ACGIH TLV[1]: 1 milligram per cubic meter TWA; danger of sensitization; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 3 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 120 milligram per cubic meter

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2; Germ Cell Mutagen Category 3A

Australia: TWA 2 milligram per cubic meter, 1993; Austria: MAK 2 milligram per cubic meter, 1999; Belgium: TWA 2 milligram per cubic meter, 1993; Denmark: TWA 2 milligram per cubic meter, 1999; Finland: TWA 2 milligram per cubic meter; STEL 4 milligram per cubic meter [skin] 1999; France: VME 2 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; the Philippines: TWA 2 milligram per cubic meter, 1993; Poland: MAC (TWA) 2 milligram per cubic meter, MAC (STEL) 4 milligram per cubic meter, 1999; Sweden: NGV 0.5 milligram per cubic meter, KTV 1.5 milligram per cubic meter, 1999; Switzerland: MAK-W 2 milligram per cubic meter, KZG-W 4 milligram per cubic meter, 1999; Turkey: TWA 2 milligram per cubic meter, 1993; United Kingdom: LTEL 2 milligram per cubic meter; STEL 4 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Russia set a MAC in ambient air in residential areas of 0.02 milligram per cubic meter on a once-daily basis[35]. Several states have set guidelines or standards for hydroquinone in ambient air[60] ranging from 6.67 μ/m^3 (New York) to 20.0 μ/m^3 (Florida and South Carolina) to 20.0−40.0 μ/m^3 (North Dakota) to 35.0 μ/m^3 (Virginia) to 40.0 μ/m^3 (Connecticut) to 48.0 μ/m^3 (Nevada).

Determination in Air: NIOSH (IV), Method #5004; OSHA Analytical Method PV-2094.

Permissible Concentration in Water: Russia set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.60$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of dust, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Can cause conjunctivitis; keratitis (inflammation of the cornea). Can affect the central nervous system and cause excitement. Signs and symptoms of acute exposure to hydroquinone may be severe and include dyspnea (shortness of breath); a sense of suffocation; increased respiratory rate; and respiratory failure. Pallor (paleness of skin); cyanosis (blue tint to skin and mucous membranes); and cardiovascular collapse may occur. Neurologic effects include headache, tinnitus (ringing in the ears), dizziness, delirium, muscle twitching; tremor; and convulsions. Nausea, vomiting, and the production of green to brown-green urine may also occur. Ingestion may cause respiratory failure. This material is very toxic; the probable oral lethal dose for humans is 50−500 mg/kg, or between 1 teaspoon and 1 ounce for a 150 lb person. Fatal human doses have ranged from 5 to 12 g, but 300−500 mg have been ingested daily for 3−5 months without ill effects. Death is apparently initiated by respiratory failure or anoxia.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. Hydroquinone cause changes in color of the conjunctiva, cornea, and skin. Over the years this can cause clouding of the eyes and permanent vision damage. May cause genetic damage, mutations in humans. Such chemicals have a cancer risk.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: ophthalmic examination; pulmonary function tests. Careful examination of the eyes, including visual acuity and slit lamp examinations, should be carried out in preplacement and periodic examinations. Also, the skin should be examined. Hydroquinone is excreted in the urine as a sulfate ester, although this has not been helpful in following worker exposure to dust.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene, natural rubber, and Viton are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended for this chemical by NIOSH. See NIOSH Criteria Document #78-155.

Respirator Selection: *up to 50 milligram per cubic meter:* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Note:* Substance causes eye irritation or damage; eye protection needed @ 50 and 100 milligram per cubic meter.

Based on potential carcinogenicity the following is also recommended by NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2662 Hydroquinone, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Stay upwind; keep out of low areas. Remove all ignition sources. Do not touch spilled material; stop leak if you can do it without risk. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Hydroquinone may burn but does not readily ignite. Thermal decomposition products may include oxides of carbon. For small fires use dry chemical, carbon dioxide; water spray or foam. Move container from fire area if you can do so without risk. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 seconds minimum), then scrub to remove harmful combustion products[22].

Hydroxylamine (& Salts) H:0500

Formula: H_3NO; $HONH_2$

Synonyms: Oxammonium

CAS Registry Number: 7803-49-8

Salts of hydroxylamine: 5470-11-1 (chloride); 13465-08-2 (nitrate); 10039-54-0 (sulfate)

HSDB Number: 579

RTECS Number: NC2975000

UN/NA & ERG Number: UN3290 (Toxic solid, corrosive, inorganic, n.o.s.)/154

EC Number: 232-259-2 [*Annex I Index No.:* 612-122-00-7]

Regulatory Authority and Advisory Information

United States EPA Gene-Tox Program, Positive: Cell transformation-RLV F344 rat embryo; 1988, Positive: N crassa-forward mutation; *S. pombe*-forward mutation; 1988, Negative: *In vitro* cytogenetics-human lymphocyte; 1988, Negative: D *melanogaster*-whole sex chrom. loss; 1988, Inconclusive: Carcinogenicity-mouse/rat; 1988, Inconclusive: *D. melanogaster*-nondisjunction; 1988, Inconclusive: *D. melanogaster* sex-linked lethal.

Hazard Alert: Poison, Explosive, Combustible, Corrosive, Sensitization hazard, Water reactive, Suspected reprotoxic hazard, Environmental hazard.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: E, Xn, N, Xi; risk phrases: R2; R21/22; R37/38; R40; R41; R43; R48/22; R62; safety phrases: S2; S26; S29/35; S36/37/39; S41; S61 (see Appendix 4).

Description: Hydroxylamine is a white crystalline substance. Molecular weight = 33.03; specific gravity (H_2O:1) = 1.23; boiling point = (decomposes) 56.5°C @22 mmHg; 70°C @60 mmHg; freezing/melting point = 33.05°C; it is very hygroscopic and unstable; vapor pressure = mmHg @ 10°C; flash point = 129.44°C (explosive); explosive limits: LEL = 18,000 ppm; UEL: unknown. Autoignition temperature = 129.44°C (reported to explode in temperatures >70°C[101]). NFPA-704 M Rating System): Health 2, flammability 0, reactivity 3₩. Soluble in water; reactive releasing heat and producing a corrosive alkaline liquid.

Potential Exposure: A potential danger to those involved in chemical synthesis or use of hydroxylamine. Used as a reducing agent.

Incompatibilities: Self-reactive. Contaminants, temperatures above 129.4°C (see also "Autoignition temperature" above), or open flame can cause explosive decomposition, especially in presence of moisture and carbon dioxide. Incompatible with strong acids; organic anhydrides; isocyanates, aldehydes, sodium, finely divided zinc; some metal oxides. Aqueous solution is a weak base. Contact with strong oxidizers may cause a fire and explosion hazard. Attacks some metals. Contact with calcium or zinc forms a heat-sensitive explosive [bis(hydroxylamide)][128].

Permissible Exposure Limits in Air

7803-49-8

PAC Ver. 29[138]

PAC-1: 0.35 milligram per cubic meter

PAC-2: 3.9 milligram per cubic meter

PAC-3: 23 milligram per cubic meter

DFG MAK: Danger of skin sensitization

Routes of Entry: Inhalation and ingestion of dust.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to skin, eyes, and mucous membranes. May cause methemoglobinemia. The effects may be delayed. Exposure can cause headache; vertigo (dizziness); tinnitus (ringing of ear); dyspnea (difficult breathing); nausea and vomiting, cyanosis, proteinuria and hematuria, jaundice, restlessness, and convulsion; yellowish brown deposit on conjunctiva and cornea; astigmatism; reddening of hair and exposed skin.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and eczema. May affect the nervous system. May cause anemia. May cause liver damage.
Points of Attack: Skin, blood, liver, nervous system.
Medical Surveillance: Annual physical exams including renal and hepatic. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. CBC. Examination of the nervous system.
First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Note to Physician:* Treat for methemoglobinemia. Test urine for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.
Storage: (1) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard (thermally unstable); Store separately in temperatures $<10°C$ in an area isolated from flammables, combustibles, or other yellow coded materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Protect against physical damage. Store in cool, noncombustible buildings and separate from oxidizing materials. Open airtight containers occasionally to relieve pressure from decomposition products.
Shipping: UN3290 Toxic solid, corrosive, inorganic, n.o.s., Hazard class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material.
Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Cover spill with sodium bisulfite and sprinkle with water. Collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Use extreme caution in approaching a fire. This thermally unstable material may explode when exposed to heat or flame. Thermal decomposition products may include oxides of nitrogen and sulfur. No attempt should be made to fight fires except for remotely activated fire extinguishing equipment. Evacuate the surrounding area. Water or foam may cause frothing. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Add sodium bisulfite solution and flush to sewer; or incinerate.

2-Hydroxypropyl Acrylate H:0510

Formula: $C_6H_{10}O_3$; $CH_2{=}CHCOOCH_2CHOHCH_3$
Synonyms: Acrylic acid 2-hydroxypropyl ester; HPA; Hydroxypropyl acrylate; β-Hydroxypropyl acrylate; 1,2-Propanediol 1-acrylate; Propylene glycol monoacrylate
CAS Registry Number: 999-61-1

HSDB Number: 7913
RTECS Number: AT1925000
UN/NA & ERG Number: UN2922 (Corrosive liquid, toxic, n.o.s.)/154; UN1760 (Corrosive liquids, n.o.s.)/154; UN2927/154
EC Number: 213-663-8 [*Annex I Index No.:* 607-108-00-2]
Regulatory Authority and Advisory Information
Hazard Alert: Poison, Flammable, Corrosive, Polymerization hazard (heat-sensitive), Sensitization hazard.
Hazard symbols, risk, & safety statements: Hazard symbol: F, C, T, Xi; risk phrases: R10; R23/24/25; R34; R36/37/38; R39; R40; R43; safety phrases: S16; S26; S36/37/39; S41; S45 (see Appendix 4)

Description: 2-Hydroxypropyl acrylate is a clear to light-yellow liquid with a sweetish, solvent odor. Molecular weight = 130.16; specific gravity (H_2O:1) = 1.05; boiling point = 191°C, also listed @ 195 and 205°C; Relative vapor density (air = 1) = 4.5; flash point = ~80°C; autoignition temperature = >200°C. Explosive limits: LEL = 1.8%; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: 2-Hydroxypropyl acrylate is used as a bifunctional monomer for acrylic resins; it is used as a binder in nonwoven fabrics and may be used in the production of detergent lube oil additives.

Incompatibilities: 2-Hydroxypropyl acrylate can polymerize due to heating, contact with initiators or UV light. It can become unstable at high temperatures and pressures; or, it may react with water with some release of energy. Reacts with oxidizers, strong acids; nitrates. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 5.33 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 0.5 ppm/3 milligram per cubic meter TWA [skin]
ACGIH TLV[1]: 0.5 ppm/2.8 milligram per cubic meter TWA [skin] danger of skin sensitization
PAC not available
DFG MAK: [skin] danger of skin sensitization
Australia: TWA 0.5 ppm (3 milligram per cubic meter) [skin], 1993; Belgium: TWA 0.5 ppm (2.8 milligram per cubic meter) [skin], 1993; Denmark: TWA 0.5 ppm (3 milligram per cubic meter) [skin], 1999; France: VME 0.5 ppm (3 milligram per cubic meter) [skin], 1999; Norway: TWA 0.5 ppm (2.9 milligram per cubic meter), 1999; Russia: STEL 1 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 0.5 ppm (2.7 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 3 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 ppm [skin], skin sensitizer. Several states have set guidelines or standards for hydroxypropyl acrylate in ambient air[60] ranging from 30 μ/m^3 (North Dakota) to 50 μ/m^3 (Virginia) to 60 μ/m^3 (Connecticut) to 71 μ/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms
Short-Term Exposure: The substance is corrosive to the eyes, the skin, and the respiratory tract. Eye contact can cause burns and permanent damage. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. LD_{50} (oral-rat) = 250 g/kg (moderately toxic).

Long-Term Exposure: Sensitization hazard. Repeated or prolonged contact with skin may cause dermatitis and eczema.

Points of Attack: Skin, lungs.

Medical Surveillance. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Lung function tests. Evaluation by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2922 Corrosive liquids, toxic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials. UN1760 Corrosive liquids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN2927 Toxic liquids, corrosive, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials., 8-Corrosive material, Technical Name Required.

Spill Handling: UN2927

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.6/1.0

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.0/1.50
Night 1.9/3/1

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal EPA for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Water may be ineffective. Use dry chemical, alcohol foam or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal of unused product must be undertaken by qualified personnel who are knowledgeable in all applicable regulations and follow all pertinent safety precautions including the use of appropriate protective equipment. For proper handling and disposal, always comply with federal, state, and local regulations.

Imazalil I:0075

Formula: $C_{14}H_{14}Cl_2N_2O$
Synonyms: Allyl-1-(2,4-dichlorophenyl)-2-imidazol-1-ylethyl ether; (±)1-(β-Allyloxy-2,4-dichlorophenethyl)imidazole; (±)-1-[β-(Allyloxy)-2,4-dichlorophenethyl]imidazole; 1-[2-(Allyloxy)-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole; Baytan IM; Bromazil imazalil; Caswell No. 497AB; Cerevax extra; Chloramizol; Clinafarm; Deccozil; 1-(2-(2,4-Dichlorophenyl)-2-(2-propenyloxy)ethyl)-1*H*-imidazole; 1-[2-((2,4-Dichlorophenyl)-2-propenyloxy)-ethyl]-1*H*-imidazole; Enilconazole; Fecundal 100EC; FF4961; FLO-PRO IMZ; Freshgard; Fungaflor; Imaverol; 1*H*-Imidazole, 1-[2-(2,4-dichlorophenyl)-2-(2-propenyloxy)ethyl]-; 1*H*-Imidazole, 1-[2-(2,4-dichlorophenyl)-2-(2-propenyloxy)ethyl]-, (±)-; Magnet; Mist-O-Matic liquid seed treatment; Nuzone; Raxil; RTU-Vitavax extra; R 23979; Vitavax extra
CAS Number: 35554-44-0
HSDB Number: 6672
RTECS Number: NI47760000
UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154
EC Number: 212-615-0 [*Annex I Index No.*: 613-042-00-5]
Regulatory Authority and Advisory Information
United States Environmental Protection Agency Carcinogens: Likely to be carcinogenic to humans.
California Proposition 65 Chemical[102]: Cancer 5/20/2011.
Hazard Alert: Poison, Combustible, Suspected reprotoxic hazard, Possible sensitization hazard (skin), Developmental toxin (TRI), Environmental hazard.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn, N; risk phrases: R45; R20/22; R41; R43; R50/53; R63; safety phrases: S1/2; S26; S29/35; S39; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: Yellow to brown wax-like, solidified oil or crystalline solid. Commercial products are in various forms including emulsifiable concentrate. Liquid formulations in organic solvents are combustible. Molecular weight = 297.18; freezing/melting point = 51−52°C; boiling point = (decomposes) 320−350°C (estimated); vapor pressure = 6.8×10^{-8} mmHg. Flash point = 191.5°C. Low to moderate solubility in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.
Potential Exposure: Imazalil is an imidazole derivative, systemic fungicide used on fruit, vegetables and ornamentals to control powdery mildew, black spot and other fungi. Also used as a seed dressing and for postharvest applications to bananas, citrus and other fruit. It has been shown that the use of imazalil is less likely to lead to resistant fungi strains than other fungicides.
Incompatibilities: Incompatible with oxidizers and alkaline materials. May react with mineral or clay based absorbents. Decomposes >250°C.
Determination in Air: No standards or Protective Action Criteria (PAC) available.
Determination in Water: Fish toxicity (threshold)[101]: Low—193.77060 ppb, MATC (Maximum Acceptable Toxicant Concentration)
Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or dermal contact
Incompatibilities: Strong oxidizers. Forms toxic fumes of nitrogen oxides and chlorine when heated to decomposition
Determination in Water: Octanol−water coefficient: Log K_{ow} = >3.5. Values above 3.0 are likely to bioaccumulate in marine organisms.
Routes of Entry: Eyes, dermal and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Causes eye irritation with pain. May cause skin and respiratory tract irritation. May cause nausea if ingested; toxic. Liver and kidney toxin. LD (oral, rat) = 250 mg/kg; LD_{50} (dermal, rat) = >4 g/kg.
Long-Term Exposure: May cause cancer and developmental problems. May cause liver and kidney problems. May cause skin sensitization. Human toxicity (long term)[101]: Intermediate—17.50 ppb, Health Advisory.
Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. If skin sensitization is suspected, consider evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Liver and kidney function tests. Comprehensive physical examination with emphasis on the genito-urinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be carried out if, in the opinion of a physician, they are indicated.
First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00009-0

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.

with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full facepiece self-contained breathing apparatus (SCBA); or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical resistant suit.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA -or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA). May react with mineral or clay based absorbents.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition (heated >285°C) products include hydrogen chloride and oxides of nitrogen and carbon. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire*: Dry chemical, carbon dioxide or water spray. *Large fire*: dry chemical, carbon dioxide, alcohol-resistant foam or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Imazethabenz-methyl I:0078

Formula: $C_{16}H_{20}N_2O_3$

Synonyms: Assert; Benzoic acid, 2-(4,5-dihydro-4-methyl-4-(1-methylethyl)-5-xox-1*H*-imidazol-2-yl)-4 (or 5)-methyl-, methyl ester; Dagger; 2[4,5-Dihydro-4-methyl-4-(1-methylethyl)-5-*oxo*-1*H*-imidazol-2-yl]-4 (or 5)-methylbenzoic acid methyl ester; Imazamethabenz; Methyl 6-(4-isopropyl-4-methyl-5-*oxo*-2-imidazolin-2-yl)-*m*-toluate); (Methyl 6-(4-isopropyl-4-methyl-5-*oxo*-2-imidazolin-2-yl)-*m*-toluate plus Methyl 6-(4-isopropyl-4-methyl-5-*oxo*-2-imidazolin-2-yl)-m-toluate); *m*-(or *p*-)Toluic acid, 6-(4-isopropyl-4-methyl-5-*oxo*-2-imidazolin-2-yl)-, methyl ester; *m*-(or *p*-)Toluic acid, 2-(4,5-dihydro-4-methyl-4-isopropyl-5-*oxo*-1*H*-imidazol-2-yl)-, methyl ester

CAS Number: 81405-85-8

HSDB Number: 6675

RTECS Number: DG8576140

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: Not assigned

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group D, Not classifiable as a human carcinogen

Description: White or slightly yellow powder. Musty odor. Molecular weight = 288.33; specific gravity (H_2O:1) = 0.33 @ 20°C; freezing/melting point = 133–145°C; vapor pressure = 1.2×10^{-8} mmHg @ 25°C; flash point = 91°C. Soluble in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Imidazolinone herbicide generally used as a herbicide on small grain crops. Actively registered for use in the United States Not registered for use in EU, as imazamethabenz.

Incompatibilities: Incompatible with oxidizers, chlorates nitrates, peroxides; and alkaline materials. Strongly acidic, a corrosive material; may attack some metals, including aluminum and steel, and some coatings, especially in the presence of moisture.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—515.35916 ppb, MATC

Harmful Effects and Symptoms

Short-Term Exposure: May cause irritation to the eyes, skin, or respiratory tract. High levels may cause permanent eye damage. May be toxic if ingested or absorbed through the skin. LD_{50} (oral, rat) = > 5 g/kg.; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: Human toxicity (long term)[101]: Very low—441.00 ppb, Health Advisory.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4–6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH-approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m (1/2 mi) in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine if a discarded chemical is classified as a hazardous waste. See 40 CFR Parts 261.3 for United States Environmental Protection Agency guidelines for the classification determination. Additionally, in order to ensure complete and accurate classification, waste generators must consult state and local hazardous waste regulations.

Imazaquin I:0084

Formula: $C_{17}H_{17}N_3O_3$; $C_{17}H_{20}N_4O_3$(ammonium salt)

Synonyms: 2-[4,5-Dihydro-4-methyl-4-(1-methylethyl)-5-*oxo*-1*H*-imidazol-2-yl]-3-quinolinecarboxylic acid; Quinolinecarboxylic acid, 2-(5-isopropyl-5-methyl-4-*oxo*-2-imidazolin-2-yl)-; 3-Quinolinecarboxylic acid, 2-[4,5-dihydro-4-methyl-4-(1-methylethyl)-5-*oxo*-1*H*-imidazol-2-yl]-*ammonium salt*: AC 252,214; Ala-Scept; Ammonium imazaquin; Backdraft; CL 252,214; Detail; 2-(4,5-dihydro-4-methyl-4-(1-methylethyl)-5-*oxo*-1*H*-imidazol-2-yl)-3-quinolinecarboxylic acid monoammonium salt; Image herbicide consumer concentrate (ammonium salt); Meteor; Mon-9850; Partner imazaquin; Scepter; Squadron (with pendimethalin); Tri-Scept; Upright

CAS Number: 81335-37-7

HSDB Number: 6677

RTECS Number: VB2009800

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Agricultural chemical.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R21; safety phrases: S29/35; S36; S41; S41 (see Appendix 4)

Description: A gray crystalline solid. Commercial products available as a concentrated liquid. Pungent odor. Molecular weight = 311.337; 328.27 (ammonium salt); boiling point = (decomposes); freezing/melting point = 220°C; 219−224°C (ammonium salt); vapor pressure = 7×10^{-9} mmHg @ 25°C. Soluble in water; solubility = 100 mg/L. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Imazaquin is an imidazolinone plant growth regulator selective, preemergence and postemergence herbicide used to control grasses and broadleaf weeds. It is used on corn, wheat, soybeans, turf and ornamentals.

Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Mixture with some silver compounds forms explosive salts of silver oxalate. Decomposes in temperatures $>240°C$.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log K_{ow} = negative. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—61926.11430 ppb, MATC.

Harmful Effects and Symptoms

Short-Term Exposure: May cause irritation to the eyes, skin, or respiratory tract. May be toxic if ingested or absorbed through the skin. LD_{50} (oral, rat) = 5 g/kg.; LD_{50} (dermal, rat) = >2 g/kg.

Long-Term Exposure: Human toxicity (long term)[101]: Very low—1750.00 ppb, Health Advisory

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4−6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH-approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Fire involving storage or vehicular tanks: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. On a small fire: use dry chemical, CO_2, water spray or regular foam. On a large fire: use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. Fire involving tanks: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods.

Regulatory Authority and Advisory Information
Carcinogenicity[83]: EPA, Not likely to be carcinogenic to humans.
Potential Ground water Pollutant [California FAC Section 13145(d)/12811, inactive; ammonium salt is active)
Description: Colorless to slightly yellowish crystalline solid. Pungent odor. Molecular weight = 289.33; specific gravity (H_2O:1) = 1.11; boiling point = (decomposes); freezing/melting point = 173 °C. Highly soluble in water; solubility = 1.42×10^3 mg/L.
Potential Exposure: Imazethapyr is an imidazolinone, general use, selective preemergence herbicide that is used to control grasses and broadleaf weeds on a variety of field and vegetable crops including dry and edible beans, peas, soybeans, peanuts, alfalfa, and corn.
Incompatibilities: May react violently with strong oxidizers, bromine, 90% hydrogen peroxide, phosphorus trichloride, silver powders or dust. Incompatible with silver compounds. Corrosive to zinc, mild steel, brass, copper and aluminum. Mixture with some silver compounds forms explosive salts of silver oxalate
Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.
Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—52267.57728 ppb, MATC
Harmful Effects and Symptoms
Short-Term Exposure: May cause irritation to the eyes, skin, or respiratory tract. May be toxic if ingested or absorbed through the skin. LD_{50} (oral, rat) = > 5 g/kg; (dermal, rat) = > 2 g/kg; (inhalation, rat) = 3.27 mg/L[83].
Long-Term Exposure: Human toxicity (long term)[101]: Very low—1750.00 ppb, Health Advisory.
Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Imidacloprid I:0092

Formula: $C_9H_{10}ClN_5O_2$

Synonyms: Admire; 1-[(6-Chloro-3-pyridinyl)methyl]-*N*-nitro-2-imidazolidiniminebenzoate; 1-[(6-Chloro-3-pyridinyl)methyl]-4,5-dihydro-*N*-nitro-1*H*-imidazol-2-amine; 1-(2-Chloro-5-pyridylmethyl)-2-(nitroamino)imidazolidine; Confidor 2.5% granular; Confidor 2% flowable; Encore; Gaucho; Imicide; 1*H*-Imidazol-2-amine, 1-[(6-chloro-3-pyridinyl)methyl]-4,5-dihydro-*N*-nitro-; 2-Imidazolidinimine, 1-[(6-chloro-3-pyridinyl)methyl]-*N*-nitro-benzoate; Leverage; Marathon; Merit ntn 33893; Premier; Premise; Prescribe; Protreat; Provado; Trimax

CAS Number: 138261-41-3; 105827-78-9

HSDB Number: 7373

RTECS Number: NJ0560000

UN/NA & ERG Number: UN2588 (Pesticides, solid, toxic, n.o.s.)/151; UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 428-040-8 [*Annex I Index No.*: 612-252-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Environmental hazard.

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, N; risk phrases: R22; R50/53; safety phrases: S2; S22; S29/35; S41; S57; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Colorless (when pure) to off-white crystalline solid Slight characteristic odor. The commercial product is often water soluble granules. Molecular weight = 255.7; specific gravity (H_2O:1) = 1.55 @ 25°C; boiling point = (decomposes); freezing/melting point = 145°C; vapor pressure = 5×10^{-12} mmHg @ 25°C. Highly soluble in water; solubility = 600 mg/L. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Neonicotinoid/chloronicotinyl insecticide. Effective 12/1/2013, A two-year ban and severe restriction the use of neonicotinoids for seed treatment, soil application (granules) and foliar treatment on bee attractive plants and cereals. One of the most heavily used pesticide in the world. A systemic insecticide used to control sucking insects in the soil, seeds and foliar environments. It is one of the most-used pesticides in the world and has a broad variety of both agriculture and nonagricultural uses, including on pets and household environments. Used on rice, cereals, maize, vegetables, fruit, sugar beets, potatoes, cotton, hops, and turf. It is related to nicotine and acts on the nervous system. A United States Environmental Protection Agency Restricted Use Pesticide (RUP).

Incompatibilities: Combustible solid. Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Decomposes in temperatures above 225°C.

Permissible Concentration in Water: Federal Drinking Water Guidelines: 400 ppb[14].

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 0.6$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—1199.99656 ppb, MATC.

Routes of Entry: Dermal contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Causes labored breathing. *Ingestion*: May cause convulsions, vomiting, diarrhea. May attack central nervous system causing apathy, incoordination. LD_{50} (oral, rat) = 450−500 mg/kg; (dermal, rat) = > 5 g/kg.

Long-Term Exposure: May affect the central nervous system. Human toxicity (long term)[101]: Very low—399.00 ppb, Health Advisory.

Points of Attack: Central nervous system, lungs, digestive system.

Medical Surveillance: Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d)(4−6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH-approved SCBA and full protective clothing.

Respirator Selection: Where the neat (undiluted) test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e. organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO_2 and a high efficiency particulate filter)[88]

Storage: Color code—Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2588 Pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon and hydrogen chloride gas. This chemical is combustible; it may burn but does not easily ignite. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for

firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. If this material cannot be disposed of according to label instructions, it may be dissolved or mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Indene I:0100

Formula: $C_9H_2O_8$; $CH = CHCH = CHC = CCH = CHCH_2$

Synonyms: IH-Indene; Indonaphthene

CAS Registry Number: 95-13-6

HSDB Number: 5286

RTECS Number: NK8225000

UN/NA & ERG Number: UN/NA1993 (Combustible/flammable liquid, n.o.s.)/128. Only regulated when shipped in bulk. UN3295

EC Number: 202-393-6

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Poison, Polymerization hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R19; R65; safety phrases: S23; S24/25; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Indene is a colorless liquid from coal tars. The odor threshold is 0.015 ppm. Molecular weight = 116.16; specific gravity (H_2O:1) = 0.997; boiling point = 182 °C; freezing/melting point = −1.5°C; vapor pressure = 0.75 mmHg@ 12°C; flash point = 50°C; −2.0°C[101]. Hazard Identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 1. Practically insoluble in water.

Potential Exposure: Indene is used in the preparation of synthetic resins, such as coumarone indene resins. It is also used as an organic intermediate. It is an asphalt and naphtha constituent; from petroleum refining and coke processing.

Incompatibilities: Vapor may form explosive mixture with air. Contact with strong oxidizers; strong acids may cause fire and explosion hazard. Polymerizes and oxidizes on standing. Sunlight can cause polymerization. It has exploded during nitration with sulfuric acid + nitric acid.

Permissible Exposure Limits (PELs) in Air

Conversion factor: 1 ppm = 4.75 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 10 ppm/45 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/24 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 15 ppm

PAC-2: 22 ppm

PAC-3: 130 ppm

Australia: TWA 10 ppm (45 milligram per cubic meter), 1993; Belgium: TWA 10 ppm (48 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (45 milligram per cubic meter), 1999; Finland: TWA 10 ppm (47 milligram per cubic meter); STEL 20 ppm (95 milligram per cubic meter), 1999; France: VME 10 ppm (45 milligram per cubic meter), 1999; Norway: TWA 10 ppm (45 milligram per cubic meter), 1999; Switzerland: MAK-W 10 ppm (45 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 45 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 10 ppm. Several states have set guidelines or standards for indene in ambient air[60] ranging from 450−700 μ/m^3 (North Dakota) to 750 μ/m^3 (Virginia) to 900 μ/m^3 (Connecticut) to 1,071 μ/m^3 (Nevada).

Determination in Air: No method listed. The following are used for coal tar products: OSHA Analytical Method 58. See also NIOSH Analytical Method #5506 by HPLC; #5515 by GC.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 621 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: May cause eye, skin, and respiratory irritation. Animal studies have shown that liver damage and occasionally, spleen and kidney injury result from exposure to high (800−900 ppm) vapor concentrations. Liquid indene defatted the skin but did not cause dermatitis. Aspiration of liquid into the lung caused pneumonitis, pulmonary edema and hemorrhage in laboratory animals.

Long-Term Exposure: May cause skin sensitization and allergy. Has caused liver, kidney, and spleen injury in laboratory animals.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, spleen.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Examination by a qualified allergist to diagnose skin allergy. Medical surveillance shall be made available, as specified below, to all employees occupationally exposed to coal tar products. *Preplacement Medical Examinations*: These examinations shall include: Comprehensive initial medical and work histories, with special emphasis directed toward identifying preexisting disorders of the skin; respiratory tract; liver, and kidneys. A physical examination giving particular attention to the oral cavity, skin, and respiratory system. This shall include posteroanterior and lateral chest X-rays (35 × 42 cm). Pulmonary function tests, including forced vital capacity (FVC) and forced expiratory volume @ 1 second (FEV 1.0); and a sputum cytology examination shall be offered as part of the medical examination of exposed employees. Other tests, such as liver function and urinalysis, should be performed as considered appropriate by the responsible physician. In addition, the mucous membranes of the oral cavity should be examined. A judgment of the employee's ability to use positive pressure respirators. *Periodic Examinations*: These examinations shall be made available at least annually and shall include: Interim medical and work histories. A physical examination as outlined above. *Initial Medical Examinations*: These examinations shall be made available to all workers as soon as practicable after the promulgation of a standard based on these recommendations. *Pertinent Medical Records*: These records shall be maintained for at least 30 years after termination of employment. They shall be made available to medical representatives of the government, the employer or the employee.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 10* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a powered-air purifying respirator. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3295 Hydrocarbons, liquid, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid. UN1993

Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required. NA1993 Combustible liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required. (Domestic U.S.). Only regulated when shipped in bulk as a Class 3 combustible liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Indene is a flammable liquid. Thermal decomposition products may include oxides of carbon. Extinguish fire using an agent suitable for type of surrounding fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence, Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1997; NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies. Handle with caution as several related polynuclear aromatic hydrocarbons are known carcinogens. NIOSH has recommended that coal tar pitch volatiles, including polycyclic aromatic hydrocarbons (PAHs) be treated as potential human carcinogen. United States Environmental Protection Agency Gene-Tox Program, Positive: Carcinogenicity-mouse/rat.

California Proposition 65 Chemical[102]: Cancer 1/1/1988.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected reprotoxic hazard.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 307(a)(1) Toxic pollutant designated, pursuant to of the and is subject to effluent limitations as polycyclic aromatic hydrocarbons (PAHs)

United States National Primary Drinking Water Regulations: MCLG = zero mg/L; MCL = 0.0002 mg/L as polycyclic aromatic hydrocarbons (PAHs).

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U139

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.0055; Nonwastewater (mg/kg), 3.4

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8100 (200); 8270 (10)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N, Xn; risk phrases: R45; R38; R39/23/24/29; R40; R60; R61; R62; R65; R67; safety phrases: S7; S16; S36/37; S45; S53; S60; S61; S62 (see Appendix 4)

Description: Indeno(1,2,3-*c*,*d*)pyrene is a yellow crystalline solid. Polycyclic aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polynuclear aromatic hydrocarbons. Molecular weight = 276.34; boiling point = 536 °C; freezing/melting point = 162.5−164°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: Found in internal combustion engine exhausts; cigarette smoke condensate; soot, coal tar pitch.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

PELs in Air

NIOSH IDLH = 80 milligram per cubic meter as coal tar pitch volatiles

OSHA PEL: 0.2 milligram per cubic meter TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 milligram per cubic meter (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA (as benzene soluble aerosol); Confirmed Human Carcinogen

PAC Ver. 29[138]

PAC-1: 1.2 milligram per cubic meter

PAC-2: 13 milligram per cubic meter

PAC-3: 79 milligram per cubic meter

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2 Austria: carcinogen, 1999; France: carcinogen, 1993

Determination in Air: Use NIOSH Analytical Method #5506 polycyclic aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polycyclic aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: For the maximum protection of human health from the potential carcinogenic effects due to exposure of polynuclear aromatic hydrocarbons through ingestion of contaminated water and contaminated aquatic organisms, therefore, the levels which may result in incremental increase of cancer risk over the lifetime are estimated at 1×10^{-5}, 1×10^{-6}, and 1×10^{-7}. The corresponding criteria are 28.0, 2.8, and 0.28 ng/L, respectively. If the above estimates are made for consumption of aquatic organisms only, excluding consumption of water, the levels are 311.0, 31.1, and 3.11 ng/L respectively.

Determination in Water: Methylene chloride extraction followed by high performance liquid chromatography (HPLC); with fluorescence or UV detection; or gas chromatography (EPA Method 610; by gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{\text{ow}} = > 6$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Ingestion, inhalation eye and/or skin contact.

Harmful Effects and Symptoms

Long-Term Exposure: May be carcinogenic in humans. Repeated exposure may cause dermatitis, bronchitis. Indeno(1,2,3-*cd*)pyrene is a complete carcinogen and an initiator for skin carcinogenesis in the mouse. Subcutaneous injections in mice produce local sarcomas.

Points of Attack: Respiratory system, skin, bladder, kidneys. Cancer site for coal tar pitch volatiles is lung, kidney and skin cancer.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Medical surveillance shall be made available, as specified below, to all employees occupationally exposed to coal tar products. *Preplacement Medical Examinations*: These examinations shall include: Comprehensive initial medical and work histories, with special emphasis directed toward identifying preexisting disorders of the skin; respiratory tract; liver, and kidneys. A physical examination giving particular attention to the oral cavity, skin, and respiratory system. This shall include posteroanterior and lateral chest X-rays (35 × 42 cm). Pulmonary function tests, including FVC and forced expiratory volume @ 1 second (FEV 1.0); and a sputum cytology examination shall be offered as part of the medical examination of exposed employees. Other tests, such as liver function and urinalysis, should be performed as considered appropriate by the responsible physician. In addition, the mucous membranes of the oral cavity should be examined. A judgment of the employee's ability to use positive pressure respirators. *Periodic Examinations*: These examinations shall be made available at least annually and shall include: Interim medical and work histories. A physical examination as outlined above. *Initial Medical Examinations*: These examinations shall be made available to all workers as soon as practicable after the promulgation of a standard based on these recommendations. *Pertinent Medical Records*: These records shall be maintained for at least 30 years after termination of employment. They shall be made available to medical representatives of the government, the employer or the employee.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with IP all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. IP itself burns only with difficulty. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Indeno(1,2,3-*cd*)pyrene may be destroyed by permanganate oxidation; by high-temperature incineration with scrubbing equipment or by microwave plasma treatment. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazard Alert: (chloride), Suspected of causing genetic defects, Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. (all indium compounds).

Hazard symbols, risk, & safety statements: Hazard symbol: C, F, Xn, Xn; risk phrases: R11; R20/21/22; R25; R26; R34; R36/37/38; S41; R60; R61 R62; R63; safety phrases: S9; S16; S26; S28; S36/37/39; S41; S45 (see Appendix 4)

Description: Indium metal, In, is malleable, ductile, shiny, and softer than lead. May be found as a white or gray powder. Indium sulfate is a grayish-white, hygroscopic powder. Soluble in water. The two most important indium compounds are the oxide and sulfate. Indium, elemental unless otherwise specified: Molecular weight = 114.82 (elemental); 221.17 (trichloride); 277.64 (oxide); 245.64 (oxide vapor); 517.82 (sulfate); specific gravity 7.31 @ 20°C (elemental); 7.18 @ 20°C (oxide); 4 @ 20°C (trichloride); 3.44 (sulfate); boiling point = 2080°C (elemental); 600°C (trichloride); freezing/melting point = 156°C (elemental); 1913 (oxide). Insoluble in water. Explosive limits: LEL = 10,000 ppm; UEL: unknown. (sulfate). Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Finely divided indium forms hydroxide on contact with water.

Potential Exposure: Indium and its compounds are used as a dental alloy; used to make high quality solders and braze-bonded connectors; in automotive bearings (Europe only); in low-pressure sodium lamps (Europe). Also used in nuclear reactor control rod alloys; catalysts; indium oxide fuel cells; cryogenic gasket material. Indium oxide is used in coloring glass: a light to dark brown can be obtained, depending on the amount used. Indium sulfate is used in electroplating to prepare sulfate electrolytes. Radioisotopes of indium and indium compounds are also used for medical treatment of cancer and diagnostic organ scanning.

Incompatibilities: Not flammable in bulk; however, dust or powdered form may ignite when dispersed in air. Violent reaction with acetonitrile, dinitrogen tetroxide, mercury(II) bromide (at 350°C), sulfur (mixtures ignite when heated). Oxidizes readily at higher temperatures. Keep away from oxidizers.

PELs in Air

OSHA PEL: None

PAC-3: 46 milligram per cubic meter

Determination in Air: NIOSH II(5) Method #7303, P&CAM #173; OSHA Analytical Method ID-121

Determination in Water: Neutron activation has been used to analyze for indium in seawater. The detection limit is 0.006 ng/L. Polarography has also been used to determine indium in water with a detection limit of 1.0 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Indium can affect you when breathed in. Contact can irritate the skin and eyes. Exposure to high levels may damage the kidneys and liver. Indium can irritate the lungs and may cause permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Possible liver, kidney, heart, blood effects (NIOSH). Indium may damage the developing fetus. May damage the lungs.

Points of Attack: Irritation of eyes, skin, respiratory system; possible liver, kidney, heart, blood effects.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests, complete blood count (CBC). Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for Exposures over *0.1 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Bulk quantities of indium *powder* are pyrophoric and require a Red Code. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where powder or dust may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from mineral acids and sulfur. Where possible, automatically transfer from drums or other storage containers to process containers.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and nonsparking tools when cleaning up powder and dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include metal oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Extinguish fire using an agent suitable for type of surrounding fire. Indium itself does not burn, but indium powder and dust is flammable and may ignite when exposed to heat or flame. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Indium and its compounds are rated moderately toxic. Recovered indium has a recycled value, so a minimum quantity is discarded. Closed containers are required for the disposal of indium and its compounds. The environmental hazard from indium appears to result from the use and disposal of radioactive isotopes and not chemical toxicity.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, High acute toxicity, Suspected of causing genetic defects, Environmental hazard.

FDA-over the counter drug

List 1, DEA chemical code 6699 (Title 21 CFR1310.02)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.; Class E.

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn, N; risk phrases: R20/21; R51; R62; safety phrases: S2; S23; S25; S29/35; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters.

Description: Iodine is a blue-black or violet solid with a sharp, characteristic odor. Molecular weight = 253.81; specific gravity (H_2O:1) = 4.93; boiling point = 184.4°C; freezing/melting point = 114°C; vapor pressure = 0.75 mmHg @ 36°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Practically insoluble in water; solubility = 0.01%.

Potential Exposure: Iodine is used as a as a drinking water disinfectant; in the manufacture of organic chemicals, especially pharmaceuticals; as a catalyst in organic reactions. It is used in the manufacture of silver iodide for use in photography.

Incompatibilities: Contact with ammonia forms a shock-sensitive compound which will explode, causing fires. A powerful oxidizer. Violent reaction with reducing agents; combustibles, acetylene, acetaldehyde, antimony, cesium, francium, lithium, potassium, powdered metals; rubidium, phosphorous, sodium, sulfur.

Arab Republic of Egypt: TWA 0.1 ppm (0.1 milligram per cubic meter), 1993; Australia: TWA 0.1 ppm (1 milligram per cubic meter), 1993; Austria: MAK 0,1 ppm (1 milligram per cubic meter), 1999; Belgium: STEL 0.1 ppm (1 milligram per cubic meter), 1993; Denmark: TWA 0.1 ppm (1 milligram per cubic meter), 1999; Finland: STEL 0.1 ppm (1 milligram per cubic meter) [skin], 1999; France: VLE 0.1 ppm (1 milligram per cubic meter), 1999; the Netherlands: MAC 1 milligram per cubic meter, 2003; Japan: 0.1 ppm (1 milligram per cubic meter), 1999; Norway: TWA 0.1 ppm (1 milligram per cubic meter), 1999; the Philippines: TWA 0.1 ppm (1 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 milligram per cubic meter, 1999; Russia: TWA 0.1 ppm; STEL 1 milligram per cubic meter [skin], 1993; Sweden: ceiling 0.1 ppm (1 milligram per cubic meter), 1999; Switzerland: MAK-W 0.1 ppm (1 milligram per cubic meter), KZG-W 0.2 ppm, 1999; Thailand: TWA 0.1 ppm (1 milligram per cubic meter), 1993; Turkey: TWA 0.1 ppm (1 milligram per cubic meter), 1993; United Kingdom: STEL 0.1 ppm (1.1 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.1 ppm. Several states have set guidelines or standards for iodine in ambient air[60] ranging from $8\ \mu/m^3$ (Virginia) to $10\ \mu/m^3$ (North Dakota) to $20\ \mu/m^3$ (New York) to $24\ \mu/m^3$ (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6005; OSHA Analytical Method ID-212. See also OSHA Analytical Method ID-177.

Permissible Concentration in Water: Maine[61] has set a guideline for iodine in drinking water of 340 μg/L.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 2.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Iodine irritates the eyes, skin, and respiratory tract. *Note*: Individuals with thyroid, lung and kidney disease should consult a physician before working with iodine. *Inhalation*: May cause some irritation at a concentration of 0.1 ppm. However, work is difficult at 0.15–0.2 ppm, and impossible at 0.3 ppm. Concentrations of 1 ppm are highly irritating. Iodine vapor can severely irritate eyes, nose, and throat; action of iodine is similar to that of chlorine, but is more irritating to lungs. Leads to tearing, tightness in the chest; sore throat and headache. Painful cough and difficult breathing may continue for several weeks following severe exposure. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin*: Solid, vapor or iodine solution can stain, irritate, damage and penetrate the skin. May produce symptoms similar to those under inhalation. *Eyes*: A concentration of 0.57 ppm for five minutes was reported to cause eye irritation. Irritation was experienced within 2 minutes @ 1.63 ppm. Contact with saturated vapor for 3−4 minutes caused brown staining and subsequent loss of outer layer of the cornea, followed by complete healing in 2−3 days. *Ingestion*: Small doses of iodine preparations produce salivation, excessive tearing; swelling of eyelids; soreness and swelling of salivary glands; metallic taste; skin rash; fever and enlarged lymph glands. Larger doses cause severe vomiting, diarrhea, abdominal pain; thirst, shock, fever, total suppression of urine; delirium, stupor and death. Ingestion of 1 mL (1/30 fluid ounce) of tincture of iodine or 1 g (1/30 oz) of iodine crystals results in similar symptoms including giddiness, faintness, pallor, rapid and feeble pulse; excitement and convulsions; collapse and unconsciousness. Fatal dose for an adult is about 1/15 oz. Some individuals may be more susceptible than others.

Long-Term Exposure: Prolonged exposure to iodine or compounds leads to iodism and deficiency of thyroid hormone. Since iodine or iodine compounds are potent sensitizers, repeated contact may be followed by rash, swelling of the vocal cords; severe generalized allergic reaction; and joint pain and swelling.

Points of Attack: Eyes, skin, respiratory system; central nervous system; cardiovascular system

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests: FVC, forced expiratory volume (1 second). If symptoms develop or overexposure is suspected, the following may be useful: thyroid function tests, liver function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: *Solid*: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours**: Saranex coated suits. **4 hours**: polyethylene gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Liquid*: Avoid skin contact with liquids of >7% content or repeated or prolonged contact with liquids of <7% content. Wear eye protection to prevent any possibility of eye contact with liquids of >7% iodine content. Employees should wash immediately with soap when skin is wet or contaminated with liquids of >7% content. Remove nonimpervious clothing immediately if wet or contaminated with liquids containing >7% and promptly remove if liquid contains <7% iodine. Provide emergency showers and eyewash if liquids containing >7% contaminants are involved.

Respirator Selection: *up to 1 ppm*: Sa* (APF = 10) (any supplied-air respirator). *Up to 2 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Iodine must be stored to avoid contact with aqueous ammonia, acetylene, acetaldehyde, powdered aluminum; or chemically active metals (such as potassium, sodium, magnesium, and zinc); since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above.

Shipping: UN3495 Iodine, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials. UN1759 Corrosive solids, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required.

Spill Handling: *Solid*: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources.

Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid*: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include iodine vapors. Extinguish fire using an agent suitable for type or surrounding fire. Iodine itself does not burn. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: React with large volumes of reducing agent (hypo- or bisulfites or ferrous salts) solution, neutralize and flush to sewer with water. Alternatively, iodine may be recovered from various process waste streams.

Iodine Monochloride I:0150

Formula: ClI; ICl

Synonyms: Iodine chloride; Iodochlorine; Protochlorure diode (French); Wijs' chloride

CAS Registry Number: 7790-99-0

HSDB Number: 601

RTECS Number: NN1650000

UN/NA & ERG Number: UN1792 (solid)/157; UN3498 (liquid)/157

EC Number: 232-236-7

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl$^-$]/L as Chloride Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R8; R21; R22; R34; R35; R36/37/38; safety phrases: S23; S26; S36/37/39; S41; S45 (see Appendix 4)

Description: Iodine monochloride is a black crystalline solid or reddish brown liquid. Molecular weight = 162.38; boiling point = 97.4°C and decomposes @ 100°C; freezing/melting point = 27°C (α-form); 14°C (β-form). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 3₩. Soluble in water.

Potential Exposure: This material is used as a chemical reagent.

Incompatibilities: A strong oxidizer. Reacts with air, forming iodine pentoxide; heat may cause explosions. Violent reaction with water, steam, and other forms of moisture (forming toxic and corrosive fumes); organic matter; aluminum foil; cadmium sulfide, hydrides, lead sulfide; metal powders, phosphorus, phosphorus trichloride; potassium, reducing agents, rubber, silver sulfide; sodium, zinc sulfide, and other metals. Handle and store under nitrogen.

PELs in Air

PAC not available

No occupational exposure limits have been established for this iodine compound. This does not mean that this substance is not harmful. Safe work practices should always be followed. However, because this chemical can release iodides and iodine gas, the OSHA PEL of 0.1 ppm for iodine should not be exceeded at any time.

Determination in Air: Use NIOSH Analytical Method (IV) #6005.

Harmful Effects and Symptoms

Short-Term Exposure: Iodine monochloride is a corrosive chemical and exposure can severely irritate, and may burn, the eyes, skin, nose, throat and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Irritates the lungs. Repeated exposure may cause bronchitis.

Points of Attack: Lungs.

Medical Surveillance: NIOSH lists the following tests for iodine: chest X-ray; pulmonary function tests: FVC, forced expiratory volume (1 second).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as iodine): *up to 1 ppm*: Sa (APF = 10) (any supplied-air respirator).* *Up to 2 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Yellow Stripe (strong oxidizer): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Should be handled and stored under nitrogen. Iodine monochloride must be stored to avoid contact with aluminum foil, cadmium sulfide; lead sulfide; organic matter; phosphorus, phosphorus trichloride; potassium, rubber, silver sulfide; sodium, zinc sulfide, and other metals, since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where iodine monochloride is used, handled, or stored a manner that could create a potential fire or explosion hazard. It also reacts with water or steam, producing toxic and corrosive fumes. If iodine monochloride is heated to decomposition (100°C), it gives off poisonous chlorine and iodine gases, and may explode.

Shipping: UN1792 Iodine monochloride, solid, Hazard class: 8; Labels: 8-Corrosive material. UN3498 Iodine monochloride, liquid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: *Solid*: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid*: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Iodine monochloride may burn, but does not readily ignite. *Do not use water* as poisonous gases are produced. Use dry chemical, CO_2, or foam extinguishers. If iodine monochloride is heated to decomposition (100°C), it gives off poisonous chlorine, hydrogen iodide and may explode. Containers may explode in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, "Hazardous Substance Fact Sheet: Iodine monochloride, Trenton, NJ (August 1999).

Iodoform I:0180

Formula: CHI_3

Synonyms: Methane, triiodo-; NCI-C04568; Triiodomethane

CAS Registry Number: 75-47-8

HSDB Number: 4099

RTECS Number: PB7000000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 200-874-5

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Possible risk of forming tumors, Mutagen.

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Iodoform is a bright yellow or greenish-yellow crystalline solid. Disagreeable, pungent odor. The odor threshold is 0.005−1.1 ppm; 0.4 ppb[193]. Molecular weight = 393.72; specific gravity (H_2O:1) = 4.01; boiling point = (decomposes) 210°C; freezing/melting point = 119°C. It is nonflammable. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1 ₩. Water reactive; practically insoluble; solubility = 0.1%.

Potential Exposure: Iodoform has been used as a topical antiinfective and in veterinary medicine as an antiseptic and disinfectant for superficial lesions.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from water, alkaline materials, strong acids. Reacts violently with strong oxidizers, strong bases, metal powders, fluorine, lithium, acetone, balsam, metallic salts (e.g., mercuric oxide, silver nitrate), hexamethylenetetramine, calomel, tannin. Violent reaction with steam. Decomposes in heat and light.

PELs in Air

Conversion factor: 1 ppm = 16.10 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.6 ppm/10 milligram per cubic meter TWA

ACGIH TLV[1]: 0.6 ppm/10 milligram per cubic meter TWA

PAC not available

Australia: TWA 0.6 ppm (10 milligram per cubic meter), 1993; Belgium: TWA 0.6 ppm (10 milligram per cubic meter), 1993; Denmark: TWA 0.2 ppm (3 milligram per cubic meter), 1999; France: VME 0.6 ppm (10 milligram per cubic meter), 1999; Norway: TWA 0.2 ppm (3 milligram per cubic meter), 1999; Switzerland: MAK-W 0.6 ppm (10 milligram per cubic meter), 1999; United Kingdom: TWA 0.6 ppm (9.8 milligram per cubic meter); STEL 1 ppm, 2000; the Netherlands: MAC-TGG 3 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.6 ppm. Several states have set guidelines or standards for iodoform in ambient air[60] ranging from $100\ \mu/m^3$ (North Dakota) to $160\ \mu/m^3$ (Virginia) to $200\ \mu/m^3$ (Connecticut) to $238\ \mu/m^3$ (Nevada).

Determination in Air: No method available.

Determination in Water: No method available.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Iodoform can affect you when breathed in and by passing through your skin. Irritates the eyes. A generalized allergic reaction, with fever and rash, sometimes occurs. Exposure to very high levels may cause nervous system effects, such as confusion, irritability, and/or poor muscle coordination. Iodoform may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash. High exposures may damage the liver and kidneys.

Long-Term Exposure: Repeated or prolonged contact with skin may cause allergy. May cause liver, kidney, heart damage; visual disturbance.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, heart.

Medical Surveillance: NIOSH lists the following tests for iodine: chest X-ray; pulmonary function tests: FVC, forced expiratory volume (1 second). If symptoms develop or overexposure is suspected, the following may be useful: skin testing with dilute iodoform may help diagnose allergy, if done by a qualified allergist. Liver and kidney function tests. EKG.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way* *valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 0.6* ppm; Use an NIOSH/MSHA or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use an NIOSH/MSHA or European Standard EN 149-approved supplied air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Iodoform must be stored to avoid contact with lithium and steam, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from mercuric oxide, calomel, silver nitrate; tannin, balsam, and acetone.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include iodine. Extinguish fire using an agent suitable for type of surrounding fire. This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Iodoform, Trenton, NJ (May 2003).

Iprodione I:0185

Formula: $C_{13}H_{13}Cl_2N_3O_3$

Synonyms: Anfor; Chipco 26019; 3-(3,5-Dichlorophenyl)-*N*-(1-methylethyl)-2,4-dioxo-1-imidazolidinecarboxamide; 3-(3,5-Dichlorophenyl)-*N*-isopropyl-2,4-dioxo-1-imidazolidinecarboximide; Diva; DOP 26019; Glycophen; Glycophene; Iprodine; 1-Isopropyl carbamoyl-3-(3,5-dichlorophenyl)-hydantoin; Kiden; LFA 2043; MRC 910; Promidione; Proturf; Rop 500f; Rovral; RP-26019; Verisan

CAS Number: 36734-19-7

HSDB Number: 6855

RTECS Number: NI8870000
UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171
EC Number: 253-178-9 [*Annex I Index No.*: 616-054-00-9]
Regulatory Authority and Advisory Information
Carcinogenicity[83]: EPA, Likely to be carcinogenic to humans; EU GHS Category 2: Suspected human carcinogen.
California Proposition 65 Chemical[102]: Carcinogen (5/1/1996)
Hazard Alert: Possible endocrine disruptor.
Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]
Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R40; R50/53; safety phrases: S2; S36/37; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]
Description: White crystalline solid. Odorless. Molecular weight = 330.18; specific gravity (H_2O:1) = 1.0; freezing/melting point = 135−136°C. Vapor pressure = 1.2×10^{-7} mmHg; flash point = 150°C. Low solubility in water; solubility = 15 mg/L.
Potential Exposure: Iprodione is a dicarboximide contact and/or locally systemic fungicide used to control a broad range of root and stem rots, molds and mildews on a variety of field, fruit, and vegetable crops including almonds, grapes, peaches, potatoes, rice, berries, onions, peanuts and lettuce. Registration does not permit uses on turf, ornamentals and vegetable and small fruit gardens. End-uses for the formulations have been classified for outdoor use only the application methods have been restricted so to avoid undue human contact. Iprodione can also be used as a postharvest fungicide and seed treatment.
Incompatibilities: Slowly hydrolyzes in water, releasing ammonia and forming acetate salts. Incompatible with oxidizers, chlorates nitrates, peroxides; and alkaline materials. Imides react with azo and diazo compounds to generate toxic gases. Flammable gases are formed by the reaction of organic imides with strong reducing agents such as hydrideds and active metals. Imides are extremely weak bases (weaker than water). React with strong bases to form salts. That is, they can react as acids.
PELs in Air: No standards set.
Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].
Permissible Concentration in Water: State Drinking Water Guidelines: Florida 280 μg/L. Runoff from spills or fire control may cause water pollution.
Determination in Water: Octanol−water coefficient: Log $K_{\mathrm{ow}} = > 3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Low—378.15513 ppb, MATC.
Harmful Effects and Symptoms
Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air purifying respirators for pesticides. May be harmful if swallowed. LD_{50} (oral, rat) $= > 3$ g/kg; LD_{50} (dermal, rat) $= > 2.5$ g/kg.
Long-Term Exposure: May cause lung, pulmonary problems. May cause cancer. Human toxicity (long term)[101]: High—7.97268 ppb, CHCL (Chronic Human Carcinogen Level).
Points of Attack: Lungs. Endocrine disruptor.
Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. DuPont Tychem suit fabrics[88] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this

chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, heat and incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. If this material contains a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquid containing this chemical in vermiculite, dry sand; earth, or similar material. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Captan may burn, but does not ignite readily. May be combustible at temperatures above 150°C. Thermal decomposition products may include toxic oxides of nitrogen, carbon and hydrogen chloride gas. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam*. *On a large fire*: use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods.

HSDB Number: 604

RTECS Number: NO4565500

UN/NA & ERG Number: UN3089 (Metal powder, flammable, n.o.s.)/170; UN3178/131

EC Number: 231-096-4

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable solid, Pyrophoric hazard, Strong reducing agent, Water reactive

United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron

European/International Regulations (powder): Hazard Symbol: F, Xn; risk phrases: R10; R17; R36/38; safety phrases: S16; S26; S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Iron is a malleable, silver-gray metal or a gray powder. Molecular weight = 55.85; specific gravity (H_2O:1) = 7.9 @ 20°C; boiling point = 2861°C; freezing/melting point = 1538°C. Ignition temperature of dust cloud = 420°C; Minimum Explosive concentration = 0.10 oz/ft^3[209]. Hazard identification (based on NFPA-704 M Rating System): (*powder*) Health 1, flammability 3, reactivity 1. Insoluble in water. Relative explosion hazard of dust: Strong.

Potential Exposure: Iron is alloyed with carbon to produce steel. The addition of other elements e.g., manganese, silicon, chromium, vanadium, tungsten, molybdenum, titanium, niobium, phosphorus, zirconium, aluminum, copper, cobalt, and nickel) imparts special characteristics to the steel. Occupational exposures occur during mining, transporting, and preparing of ores; and during the production and refining of the metal and alloys. In addition, certain workers may be exposed while using certain iron-containing materials-welders, grinders, polishers, silver finishers; metal workers and boiler scalers.

Incompatibilities: Dust forms an explosive mixture with air. Ultrafine iron powder is pyrophoric and may be potentially explosive. Violent reaction with strong oxidizers, acetaldehyde, (HEAT plus any of the following: ammonium nitrate; bromine pentafluoride; nitryl fluoride; sodium peroxide). Violent reaction with ammonium peroxodisulfate; chloric acid; chlorine trifluoride; chloroform amidinium nitrate; chlorine, dinitrogen tetraoxide; hydrogen peroxide; liquid fluorine; peroxyformic acid; potassium perchlorate; potassium dichromate; sodium acetylide.

PELs in Air

NIOSH IDLH = 2500 mg[Fe]/m^3

OSHA PEL: 10 mg[Fe]/m^3 TWA (dust and fume)

ACGIH TLV[1]: 5 mg[Fe]/m^3 (vapor, dust) TWA; not classifiable as a human carcinogen

PAC Ver. 29[138]

PAC-1: 3.2 milligram per cubic meter

PAC-2: 35 milligram per cubic meter

PAC-3: 150 milligram per cubic meter

DFG MAK: 1.5 mg[Fe]/m^3 respirable fraction

Arab Republic of Egypt: TWA 3 ppm (5 milligram per cubic meter) (fume), 1993; Australia: TWA 5 milligram per cubic meter (fume), 1993; Austria: MAK 6 milligram per cubic meter (*dust*), 1999; Denmark: TWA 3.5 mg[Fe]/m^3, 1999; Finland: TWA 5 ppm (fume), 1999; France: VME 5 milligram per cubic meter (fume), 1999; the Netherlands: MAC-TGG 5 mg[Fe]/m^3, 2003; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Norway: TWA 3 milligram per cubic meter, 1999; the Philippines: TWA 10 milligram per cubic meter (fume), 1993; Poland: MAC (TWA) (fume) 5 milligram per cubic meter, MAC (STEL) 10 milligram per cubic meter, 1999; Sweden: NGV 3.5 milligram per cubic meter (fume), 1999; Switzerland: MAK-W 6 milligram per cubic meter) (fume), 1999; Thailand: TWA 10 milligram per cubic meter (fume), 1993; Turkey: TWA 10 milligram per cubic meter (fume), 1993; United Kingdom: TWA 5 mg [Fe]/m^3; STEL 10 mg[Fe]/m^3, 2000; United Kingdom: TWA 10 milligram per cubic meter, rouge, total inhalable dust, 2000; United Kingdom: TWA 4 milligram per cubic meter, rouge, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

As iron, soluble salts [as Fe]

NIOSH REL: 1 [Fe]milligram per cubic meter TWA

ACGIH TLV[1]: 1 [Fe]milligram per cubic meter TWA

Determination in Air: Use NIOSH Analytical Method (IV) #7300, Elements.

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L.

Routes of Entry: Inhalation, ingestion, eyes.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Iron dust and fresh iron oxide fumes may cause respiratory irritation and metal fume fever, characterized by metallic taste; dry irritated throat; coughing, shortness of breath; weakness, fatigue, fever, chills, sweating and pain in the muscles and joints. *Skin*: Hot metal may cause burns and irritation. *Eyes*: Dust may cause irritation and inflammation. *Ingestion*: May cause drowsiness, sluggishness, paleness, increased heart and respiration rates, shock; bloody vomiting, and diarrhea.

Long-Term Exposure: Excessive intake of iron compounds may result in increased accumulation of iron in body, especially the liver, spleen and lymphatic system. Inhalation of dusts may cause mottling of the lung. Benign pneumoconiosis with X-ray shadows indistinguishable from fibrotic pneumoconiosis (siderosis). There is limited evidence of an increase in lung cancer among iron ore miners. Iron oxide's role in this increase is unclear at this time. Prolonged or repeated contact can discolor the eyes, causing permanent iron staining.

Points of Attack: Respiratory system, skin.

Medical Surveillance: NIOSH lists the following tests (iron oxide fume): chest X-ray; pulmonary function tests: FVC, forced expiratory volume (1 second); urine (chemical/ metabolite). Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give eggs or milk. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours. *Note to Physician*: Gastric lavage is only beneficial if done within one hour of ingestion. Deferoxamine may be beneficial in reducing systemic levels. Serum iron levels may be useful in determining severity of exposure if measured during acute phase of intoxication. In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics.

Note to physician: For severe poisoning *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing (leather gauntlets, welding masks, steel-toed shoes as needed) to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: To prevent exposure to dusts, wear a dust mask.

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials (see above). Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN3178 Flammable solids, inorganic, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Fine iron powder is pyrophoric and potentially explosive. Thermal decomposition products may include metal oxides of iron. Thermal decomposition products may include metal oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water*. For large fires use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfilling. Remove metal with an electromagnet and salvage.

Iron-Dextran Complex I:0200

Formula: $[C_6H_{10}O_3]_n[Fe(OH)_3]_n$

Synonyms: B 75; Chinofer; Dextran ion complex; Dextrofer 75; Eisendextran (German); Fe-Dextran; Fenate; Ferdex 100; Ferric dextran; Ferridextran; Ferrodextran; Ferroflukin 75; Ferroglucin; Ferroglukin 75; Imferon; Imposil; Iro-Jex; Iron dextran; Iron dextran injection; Iron hydrogenated dextran; Ironorm injection; Myofer 100; Polyfer; Prolongal; Ursoferran

CAS Registry Number: 9004-66-4; 9061-47-6 (powder)

HSDB Number: 5102

RTECS Number: NI2200000

UN/NA & ERG Number: UN1851 (medicine, liquid, toxic, n.o.s.)/151

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987

California Proposition 65 Chemical[102]: Cancer 1/1/1988

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R45; R36/37/38; R34; R40; R50; R62; safety phrases: S3; S22; S26; S36/37/39; S45; S53 (see Appendix 4)

Description: Iron-dextran complex is a sterile, dark-brown colloidal solvent. Iron-dextran is a complex of ferric hydroxide with dextran. Dextrans are polysaccharides produced by bacterial action on sucrose. Compounds in this group are pharmaceuticals containing some form of iron associated with carbohydrates of varying complexity. Soluble in water.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Iron dextran is unstable at a pH of 5 and decomposes at 149–158°F. It may be sensitive to prolonged exposure to air[101]. Avoid excessive heat; store between 15 and 20°C.

Potential Exposure: Iron-dextran complex is a parenteral form of medication used in iron-deficiency anemia in humans and baby pigs. The product for human use is a sterile, dark-brown colloidal solution in saline. The products designed for animal use are more concentrated.

PELs in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Harmful Effects and Symptoms

Long-Term Exposure: Iron dextran is carcinogenic in mice and rats after subcutaneous or intramuscular injection, producing local tumors. There have been case reports of sarcomas associated with injections of iron dextran. The tumors appeared at the probable site of the injections, and the similarity of the local effect in humans and animals was noted. Intramuscular injections of iron dextran can cause severe anaphylactic reactions.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to physician*: For severe poisoning *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Avoid excessive heat; store between 15 and 20°C prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Large quantity: UN1851 Medicine, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of carbon and metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Iron Oxide I:0210

Formula: Fe_2O_3

Synonyms: Anchred standard; Anhydrous iron oxide; Armenian bole; Bauxite residue; Black oxide of iron; Blended red oxides of iron; Burnt island red; Burnt sienna; Burnt umber; Calcotone red; Caput mortuum; C.I.77491; C.I. Pigment red 101 Mortuum; Colloidal ferric oxide; Deanox; English red; Ferric oxide; Ferrugo; Indian red; Iron(III) oxide; Iron oxide red; Iron sesquioxide; Jeweler's rouge; Levanox red 130A; Light red; Manufactured iron oxides; Mars brown; Mars red; Natural iron oxides; Natural red oxide; Ochre; Prussian brown; Raddle; Red iron oxide; Rouge; Rubigo; Sienna; Specular iron; Stone red; Supra; Synthetic iron oxide; Venetian red; Vitrol red; Vogel's iron red; Yellow ferric oxide; Yellow oxide of iron

CAS Registry Number: 1345-25-1; 1309-37-1 (*ferric oxide; diiron trioxide*); *(alt.)* 8011-97-0; 1317-61-9 [*iron(II,III) oxide; ferrosoferric oxide*]; 1317-60-8 (*hematite*)

HSDB Number: 464

RTECS Number: NO7400000 (III); NO7525000 (fume)

UN/NA & ERG Number: UN1376 (spent); UN3178 (flammable solid, inorganic, n.o.s.)/133; UN3089/170

EC Number: 215-721-8 (iron oxide); 215-168-2 (diiron trioxide); 215-275-4 (hematite)

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Inadequate Evidence; No Human Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987 (III, dust)

Hazard Alert (spent): Highly flammable, Pyrophoric.

United States National Primary Drinking Water Regulations: SMCL = 0.3 mg[Fe]/L as Iron

European/International Regulations (spent, pyrophoric): Hazard Symbol: F; risk phrases: R11; R17; safety phrases: S7/9; S16; S21, S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Iron oxide is a reddish-brown powder; Iron(II) oxide is a black solid material. Molecular weight = 159.7 (III and fume); 73.85 (II); specific gravity (H_2O:1) = 5.26; 6.0 (II); freezing/melting point = 1539°C; 1377°C (II). Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 0. Insoluble in water.

Potential Exposure: Iron oxide fumes are produced when iron containing materials are heated very hot, as in arc welding, and is composed of particles too small to see. Used in metallurgy, paint pigments; coloring rubber; polishing compounds; gas purification; in electronic components: permanent magnets, computer memory cores; magnetic tapes. Used as a mordant, laboratory reagent; as a catalyst, feed additive.

Incompatibilities: Keep away from calcium hypochlorite. Contact with hydrogen peroxide, ethylene oxide; and calcium hypochlorite will cause explosions. Reacts violently with powdered aluminum; hydrazine, and hydrogen trisulfide.

PELs in Air

NIOSH IDLH = 2500 mg[Fe]/m^3

Fe_2O_3

OSHA PEL: 10 mg[Fe]/m^3 TWA (fume); Rouge: TWA; 15 mg[Fe]/m^3, total dust: 5 mg[Fe]/m^3, respirable fraction

ACGIH TLV[1]: 5 mg[Fe]/m^3 respirable fraction TWA; Rouge: same as Fe_2O_2; not classifiable as a human carcinogen

Nuisance particulates; (fume) 10 mg[Fe]/m^3 TWA

PAC Ver. 29[138]

PAC-2: 500 milligram per cubic meter

PAC-3: 3000 milligram per cubic meter

Determination in Air: Filter; Acid; Inductively coupled plasma (ICP); NIOSH Analytical Method (IV) #7300, Elements. See also OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Federal Drinking Water Guidelines: MCGL = 300 μg[Fe]/L; State Drinking Water Standards: Illinois: 1000 μg[Fe]/L; North Carolina: 300 μg[Fe]/L.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Iron oxide fume can affect you when breathed in. Exposure can cause metal fume fever. This is a flu-like illness with symptoms of metallic taste; fever and chills; aches, chest tightness and cough.

Long-Term Exposure: Prolonged or repeated contact can cause permanent iron staining of the eyes. Repeated exposure to iron oxide fume can cause changes on the chest X-ray. Benign pneumoconiosis with X-ray shadows indistinguishable from fibrotic pneumoconiosis (siderosis).

Points of Attack: Respiratory system.

Medical Surveillance: NIOSH lists the following tests (iron oxide fume): chest X-ray; pulmonary function tests: FVC, forced expiratory volume (1 second); urine (chemical/metabolite). Sometimes, iron-containing metals also contain metals which scar or damage the lungs, such as cobalt, nickel, cadmium, or chromium. See also NIOSH #8310, Metals in Urine; NIOSH Profile (Welding and Brazing).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4–12 hours following exposure: it may last less than 36 hours.

Note to physician: For severe poisoning *do not* use BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *2,500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (*iron powder and chips*): Color code—Red Stripe: Flammability Hazard (4.2): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Iron oxide fume must be stored to avoid contact with calcium hypochlorite, aluminum, ethylene oxide and hydrazine, since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3176 Iron oxide, spent, or iron sponge, spent or obtained from coal gas purification, Hazard Class: 4.2; Labels: 4.2-Spontaneously combustible material. UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN3178 Flammable solid, inorganic, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include metal oxides. Use special mixtures of dry chemicals appropriate for extinguishing metal fires. *Do not use water*. For large fires use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Iron pentacarbonyl is a highly flammable colorless to yellow to dark-red viscous liquid. Molecular weight = 195.9; specific gravity (H_2O:1) = 1.45 @ 25°C; boiling point = 102.8°C @ 749 mmHg; freezing/melting point = −25°C; freezing/melting point = −21°C; vapor pressure = 40 mmHg @ 30°C; flash point = −15°C (cc) ; autoignition temperature = 50°C; Explosive limits: LEL = 3.7%; UEL: 12.5%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 1. Insoluble in water.

Potential Exposure: Iron carbonyl is used as a catalyst in organic reactions; to make carbonyl iron, which is used in high frequency coils for the radio and television industry; and as an antiknock agent in motor fuels; to make finely divided iron.

Incompatibilities: Vapor may form explosive mixture with air. Chemically unstable. May explode on heating. Pyrophoric; ignites spontaneously on contact with air. Iron pentacarbonyl is decomposed by heat, light, producing toxic gases, including iron oxides and carbon monoxide. The substance is a strong reducing agent and reacts violently with oxidizers, nitrogen oxide; acetic acid; strong bases; water, amines, halogens, hydrogen, carbon tetrachloride, phosgene, mercaptans, transition metal halides, (zinc + cobalt halides). Organometallics are reactive with many other groups. Incompatible with acids and bases. Organometallics are good reducing agents and therefore incompatible with oxidizing agents. Often reactive with water to generate toxic or flammable gases. A brown pyrophoric powder is produced by the combination of the carbonyl with acetic acid containing greater than 5% of water[101]. Store under nitrogen.

PELs in Air

OSHA PEL: None

NIOSH REL: 0.1 ppm[Fe]/0.23 milligram per cubic meter TWA; 0.2 ppm/0.45 milligram per cubic meter [Fe] STEL

ACGIH TLV[1]: 0.1 ppm/0.23 milligram per cubic meter TWA; 0.2 ppm/0.45 milligram per cubic meter STEL

PAC* Ver. 29[138]

PAC-1: 0.0055 ppm

PAC-2: $\mathbf{0.06_A}$ ppm

PAC-3: $\mathbf{0.18_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

DFG MAK: 0.1 ppm/0.81 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D

Australia: TWA 0.1 ppm (0.8 milligram per cubic meter); STEL 0.2 ppm, 1993; Austria: MAK 0.1 ppm (0.8 milligram per cubic meter), 1999; Belgium: TWA 0.1 ppm (0.23 milligram per cubic meter); STEL 0.2 ppm, 1993; Denmark: TWA 0.1 ppm (0.8 milligram per cubic meter), 1999; Finland: STEL 0.01 ppm (0.08 milligram per cubic meter), 1999; France: VME 0.1 ppm (0.8 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.08 milligram per cubic meter, 2003; Russia: STEL 0.1 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 0.1 ppm (0.8 milligram per cubic meter), KZG-W 0.2 ppm, 1999; United Kingdom: TWA 0.01 ppm (0.08 mg[Fe]/m^3 [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 0.2 [Fe]ppm. Several states have set guidelines or standards for iron pentacarbonyl in ambient air[60] ranging from 8−16 μ/m^3 (North Dakota) to 13 μ/m^3 (Virginia) to 16 μ/m^3 (Connecticut) to 19 μ/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Iron pentacarbonyl can irritate the respiratory tract causing cough and/or shortness of breath. Inhalation may result in dizziness, nausea, and vomiting; if exposure continues, unconsciousness will follow. Twelve-to-twenty-four hours later, fever, cough, and shortness of breath may follow. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Contact can cause irritation of the skin. Toxicity of this compound is high via all routes of entry. Cyanosis (bluish discoloration of skin) and circulatory collapse may occur after exposure. Death may result. Pneumonitis and injury to the kidneys, liver, and central nervous system may also occur.

Long-Term Exposure: Iron pentacarbonyl can cause lung irritation and bronchitis may develop. Repeated exposures can damage the liver, lungs, and brain.

Points of Attack: Eyes, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Consider chest X-ray after acute overexposure. Exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature.

Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 0.1 ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where iron pentacarbonyl may be present, check to make sure that an explosive concentration does not exist. Store under nitrogen. Iron pentacarbonyl must be stored to avoid contact with water, since violent reactions occur. Store away from contact with light and air, oxidizers, and other incompatible materials listed above. Iron pentacarbonyl should be handled in an automatic mechanized fashion at all times. Containers should be flushed with nitrogen before opening. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1994 Iron pentacarbonyl, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Inhalation Hazard Zone A.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (*From a small package or a small leak from a large package*)

First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.6/0.9
Night 1.3/2.0

Large spills (*From a large package or from many small packages*)

First: Isolate in all directions (ft/m) 1250/400
Then: Protect persons downwind (mi/km)
Day 3.0/4.8
Night 5.2/8.9

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Do not breathe vapors. Shut off or remove ignition sources in hazard area. Do not touch spilled material. Stop leak if this can be done without risk. Use water spray to reduces vapors. Take up *small spills* with sand or other noncombustible absorbent material and place into containers for later disposal. Dike far ahead of *large spills* for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Pyrophoric; this chemical is a flammable liquid and can ignite in air. Thermal decomposition includes oxides of metal and carbon. This material is incompatible with water. Use dry chemical, carbon dioxide; water spray; or foam for small fires. Specially trained personnel operating from a safe distance can fight large fires using dry chemical or foam. Move material from fire area if this can be done without risk. Dike fire control water for later disposal. Isolate hazard area and deny entry. Stay upwind and keep out of low areas. Isolate area in all directions if tank car or truck is involved in fire. See isolation distances above. Wear positive pressure breathing apparatus and special protective clothing. Cool containers exposed to flames with water until fire is out. This material presents a vapor explosion and poison hazard indoors, outdoors, or in sewers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isoamyl acetate is a clear, colorless liquid with a banana-like odor. Molecular weight = 130.21; specific gravity (H_2O:1) = 0.876 @ 15°C; boiling point = 142.5°C; freezing/melting point = −78.5°C; vapor pressure = 4 mmHg @ 20°C; 5.6 mmHg @ 25°C; flash point = 25°C; autoignition temperature = 360°C; 379C[136]. Flammability limits: LEL = 1.0% @ 100°C; UEL: 7.5%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0₩. Floats on water; poor, slight to negligible, solubility. Reacts with water forming flammable, irritating vapor.

Potential Exposure: Used as a solvent in making lacquers, paints, perfumes, artificial fruit flavorings; smokeless powder; airplane "dopes;" dry cleaning compounds.

Incompatibilities: May form explosive mixture with air. Strong alkalis, strong acids; nitrates, oxidizers. Violent reaction with reducing agents. Attacks asbestos; softens and dissolves many plastics, rubber, and coatings.

PELs in Air

NIOSH IDLH = 1000 ppm

Odor threshold = 0.015−0.22 ppm. *Note*: The range of accepted odor threshold values is quite broad and caution should be used in relying on odor alone as a warning of potentially hazardous exposure.

OSHA PEL: 100 ppm/525 milligram per cubic meter TWA

NIOSH REL: 100 ppm/525 milligram per cubic meter TWA

Determination in Air: Use NIOSH Analytical Method (IV) #1450, Esters I; OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure to high concentrations of vapors can cause headache. drowsiness, dizziness, lightheadedness, fatigue, and unconsciousness.

Long-Term Exposure: Prolonged contact can cause skin drying and cracking. Can irritate the lungs with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system; central nervous system.***Medical Surveillance***. Lung function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Move to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1000 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:PD,PP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN1104 Amyl acetates, Hazard Class: 3; Labels: 3-Flammable liquid

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

123-51-3, primary-
PAC-1: 125 ppm
PAC-2: 1700 ppm
PAC-3: 10,000 ppm
DFG MAK (primary): 20 ppm/73 milligram per cubic meter TWA; Peak Limitation Category II(4); Pregnancy Risk Group C
Australia: TWA 100 ppm (360 milligram per cubic meter); STEL 125 ppm, 1993; Austria: MAK 100 ppm (360 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (361 milligram per cubic meter); STEL 125 ppm (452 milligram per cubic meter), 1993; Denmark: TWA 100 ppm (360 milligram per cubic meter), 1999; France: VME 100 ppm (360 milligram per cubic meter), 1999; Japan: 100 ppm (360 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 360 milligram per cubic meter, 2003; the Philippines: TWA 100 ppm (360 milligram per cubic meter), 1993; Russia: TWA 100 ppm; STEL 5 milligram per cubic meter, 1993; Switzerland: MAK-W 100 ppm (360 milligram per cubic meter), KZG-W 200 ppm (720 milligram per cubic meter), 1999; Turkey: TWA 100 ppm (360 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (366 milligram per cubic meter); STEL 125 ppm (458 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 125 ppm. Several states have set guidelines or standards for isoamyl alcohol in ambient air[60] ranging from 3.6−4.5 milligram per cubic meter (North Dakota) to 7.2 milligram per cubic meter (Connecticut, Florida and New York) to 8.571 milligram per cubic meter (Nevada).
(*secondary-*)
Denmark: TWA 100 ppm (360 milligram per cubic meter), 1999; Norway: TWA 50 ppm (180 milligram per cubic meter), 1999; Poland: MAC (TWA) 100 milligram per cubic meter, MAC (STEL) 450 milligram per cubic meter, 1993
Determination in Air: Use NIOSH Analytical Method (IV)s (*primary-and secondary-*) #1402, for Alcohols III; (*primary-*) #1405 for Alcohols Combined.
Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient level goal for all primary pentanols of 5000 μg/L, based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.42$ (*primary-*). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. If ingested, may affect the central nervous system. Isoamyl alcohol can affect you when breathed in and by passing through your skin. Contact can cause severe burns of the eyes, leading to permanent damage. It can irritate the nose and throat. Higher levels may irritate the lungs, causing coughing and/or shortness of breath. Higher exposure can cause dizziness, lightheadedness, headache, cough, dyspnea (breathing difficulty), nausea, vomiting, diarrhea, narcosis, unconsciousness, and death.

Long-Term Exposure: Repeated or prolonged exposure to isoamyl alcohol can cause drying and cracking of the skin. May cause tumors. May cause liver damage. Isoamyl alcohol can irritate the lungs and may cause bronchitis.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests, liver function tests.

First Aid: If isoamyl alcohol gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours**: butyl rubber gloves, suits, boots; Neoprene rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; Viton gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where Isoamyl alcohol may be present, check to make sure that an explosive concentration does not exist. Isoamyl alcohol must be stored to avoid contact with strong oxidizers, such as chlorine, and bromine, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where isoamyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1105 Pentanols or Amyl alcohols, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is flammable. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Isobenzan I:0250

Formula: $C_9H_4Cl_8O$

Synonyms: CP14,957; ENT 25,545; ENT25,545-X; Isobenzano (Spanish); 1,3,4,5,6,7,10,10-Octochloro-4,7endo-methylene-4,7,8,9-tetrahydrophthalan; 1,3,4,5,6,8,8-Octochloro-1,3,3a, 4,7,7a-hexahydro-4,7-methanoisobenzofuran; Octochlorohexahydromethanoisobenzofuran; 1,3,4,5, 6,7,8,8-Octochloro-2-*oxa*-3a,4,7,7a-tetrahydro-4,7-methanoindene; Omtan; R 6700; SD 440; Shell 4402; Shell WL 1650; Telodrin; WL 1650

CAS Registry Number: 297-78-9

HSDB Number: 6388

RTECS Number: PC1225000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN2761/151

EC Number: 206-045-4 [*Annex I Index No.*: 602-053-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Exposure can be lethal, Possible risk of forming tumors, Environmental hazard, Agricultural chemical.

Banned or Severely Restricted (several countries) (UN)[13]

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (454/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg).

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R27/28; R50/53; safety phrases: S1/2; S28; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water

Description: Isobenzan is a white to light brown crystalline powder. Molecular weight = 411.73; specific gravity (H_2O:1) = 1.87 @ 20°C; freezing/melting point = 121.3°C; vapor pressure = 1×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: Isobenzan is a potential danger to those involved in the manufacture, formulation or application of this insecticide.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Decomposes in temperatures >200°C releasing corrosive and toxic hydrogen chloride and chlorine.

PELs in Air

PAC Ver. 29[138]

PAC-1: 0.01 milligram per cubic meter

PAC-2: 0.11 milligram per cubic meter

PAC-3: 0.66 milligram per cubic meter

Routes of Entry: Ingestion, skin contact, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: This material is highly toxic. It is absorbed by the skin as well as by the respiratory and gastrointestinal tracts. Symptoms may last for a long time because the material is eliminated slowly; its half-life in human blood is 2.77 years[88,136]. Symptoms of exposure include headache, dizziness, drowsiness, irritability, and numbness of the legs. Convulsions may occur.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Use positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and fully-encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA (SCBA) with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft[70]. Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Keep upwind. Avoid bodily contact with the material. Keep unnecessary people away; isolate hazard area and deny entry. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride, chlorine and oxides of carbon. Use agent suitable for type of surrounding fire. Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide; or dry chemical. Avoid breathing dusts and fumes from burning material. Keep upwind. Avoid bodily contact with the material. Wear full protective clothing including boots, protective gloves, goggles; and wear SCBA. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: 200-857-2 [*Annex I Index No.*: 601-004-00-0]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Hazard Alert: Poison, Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R5; R12; R21; safety phrases: S1; S2; S9; S16; S33; S38; S45

Description: Isobutane is a colorless gas. It has a gasoline or natural gas odor. Shipped as a liquefied compressed gas. Molecular weight = 58.12; specific gravity (H_2O:1) = 0.56 (liquid); boiling point = −12°C; freezing/melting point = 159.4°C; relative vapor density (air = 1) = 2.06; vapor pressure = 750 mmHg @ −12°C; flash point = −60°C; autoignition temperature = 460°C. Explosive limits: LEL = 1.8%; 10,600 ppm[138]; UEL: 8.4%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 0. Practically insoluble in water.

Potential Exposure: It is used as a refrigerant, fuel and aerosol propellant.

Incompatibilities: Forms explosive gas mixture with air. Strong oxidizers e.g., nitrates, perchlorates, chlorine, fluorine), (nickel carbonyl + oxygen) may cause fire and explosions. Reacts with acetylene, halogens, and nitrous oxides. May accumulate static electrical charges, and may cause ignition of its vapors.

PELs in Air

Conversion factor: 1 ppm = 2.38 milligram per cubic meter @ 25°C & 1 atm

Large amounts of isobutane will decrease the amount of available oxygen. Before entering a confined space, oxygen content should be tested to ensure that it is at least 19% by volume.

OSHA PEL: None

NIOSH REL: 800 ppm/1900 milligram per cubic meter TWA

ACGIH TLV[1]: 800 ppm TWA

PAC Ver. 29[138]

PAC-1: 5500 ppm

PAC-2: 17,000 ppm

PAC-3: 53,000 ppm

DFG MAK: 1000 ppm (2400 milligram per cubic meter) (isobutane and butane isomers).

Austria: MAK 800 ppm (1900 milligram per cubic meter), 1999; Switzerland: MAK-W 800 ppm (1900 milligram per cubic meter), 1999; United Kingdom: LTEL 600 ppm (1430 milligram per cubic meter); STEL 750 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 800 ppm

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.8. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Isobutane can affect you when breathed in. Isobutane vapor may irritate and burn the eyes. Contact with the liquid can cause frostbite. Exposure to very high amounts can cause dizziness, lightheadedness, irregular heartbeat; and unconsciousness. With extremely high levels, death can occur from lack of oxygen.

Long-Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking.

Points of Attack: Central nervous system; skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Prevent possible skin freezing from direct liquid contact. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to isobutane is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where isobutane may be present, check to make sure that an explosive concentration does not exist. Isobutane cylinders should be stored in a cool, well-ventilated dry area of noncombustible construction. Protect containers against physical damage. Store away from sources of heat or ignition and from oxygen, chlorine, and other oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where isobutane is handled, used, or stored. Ground and bond all lines and equipment used with isobutane. Wherever isobutane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1969 Isobutane, Hazard Class: 2.1; Labels: 2.1-Flammable gas; UN1075 Petroleum gases, liquefied or Liquefied petroleum gas, Hazard Class: 2.1; Labels: 2.1-Flammable gas. UN1075 also can be used for Isobutane mixture. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep isobutane out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Isobutane is a flammable gas or liquid. Stop the flow of gas if it can be done safely. Use dry chemical or CO_2 extinguishers. Use water to keep fire-exposed containers cool. Thermal decomposition includes oxides of carbon. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Isobutyl Acrylate I:0270

Formula: $C_7H_{12}O_2$: $CH_2{=}CHCOOCH_2CH(CH_3)_2$

Synonyms: Acrylic acid isobutyl ester; Isobutyl 2-propenoate; Isobutyl acrylate; Isobutyl propenoate; 2-Methylpropyl acrylate; 2-Propenoic acid 2-methylpropyl ester

CAS Registry Number: 106-63-8

HSDB Number: 610 as isobutyl acrylate

RTECS Number: AT2100000

UN/NA & ERG Number: UN2527/129 (P)

EC Number: 203-417-8 [*Annex I Index No.*: 607-115-00-0]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Polymerization hazard (nonstabilized), Sensitization hazard (skin), Suspected of causing genetic defects, Drug.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi, Xn; risk phrases: R11; R19; R20/21; R38; R43; safety phrases: S2; S9; S21; S24; S37; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isobutyl acrylate is a clear, colorless liquid. Molecular weight = 128.19; boiling point = 138°C (61−63°C @ 15 mm); flash point = 30°C; autoignition temperature = 427°C. Explosive limits: LEL = 1.9%; UEL: 8.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 2. Slightly soluble in water.

Potential Exposure: This material is used as a monomer for making acrylate resins.

Incompatibilities: Vapor may form explosive mixture with air. Heat and contamination may cause polymerization. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, aliphatic amines, alkanolamines.

PELs in Air

No standards or PAC available for isobutyl acrylate. See *n*-butyl acrylate 141-32-2; record # B:0830.

Harmful Effects and Symptoms

Short-Term Exposure: Irritating to skin, eyes, nose, and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Moderately toxic when swallowed. LD_{50} (oral-rat) = 7070 mg/kg. Contact with the eyes causes minor irritation no worse than that produced by hand soap.

Long-Term Exposure: Can irritate the lungs. May cause bronchitis to develop.

Points of Attack: Lungs, skin.

Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure. Evaluation by a dermatologist and/or qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2527 Isobutyl acrylate, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorbent may be used to consolidate spills on land (such as sorbent polyurethane foams). Oil-skimming equipment may be used for spills on water. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray into incinerator. Flammable solvent may be added.

Isobutylene I:0280

Formula: C_4H_8

Synonyms: γ-Butylene; 1,1-Dimethylethylene; Isobutene; Isobutylene; Liquefied petroleum gas; 2-Methylpropylene; 2-Metilpropeno (Spanish); 1-Propene, 2-methyl-

CAS Registry Number: 115-11-7

HSDB Number: 613

RTECS Number: UD0890000

UN/NA & ERG Number: UN1055 (Isobutylene)/115 (P); UN1075 (Liquefied petroleum gas)/115

EC Number: 204-066-3 [*Annex I Index No.*: 601-012-00-4]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); equivocal evidence: rat; no evidence: mouse.

Hazard Alert: Poison, Extremely flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Polymerization hazard.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): D001.

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R5; R12; R19; R21; safety phrases: S1; S2; S9; S19; S16; S33; S38 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Non hazard to water.

Description: Isobutylene, an aliphatic hydrocarbon, is a colorless gas, or liquid under pressure. Sweet, gasoline odor. Molecular weight = 56.12; specific gravity (H_2O:1) = 0.588; boiling point = −7°C. Freezing point = −140°C; relative vapor density (air = 1) = 1.94; vapor pressure = 3278 mmHg @ 37.7°C; flash point = −76°C (cc); autoignition temperature = 465°C. Explosive Limits: LEL = 1.8%; UEL: 9.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 1. Practically insoluble in water.

Potential Exposure: Used in the production of aviation gasoline, butyl rubbers; resins, other intermediates and chemicals; making antioxidants for food, packaging, and plastics.

Incompatibilities: Flammable gas; forms explosive mixture with air. Polymerizes easily. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, hydrogen bromide, nitrogen oxides and numerous other materials. May accumulate static electrical charges, and may cause ignition of its vapors.

PELs in Air

PAC Ver. 29[138]

PAC-1: 750 ppm

PAC-2: 2500 ppm

PAC-3: 11,000 ppm

Russia: STEL 100 milligram per cubic meter, 1993

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.4. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and respiratory tract. Contact with the liquid can cause frostbite. Can cause headache, dizziness, lightheadedness, and fatigue. Higher levels can cause coma and death.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; *do not* rub the affected areas or flush them with water.

In order to prevent further tissue damage, *do not* attempt to remove frozen clothing from frostbitten areas. If frostbite has *not* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact resistant goggles when working with gas. Wear splash-proof chemical goggles and face shield when working with liquids unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8—10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with Isobutylene all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Where possible, automatically pump isobutylene from cylinders or from other storage containers to process containers. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1055 Isobutylene, Hazard Class: 2.1; Labels: 2.1-Flammable gas. UN1075 Petroleum gases, liquefied or Liquefied petroleum gas, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Nonrefillable cylinders should be disposed of in accordance with local, state and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Isobutyraldehyde I:0300

Formula: C_4H_8O; $(CH_3)_2CHCHO$

Synonyms: Isobutaldehyde; Isobutanal; Isobutiraldehido (Spanish); Isobutyl aldehyde; Isobutyral; Isobutyric aldehyde; Isobutyryl aldehyde; Isopropyl aldehyde; Isopropyl formaldehyde; 2-Methyl-1-propanal; 2-Methylpropanal; Methylpropanal; α-Methylpropionaldehyde; 2-Methylpropio naldehyde; NCI-C60968; Propanal, 2-methyl-; Valine aldehyde

CAS Registry Number: 78-84-2

HSDB Number: 614

RTECS Number: NQ4025000

UN/NA & ERG Number: UN2045/130 (P)

EC Number: 201-149-6

Regulatory Authority and Advisory Information

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); no evidence: mouse, rat.

Hazard Alert: Poison, Highly flammable liquid, Polymerization hazard (unstabilized); Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn, Xi; risk phrases: R11; R19; R22; R36/37/38; R62; safety phrases: S9; S16; S21; S26; S29; S33; S36/37/39 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isobutyraldehyde is a colorless liquid with a pungent odor. The odor threshold is 0.05 ppm. Molecular weight = 72.11; specific gravity (H_2O:1) = 0.79 @ 20°C; boiling point = 64 °C; freezing/melting point = −65°C; vapor pressure = 173 mmHg @ 25°C; flash point = −18°C; autoignition temperature = 196°C. Explosive limits: LEL = 1.6%; 13,000 ppm[138]; UEL: 10.6%[17]. Hazard Identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 1. Slightly soluble in water; solubility = 7% @ 20°C.

Potential Exposure: Isobutyraldehyde is used in the organic synthesis of pantothenic acid, valine, leucine and cellulose ester; in making gasoline additives, perfumes, flavors, and plasticizers.

Incompatibilities: Forms explosive gas mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, mineral acids, strong bases, caustics, reducing agents; aliphatic amines; alkanolamines, aromatic amines.; strong oxidizers. Can undergo exothermic self-condensation or polymerization reactions that are often catalyzed by acid. Generates flammable and/or toxic gases in combination with azo, diazo compounds, dithiocarbamates and nitrides,. Reacts slowly when exposed to air with air to give peroxides and other products. These reactions are activated by light, catalyzed by salts of transition metals, and are autocatalytic (catalyzed by their products). The addition of stabilizers (antioxidants) retards autoxidation[101].

PELs in Air

PAC Ver. 29[138]

PAC-1: 75 ppm

PAC-2: 78 ppm

PAC-3: 470 ppm

Poland: MAC (TWA) 100 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter [skin], 1993

Determination in Air: Use NIOSH Analytical Method #2539, aldehydes, screening.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.2. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Skin absorption, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Isobutyraldehyde can affect you when breathed in and by passing through your skin. Corrosive to the eyes, skin, and respiratory tract. High levels can irritate the lungs. High levels can cause you to feel dizzy, lightheaded and to pass out. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Corrosive on ingestion. Exposure may result in death.

Long-Term Exposure: Can irritate the lungs and may cause bronchitis to develop. Repeated exposure can cause skin dryness, itching and rash.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to isobutyraldehyde exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Stable for two weeks when stored under nitrogen at temperatures up to 77°F. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where isobutyraldehyde is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of isobutyraldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isobutyraldehyde. Wherever isobutyraldehyde is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2045 Isobutyraldehyde or Isobutyl aldehyde, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Corrosive, Primary irritant (w/o allergic reaction).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below), as isomer of butyric acid

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C, Xn; risk phrases: R10; R 21/22; R36/38; R41; safety phrases: S2; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isobutyric acid is a colorless liquid. Odor of rancid butter fat. Molecular weight = 88.12; specific gravity (H_2O:1) = 0.95 @ 20°C; boiling point = 152°C; freezing/melting point = −47°C; vapor pressure = 1 mmHg @ 14.7°C; flash point = 56°C (oc); autoignition temperature = 481.6°C. Flammability limits: LEL = 2.0%; 12,000 ppm[138]; UEL: 9.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Soluble in water.

Potential Exposure: Isobutyric acid is used to make solvents, flavors, perfumes, varnishes, disinfectants; and in tanning; in nonalcoholic beverages and processed foods.

Incompatibilities: May form explosive mixture with air. Aqueous solution forms a medium-strong acid. Incompatible with oxidizers, sulfuric acid; caustics, ammonia, amines, isocyanates, alkylene oxides; epichlorohydrin. Attacks aluminum and other metals.

PELs in Air

PAC Ver. 29[138]
PAC-1: 0.23 ppm
PAC-2: 2.6 ppm
PAC-3: 15 ppm

This chemical can be absorbed through the skin, thereby increasing exposure. For butyric acid the former-USSR-UNEP/IRPTC joint project MAC value is 2.5 ppm (10 milligram per cubic meter)[43] for work-place air. They also cite a momentary MAC value of 0.015 milligram per cubic meter and an allowable average daily MAC of 0.01 milligram per cubic meter in ambient air of residential areas.

Determination in Air: No method available.

Permissible Concentration in Water: Designated a hazardous substance and regulated under section 311 of the Federal Water Pollution Control Act and the Clean Water Act Amendments. See RQ above, for discharges of this substance.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Can cause severe eye and skin irritation and burns leading to permanent damage. Inhalation can cause respiratory tract irritation, coughing, wheezing and/or shortness of breath. Ingestion is poisonous and causes irritation of mouth and stomach; between 1 teaspoonful and 1 oz may be fatal. The LD_{50} is 280 mg/kg (oral, rat).

Long-Term Exposure: May affect the blood. Repeated exposures may cause bronchitis to develop with coughing, phlegm, and/or shortness of breath. May cause kidney damage.

Points of Attack: Kidneys, lungs, blood.

Medical Surveillance: Kidney function tests, CBC, lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water, or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, heat, food, and water. Where possible, automatically pump liquid from drums or other storage containers to process containers. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical.

Shipping: UN2529 Isobutyric acid, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Isobutyronitrile is a colorless liquid. Molecular weight = 69.11; specific gravity (H_2O:1) = 0.77 @ 20°C; boiling point = 104°C; freezing/melting point = −71.5°C; vapor pressure = 33 mmHg @ 25°C; flash point = 8°C; autoignition temperature = 482°C. Explosive limits: LEL = 1.6%; UEL: 10.6%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 0. Slightly soluble in water.

Potential Exposure: Isobutyronitrile, a nitrile, is used in organic synthesis; as an intermediate for insecticides; and as a gasoline additive.

Incompatibilities: Vapor may form explosive mixture with air. Reacts with oxidants, strong reductants and strong bases. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

PELs in Air

NIOSH REL: 8 ppm/22 milligram per cubic meter TWA; *Nitriles*: 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

PAC* Ver. 29[138]

PAC-1: 0.18 ppm

PAC-2: $\mathbf{2_A}$ ppm

PAC-3: $\mathbf{6.1_A}$ ppm

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**." AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Harmful Effects and Symptoms

Short-Term Exposure: The substance is corrosive to the eyes, skin, and respiratory tract. Corrosive on ingestion. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Lacrimation (tearing) and burning sensation of the mouth and throat are common. Signs and symptoms of acute exposure to isobutyronitrile may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry-red (and potentially bloody) mucous membranes; cardiac arrhythmias, and other cardiac abnormalities are common. Cyanosis (blue tint to skin and mucous membranes) may also be found. Tachypnea (rapid respiratory rate) may be followed by respiratory depression. Lung hemorrhage may occur. Headache, vertigo (dizziness), agitation, giddiness, salivation, nausea, and vomiting may be followed by combative behavior, convulsions, and coma. *Warning*: Heart palpitation may occur within minutes after exposure. High doses can stop breathing. Vital signs should be monitored closely. Caution is advised.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, Remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, immediately begin administering 100% oxygen to all victims. Monitor victims for respiratory distress. remove from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, evaluate vital signs and proceed as earlier in this section. Rush to a healthcare facility. Do not induce vomiting or attempt to neutralize. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **4 hours**: Teflon gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2284 Isobutyronitrile, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials.

Spill Handling:

Nitriles spill

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information

from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8
Keep sparks, flames, and other sources of ignition away. Establish forced ventilation to keep levels below explosive limit. Build dikes to control flow as necessary. Attempt to stop leak if this can be done without hazard. Use water spray to disperse vapors and dilute standing pools of liquid. Avoid breathing vapors. Keep upwind. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Wear positive pressure breathing apparatus and special protective clothing. Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Extinguish with dry chemical, carbon dioxide; water spray, foam, or fog. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Isolate for 1/2 mi in all directions if tank car or truck in involved in fire. Move container from fire area if you can do so without risk. Dike fire control water for later disposal; do not scatter the material. It is a flammable/combustible material and may be ignited by heat, sparks, or flames. Vapor explosion and poison hazard indoors, outdoors, or in sewers. Runoff to sewer may create fire or explosion hazard. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R26/27/28; R51/53; safety phrases: S1/2; S13; S28; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters.

Description: Isodrin is a crystalline solid. Molecular weight = 364.90; freezing/melting point = 241°C. Decomposes above 100°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. May be dissolved in flammable liquids.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this pesticide. An isomer of aldrin. See also "Aldrin" entry.

Incompatibilities: Incompatible with concentrated mineral acids; acid catalysts; acid oxidizing agents; phenols, reactive metals.

PELs in Air

PAC Ver. 29[138]

PAC-1: 0.64 milligram per cubic meter

PAC-2: 7 milligram per cubic meter

PAC-3: 42 milligram per cubic meter

Determination in Air: There is no OEL established for Isodrin. However, this chemical is an isomer of aldrin. See Aldrin.

Routes of Entry: Inhalation, ingestion, eyes and/or skin.

Harmful Effects and Symptoms

Short-Term Exposure: Isodrin is classified as extremely toxic. Probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and 2 teaspoonful for a 70 kg (150 lb) person. It causes renal damage and hyperactivity of sympathetic nervous system. Symptoms experienced are similar to poisoning by dieldrin and aldrin, including overall discomfort, headache, nausea, vomiting, dizziness, tremors, convulsions, rise in blood pressure; fever, disturbances in sleep and behavior; and rapid heartbeat. Death from respiratory arrest may occur in coma.

Long-Term Exposure: May cause dermatitis, skin rash, and acne. May cause liver and/or kidney damage.

Points of Attack: Liver, kidneys, skin.

Medical Surveillance: Liver function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry containers and cover/move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but may not ignite readily. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Fire and runoff from fire control water may produce Extinguish by using water spray, dry chemical, foam, or carbon dioxide. Use water to keep fire exposed containers cool. Wear full protective clothing including positive pressure breathing apparatus. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Cancer Classification: Group E, EPA, Cancer Classification: Group E Evidence of Noncarcinogenicity for Humans Evidence of Noncarcinogenicity for Humans. Note: This chemical has been associated with leukemia, a cancer of the blood cells (HSDB 6983, ref following study: Boros LG, Williams RD; Leuk, Res 25 (10): 883-90 (2001)].

DAlert: Poison, Neurotoxin (cumulative), Combustible liquid, Environmental hazard, Agricultural chemical.

All food tolerances for Isofenphos have been revoked, effective January 1999.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) DOT Inhalation Hazard Chemicals as organophosphates

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R40; R24/25; R33; R50/53; safety phrases: S1/2; S29/35; S36/ S37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: A colorless, oily liquid. Molecular weight = 345.4; specific gravity (H_2O:1) = 1.13 @ 20°C; boiling point = (decomposes) 220°C[Bayer]; freezing/melting point = −12°C; vapor pressure = 1.6×10^{-6} mmHg @ 20°C; flash point = 115°C; Explosive limits: LEL = 2.2%; UEL 18.8%. Low solubility in water; solubility = 23.8 mg/kg @ 20°C.

Potential Exposure: An organophosphate insecticide. Registered products containing isofenphos were voluntarily canceled in the United States in 1999. All food tolerances have been revoked in the United States Isofenphos was marketed under the basic producer's trade name, "Oftanol," and was used in the United States on turf and ornamental trees and shrubs to control white grubs, mole crickets, and other insects (mostly subterranean species). Isofenphos, was first registered in the United States in 1980 by Bayer Corporation for use on corn for control of the corn rootworm and was also used as a preemergence soil treatment in fruit crops and vegetables such as maize and carrots.

Incompatibilities: Sensitive to heat and moisture. Hydrolyzed by alkali solution. May react violently with antimony(V) pentafluoride. Incompatible with lead diacetate, magnesium, silver nitrate. In the presence of strong reducing agents such as hydrides, organophosphates form highly toxic and flammable phosphine gas. Contact with oxidizers can cause the release of toxic oxides of phosphorus. May react violently with aliphatic amines, alkalies, boranes, isocyanates, nitric acid, sulfuric acid.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame ionization detection; NIOSH IV, Method #5600, Organophosphorus Pesticides[18].

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = > 4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Low—116.60189 ppb, MATC.

Routes of Entry: Dermal contact, inhalation, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic in contact with skin or if swallowed. Can be absorbed through the unbroken skin. Eye pupils are small; blurred vision; eye watering; runny nose; cough; shortness of breath; salivation; dizziness; nausea, stomach cramps, diarrhea, and vomiting; increased blood pressure; profuse sweating; hypermotility, hallucinations; irritability; tingling of the skin; drowsiness; slow heartbeat; convulsions; fluid in lungs; loss of consciousness; incontinence; breathing stops; death. Organophosphates inhibit the action of acetylcholinesterase enzymes, and alter the way in which nervous impulses are transmitted. The effects can last for hours, days, or much longer. The action of the enzymes is reestablished after new enzymes are formed. LD_{50} (oral, rat) $= < 50$ mg/kg; LD_{50} (dermal, rat) $= < 200$ mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. A neurotoxin. Human toxicity (long term)[101]: High—3.50 ppb, Health Advisory.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, cardiovascular system, blood cholinesterase. This chemical is associated with human myeloid leukemia[193].

Medical Surveillance: This chemical is suspected of causing leukemia, cancer of the blood cells. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure

First Aid: Speed in removing material from eyes and skin is of extreme importance. *Eyes*: Eye contact can cause dangerous amounts of these chemicals to be quickly absorbed through the mucous membrane into the bloodstream. Immediately and gently flush eyes with plenty of warm or cold water (NO hot water) for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. *Skin*: Get medical aid. Dermal contact can cause dangerous amounts of these chemicals to be absorbed into the bloodstream. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Shampoo hair promptly if contaminated. *Ingestion*: Call poison control. Loosen all clothing. Never give anything by mouth to an unconscious person. Get medical aid. Do NOT induce vomiting. * If conscious, alert, and able to swallow, rinse mouth and have victim drink 4 to 8 oz of water do NOT induce vomiting but immediately administer slurry of activated charcoal (2 oz in 8 oz of water). If victim is *unconscious or having convulsions*, do nothing except keep victim warm. **In some cases you may be specifically instructed by poison control to induce vomiting by way of 2 tablespoons of syrup of ipecac (adult) washed down with a cup of water*. Do NOT give activated charcoal before or with ipecac syrup. *Inhalation*: Get medical aid. Do not contaminate yourself. Wearing the appropriate PPE equipment and respirator for organophosphate pesticides, immediately remove the victim from the contaminated area to fresh air. If the victim is not breathing, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, administer oxygen through bag/mask apparatus until medical help arrives. Do not leave victim unattended. *Note to physician or authorized medical personnel*. Administer atropine, 2 mg (1/30 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted;

repeat the administration of atropine every 3 to 8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse, hot and dry skin) occur; initiate treatment in children with 0.05 mg mg/kg of atropine; repeat at 5 to 10 minute intervals. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. *Notes to physician or authorized medical personnel*: *N*-methylpyridinium-2-aldoxime (2-PAMCI) when used in conjunction with atropine reacts with the phosphorylated cholinesterase, thereby restoring normal activity to by removing the phosphorylating group. The combination of these two chemicals is synergistic and must be administered within minutes to a few hours following exposure (depending on the specific agent) to be effective. Give 2-PAMCI (Pralidoxime; Protopam), 2.5 gm in 100 mL of sterile water or in 5% dextrose and water, intravenously, slowly, in 15−30 minutes; if sufficient fluid is not available, give 1 g of 2-PAMCI in 3 mL of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur. Also Diazepam, an anticonvulsant, might be considered

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. One recommendation is the use of DuPont Tychem suit fabrics[88] All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen and carbon. May be fatal if inhaled, ingested or absorbed through skin. Inhalation or contact with some of these materials will irritate or burn skin and eyes. Vapors may cause dizziness or suffocation. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destruction by alkali hydrolysis or incineration. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Isofluorophate I:0350

Formula: $C_6H_{14}FO_3P$

Synonyms: Diflupyl; Diflurophate; Diisopropoxyphosphoryl fluoride; *O,O*-Diisopropyl fluorophosphate; Diisopropyl fluorophosphate; Diisopropyl fluorophosphonate; Diisopropylfluorophosphoric acid ester; Diisopropylfluorphosphorsaeureester (German); Diisopropyl phosphofluoridate; Diisopropyl phosphorofluoridate; *O,O′*-Diisopropyl phosphoryl fluoride; DPF; Dyflos; Floropryl; Fluophosphoric acid, diisopropyl ester; Fluorodiisopropyl phosphate; Fluoropryl; Fluostigmine; Isofluorphate; Isoflurophate; Isopropyl fluophosphate; Isoproyl phosphorofluoridate; Neoglaucit; PF-3; Phosphorofluoridic acid, diisopropyl ester; T-1703; TL-466

CAS Registry Number: 55-91-4

HSDB Number: 2133

RTECS Number: TE5075000

UN/NA & ERG Number: (PIH) UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 200-247-6

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Combustible, Neurotoxin (cumulative), Dangerously water reactive, Environmental hazard

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P043

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

RQ = 100 lb (45.4 kg)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long-lasting effects.[291] Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R27/28; R33; R50/53; safety phrases: S1/2; S28; S29/35; S30; S35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)]

Description: Isoflurophate is an oily, colorless to faintly yellow liquid. Molecular weight = 184.17; boiling point = 62°C @ 9 mmHg; freezing/melting point = −82°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0₩. Slightly soluble in water; dangerous reaction releasing hydrofluoric acid.

Potential Exposure: An insecticide. This organophosphate compound is used as a research tool in neuroscience for its ability to inhibit cholinesterase (by phosphorylation) on an acute/sub-acute basis and to produce a delayed neuropathy. Formerly used as a basis for "nerve gases."

Incompatibilities: Forms hydrofluoric acid in the presence of water. In the presence of moisture attacks metals, rubbers, plastics, coatings and silica-containing materials, such as glass. Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrideds and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101].

PELs in Air

PAC Ver. 29[138]

PAC-1: 0.33 milligram per cubic meter

PAC-2: 3.6 milligram per cubic meter

PAC-3: 22 milligram per cubic meter

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Harmful Effects and Symptoms

Short-Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Isoflurophate is extremely toxic: probable oral lethal dose in humans is 5−50 mg/kg, between 7 drops and 1 teaspoonful for 70 kg person. Even traces of the vapor cause pinpoint pupils. High exposures may cause pulmonary edema.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Use positive pressure, pressure-demand, full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA (SCBA) with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and steam.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.3/0.4

Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200

Then: Protect persons downwind (mi/km)

Day 1.4/2.3

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: May burn but will not ignite readily. Thermal decomposition products may include hydrogen fluoride and oxides of phosphorus, nitrogen and carbon. Container may explode in heat of fire. Fire and runoff from fire control water may produce irritating or poisonous gases of fluorine and phosphorus oxides. Use dry chemical, carbon dioxide. For large fires, water spray, fog, or foam. Fight fire from maximum distance. Dike fire control water for later disposal. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number P043, must conform with USEPA regulations in storage, transportation, treatment and disposal of waste [40 CFR 240-280, 300-306, 702-799]. Potential for fluidized bed incineration with a temperature of 840−1800°C with residence times for liquids and gases: seconds; solids: longer. Potential candidate for rotary kiln incineration with a temperature of 1500−2900°C with residence times for liquids and gases: seconds; solids: hours. Potential candidate for liquid injection with a temperature of 1200−2900°C with a residence time of 0.1−2 seconds[72].

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R27/28; R50; safety phrases: S1/2; S28; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Isolan is a colorless liquid. Molecular weight = 211.30; boiling point = 103 °C @ 0.7 mm, and 117−118°C @ 2.5 mm.

Potential Exposure: This material is a systemic carbamate pesticide (aphicide). It is not registered as a pesticide in the United States Used in Europe.

Incompatibilities: Carbamates are incompatible with reducing agents, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas.

PELs in Air

PAC Ver. 29[138]

PAC-1: 0.51 milligram per cubic meter

PAC-2: 5.6 milligram per cubic meter

PAC-3: 34 milligram per cubic meter

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.7$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Ingestion, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Isolan is classified as extremely toxic. Probable oral lethal dose in humans is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 150 lb person. A cholinesterase inhibitor; although it is not an organic phosphate, it resembles that group in action. Can cause death due to respiratory arrest. Symptoms include cool extremities; trembling, fixed pinpoint pupils; nausea; vomiting, slight bluing of skin, lips and nailbeds; tearing, diarrhea, excessive salivation; sweating, slurring of speech; jerky movements; loss of bladder control; convulsions, coma and death.

Short-Term Exposure: A mutagen and may be carcinogenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Use positive pressure, pressure-demand full facepiece SCBA or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical resistant suit.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA (SCBA) with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2992 Carbamate pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid breathing vapors. Treat as a liquid carbamate pesticide. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use methods for liquid carbamate pesticides. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. As with other liquid carbamate pesticides, keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R35/36/38; R51; safety phrases: S16; S24/25; S26; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Isooctyl alcohol is a clear, combustible liquid. Molecular weight = 130.26; specific gravity (H_2O:1) = 0.83; boiling point = 186°C; freezing/melting point = < -76°C; vapor pressure = 0.4 mmHg @ 20°C; flash point = 82°C (oc); autoignition temperature = 277°C. Explosive limits: LEL = 0.9%; UEL: 5.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 0. Insoluble in water. Reaction with water.

Potential Exposure: It is used to form phthalate, maleate, adipate and sebacate esters with the corresponding acids for use as plasticizers. It is used as a raw material for surfactants and as an antifoaming agent, emulsifier and solvent.

Incompatibilities: Vapor or liquid forms explosive mixture with air. Contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine, and fluorine) can cause fire and explosion hazard. Incompatible with strong acids; caustics, amines, isocyanates. Attacks plastics.

PAC not available

Australia: TWA 50 ppm (270 milligram per cubic meter) [skin], 1993; Belgium: TWA 50 ppm (266 milligram per cubic meter) [skin], 1993; Denmark: TWA 50 ppm (270 milligram per cubic meter) [skin], 1999; France: VME 50 ppm (270 milligram per cubic meter) [skin], 1999; Norway: TWA 25 ppm (135 milligram per cubic meter), 1999; Russia: STEL 50 milligram per cubic meter, 1993; Switzerland: MAK-W 50 ppm (270 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 270 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 50 ppm [skin]. Russia[43] set a MAC for ambient air in residential areas of 0.15 milligram per cubic meter both on a momentary and a daily average basis. Several states have set guidelines or standards for *iso*-octyl alcohol in ambient air[60] ranging from 2.7 milligram per cubic meter (North Dakota) to 4.5 milligram per cubic meter (Connecticut) to 6.429 milligram per cubic meter (Nevada).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Isooctyl alcohol can affect you when breathed in and by passing through your skin. Exposure irritates the eyes, nose and throat, and possibly the lungs. Contact can irritate the skin and prolonged contact may cause skin burns. Contact can irritate and burn the eyes and cause possible permanent damage. Inhalation of the vapor can cause depression of the central nervous system; can cause dizziness, lightheadedness, headache, confusion, and unconsciousness. Exposure can cause nausea, vomiting, diarrhea, and irregular heartbeat.

Long-Term Exposure: Defats the skin, causing redness, drying and rash. May damage the liver and kidneys. Inhalation can cause lung irritation causing coughing and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system; liver and kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 50* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full facepiece powered-air purifying respirators. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, permanganates, chlorates, nitrates, and peroxides). Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN/NA1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required. Each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter or has a flash point above 60.5°C/141°F but below 93°C/200°F. A number with the prefix "NA" is not recognized for international shipments, except between the United States and Canada. It falls in Hazard Class "COMBUSTIBLE LIQUID".

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol resistant foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably in admixture with a more flammable solvent.

RTECS Number: EK4430000

UN/NA & ERG Number: UN1265/128

EC Number: 201-142-8 [*Annex I Index No.*: 601-006-00-1; 601-085-00-2]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Extremely flammable liquid, Environmental hazard.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

Canada, WHMIS, Ingredients Disclosure List (isopentane not listed) *n*-pentane Concentration 1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, T, N; risk phrases: R12; R51/53; safety phrases: S1; S2; S9; S16; S29; S33; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Isopentane is a volatile, colorless, watery liquid. It has a gasoline odor. Molecular weight = 72.17; specific gravity (H_2O:1) = 0.6 @ 20°C; boiling point = 20.2°C. Freezing point = −161°C; vapor pressure = 591 mmHg @ 21.1°C; flash point ≤ −51°C (cc); Autoignition temperature = 420°C. Flammability limits: LEL = 1.4%; UEL: 7.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 0. Insoluble in water.

Potential Exposure: Used as expanding or blowing agent in polystyrene foam beads; as a process solvent, chemical intermediate; in the manufacture of chlorinated derivatives; and as a antiknock additive in gasoline.

Incompatibilities: Highly volatile liquid; Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some paints, rubber and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

PELs in Air

NIOSH IDLH = 1500 ppm [LEL]

OSHA PEL: 1000 ppm/2950 milligram per cubic meter TWA

NIOSH REL: 120 ppm/350 milligram per cubic meter TWA

ACGIH TLV[1]: 600 ppm/1770 TWA

PAC Ver. 29[138]

PAC-1: 3000 ppm

PAC-2: 33,000 ppm

PAC-3: 2.00E + 05 ppm

DFG MAK: 1000 ppm/3000 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C

Austria: MAK 600 ppm (1899 milligram per cubic meter), 1999; Denmark: TWA 500 ppm (1500 milligram per cubic meter), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 600 ppm. United Kingdom[33] TWA 600 ppm (1800 milligram per cubic meter); STEL of 750 ppm (2250 milligram per cubic meter) (all isomers of pentane).

Determination in Air: Use NIOSH Analytical Method (IV) #1500, for Hydrocarbons.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can irritate the eyes and respiratory tract. Skin contact can cause a rash or burning sensation on contact. Can cause headache, nausea, weakness, dizziness, sleepiness, loss of coordination and loss of consciousness. Ingestion may cause aspiration into the lungs and chemical pneumonitis. May affect the central nervous systems.

Long-Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as pentane): *1,200 ppm*: Sa (APF = 10) (any supplied-air respirator). *1500 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1265 Pentanes, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isophorone, a cyclic ketone, is a colorless or pale liquid with a peppermint-like odor. The odor threshold is 5.4 ppm in water; 0.2 ppm in air. Molecular weight = 138.23; specific gravity (H_2O:1) = 0.93 @ 20°C; boiling point = 215 °C; freezing/melting point = −8°C; vapor pressure = 0.3 mmHg @ 20°C; 0.75 mmHg @ 33°C; flash point = 84°C (cc); autoignition temperature = 460°C. Explosive limits: LEL = 0.8%; UEL: 3.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Slightly soluble in water; solubility = 1%.

Potential Exposure: Isophorone is an industrial chemical synthesized from acetone and used commercially as a solvent or cosolvent for polyvinyl and nitro-cellulose resins, pesticides, herbicides, fats, oils, and gums. It is used as a solvent and emulsifier; in some printing inks, paints, lacquers, and adhesives. It is also used as a chemical feedstock for the synthesis of 3,5-xylenol, 2,3,5-trimethyl-cyclohexanol, and 3,5-dimethylaniline. Although this is an industrial chemical, it also occurs naturally in cranberries.

Incompatibilities: May form explosive mixture with air. Strong oxidizers may cause fire and explosions. Incompatible with aliphatic amines. Attacks some plastics, resins, and rubber.

PELs in Air

NIOSH IDLH = 200 ppm

Conversion factor: 1 ppm = 5.65 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.2 ppm

OSHA PEL: 25 ppm/140 milligram per cubic meter TWA

NIOSH REL: 4 ppm/23 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/28 milligram per cubic meter TWA Ceiling Concentration; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 12 ppm

PAC-2: 33 ppm

PAC-3: 200 ppm

DFG MAK: 2 ppm/11 milligram per cubic meter TWA; Peak Limitation Category I(2); Carcinogen Category 3B; Pregnancy Risk Group C.

Australia: TWA 5 ppm (25 milligram per cubic meter), 1993; Austria: MAK 5 ppm (28 milligram per cubic meter), 1999; Belgium: STEL 5 ppm (28 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (25 milligram per cubic meter), 1999; Finland: TWA 5 ppm (28 milligram per cubic meter); STEL 10 ppm (56 milligram per cubic meter), 1999; France: VLE 5 ppm (25 milligram per cubic meter), 1999; the Netherlands:

MAC-25 milligram per cubic meter, 2003; the Philippines: TWA 25 ppm (140 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC 25 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, 1993; Sweden: KTV 5 ppm (30 milligram per cubic meter), 1999; Switzerland: MAK-W 5 ppm (28 milligram per cubic meter), 1999; Turkey: TWA 25 ppm (149 milligram per cubic meter), 1993; United Kingdom: STEL 5 ppm (29 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 5 ppm. Several states have set guidelines or standards for isophorone in ambient air[60] ranging from 83.3 μ/m^3 (New York) to 200.0 μ/m^3 (Virginia) to 250.0 μ/m^3 (North Dakota and South Carolina) to 460.0 μ/m^3 (Connecticut) to 595 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #2508; #2556; OSHA Analytical Method 7.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 100 μg/L; State Drinking Water Guidelines: Florida 37 μg/L; Maine 370 μg/L; Minnesota 100 μg/L; New Hampshire 100 μg/L.

Determination in Water: Methylene chloride extraction followed by exchange to toluene, gas chromatography with flame ionization detection (EPA Method 609) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: $\text{Log } K_{\text{ow}} = 1.7$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Because of the odor and taste of isophorone, ingestion is not expected unless by accident.

Harmful Effects and Symptoms

Short-Term Exposure: Isophorone can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Exposure may cause headaches, nausea, and a drunken feeling. Higher levels can cause you to pass out. Contact can burn the eyes, causing permanent damage. Exposure can irritate the eyes, nose, and throat. Repeated exposure may cause chronic irritation with eye and nasal discharge. Long-term exposure can cause drying and cracking of the skin.

Long-Term Exposure: Repeated or prolonged contact will cause dry skin, cracking; dermatitis. May cause chronic irritation of the eyes and nose, with discharge. May cause liver and kidney damage. Many solvents and other, similar petroleum-based chemicals have been shown to cause brain or other nerve damage. Some animal studies suggest that isophorone may cause birth defects and slower growth in the offspring of rats and mice that breathed the vapors during pregnancy. These studies found some harmful health effects in adult female animals. High doses fed to male rats caused kidney disease, and tumors of the kidney, liver; and lymph and reproductive glands.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests. If symptoms develop or overexposure is suspected, the following may be useful: examination of the eyes and nose for chronic inflammation, kidney function tests. Liver function tests. Interview for brain effects and refer positive and borderline individuals for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours**: Responder suits. **4 hours**: polyvinyl alcohol gloves; 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 40 ppm*: CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator).* *up to 100 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)].* *up to 200 ppm*: CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SaT:Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isophorone must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required. Each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter or has a flash point above 60.5°C/141°F but below 93°C/200°F. A number with the prefix "NA" is not recognized for international shipments, except between the United States and Canada. It falls in Hazard Class "COMBUSTIBLE LIQUID".

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; Xi; risk phrases: R23; R36/37/39; R42/43; R51/53; R61; safety phrases: S1/2; S26; S28; S29/35; S38; S41; S45; S61.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Isophorone diisocyanate is a colorless to yellowish liquid. An unpleasant, pungent odor. Molecular weight = 222.32; specific gravity (H_2O:1) = 1.06 @ 20°C; boiling point = 360 °C; freezing/melting point = −60°C; vapor pressure = 3×10^{-4} mmHg @ 25°C; flash point = 155°C (cc) ; autoignition temperature = 430°C; Explosive limits: LEL = 0.7%; UEL: 4.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 1. Decomposes in water (soluble).

Potential Exposure: Isophorone diisocyanate is used as a raw material for polyurethane paints, varnishes and elastomers which are exceptionally stable to atmospheric and chemical attack.

Incompatibilities: May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acyl-chlorides may cause explosive polymerization. Contact with metals may evolve flammable hydrogen gas. Attacks some plastics, rubber and coatings. Contact with metals may evolve flammable hydrogen gas. May accumulate static electrical charges, and may cause ignition of its vapors.

PELs in Air

Conversion factor: 1 ppm = 9.09 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.005 ppm/0.045 milligram per cubic meter TWA; 0.02 ppm/0.18 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.005 ppm/0.045 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 0.02 ppm

PAC-2: 0.14 ppm

PAC-3: 0.6 ppm

DFG MAK: 0.005 ppm/0.046 milligram per cubic meter TWA; Peak Limitation Category I(1), a momentary value of 0.01 mL/m^3/0.092 milligram per cubic meter should not be exceeded; [skin] danger of sentization of the airways and the skin; Pregnancy Risk Group D

Austria: MAK 0.01 ppm (0.09 milligram per cubic meter), 1999; Belgium: TWA 0.005 ppm (0.045 milligram per cubic meter) [skin], 1993; Denmark: TWA 0.005 ppm (0.045 milligram per cubic meter) [skin], 1999; France: VME 0.01 ppm (0.09 milligram per cubic meter), VLE 0.02 ppm (0.18 milligram per cubic meter), 1999; Norway: TWA 0.005 ppm (0.045 milligram per cubic meter), 1999; Switzerland: MAK-W 0.01 ppm (0.09 milligram per cubic meter), KZG-W 0.02 ppm (0.18 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.05 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.005 ppm. Several states have set guidelines or standards for IPDI in ambient air[60] ranging from 0.09 μ/m^3 (Connecticut) to 1.5 μ/m^3 (Virginia) to 9.0 μ/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method #5525; OSHA Analytical Method PV-2034.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate and burn the skin and eyes. Permanent eye damage may result. Inhalation can cause coughing, wheezing, shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Isocyanates can cause itching and skin rashes, tearing of the eyes; inflammation of the mucous membrane of the nose; and lung problems. This material is highly toxic by inhalation and moderately toxic through the skin. People with skin or respiratory problems should avoid exposure. LD_{50} (oral, rat) $= < 5$ g/kg.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy with itching and skin rash. Isophorone diisocyanate may cause an asthma-like allergy. Future exposures can cause asthma attacks with shortness of breath; wheezing, cough, and/or chest tightness. Permanent damage to the lungs could also occur. Permanent lung damage may occur, even if no allergic symptoms are noticed.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal if person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours**: butyl rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl alcohol gloves; Viton gloves, suits; Responder suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 0.05 ppm*: Sa (APF = 10) (any supplied-air respirator).* *up to 0.125 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *up to 0.25 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, alcohol, phenols; amines, urethanes; mercaptans and ureas.

Shipping: UN2290 Isophorone diisocyanate, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard.

Spill Handling: Avoid inhalation. Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors−contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn, but does not readily ignite. Thermal decomposition products may include oxides of nitrogen and carbon. *Small fire*: use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: Isoprene is a colorless liquid with a mild petroleum-like odor. Vapor is heavier than air; will collect in low areas. The odor threshold is 0.005 ppm. Molecular weight = 68.13; specific gravity (H_2O:1) = 0.68 @ 20°C; boiling point = 34 °C; freezing/melting point = −147°C; vapor pressure = 400 mmHg@ 550°C; flash point = −54°C; autoignition temperature = 395°C. Explosive limits: LEL = 1.5%; UEL: 8.9%[17]. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 2. Insoluble in water.

Potential Exposure: Isoprene is used in the manufacture of synthetic rubber and in elastomer plastics; in the production of *cis*-1,4-polyisoprene rubber, styrene/isoprene/styrene block polymers.

Incompatibilities: Isoprene is a highly flammable and reactive liquid, and a dangerous fire and explosive hazard. Store under inert atmosphere (preferably nitrogen) with at least 50 ppm *tert*-butylcatechol present as an inhibitor. May form explosive mixture with air. Air contact forms explosive peroxides; heat, buildup of peroxides; and contact with many materials may cause violent polymerization, with fire or explosion hazard. Violent reaction with oxidizers, strong acids; reducing agents; strong bases; acid chlorides; alcohols, causing fire and explosion hazard. Attacks some paints, rubber, and coatings. May accumulate static electrical charges and may cause ignition of its vapors.

PELs in Air

PAC* Ver. 29[138]

PAC-1: $\mathbf{5}_{\mathbf{E}}$ ppm

PAC-2: $\mathbf{1000}_{\mathbf{E}}$ ppm

PAC-3: $\mathbf{4000}_{\mathbf{E}}$ ppm

DFG MAK: 3 ppm/8.5 milligram per cubic meter TWA; Peak Limitation Category II(8); Pregnancy Risk Group C; Germ Cell Mutagen Category 5; Carcinogen Category 5

Poland: MAC (TWA) 100 milligram per cubic meter, MAC (STEL) 300 milligram per cubic meter, 1999; Russia: STEL 40 milligram per cubic meter, 1993. Russia has set[35] a MAC in ambient air in residential areas of 0.04 milligram per cubic meter on a once-daily basis.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.005 mg/L and surface water used for fishery purposes of 0.01 mg/L.

Routes of Entry: Inhalation, eyes and/or skin.

Harmful Effects and Symptoms

Short-Term Exposure: Exposure can irritate the eyes, skin, and respiratory tract. Contact irritates the eyes and skin. Higher levels can affect the central nervous system and cause dizziness, lightheadedness, confusion, and unconsciousness.

Long-Term Exposure: Lungs may be affected by repeated or prolonged exposure; bronchitis may develop. There is limited evidence that isoprene can cause cancer of the testes in animals, in high concentrations. This substance is possibly carcinogenic to humans. High exposures may affect blood cells.

Points of Attack: Lungs, blood cells.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests, CBC, consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to isoprene exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isoprene must be stored to avoid contact with strong acids (such as chlorosulfonic, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, flame and oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where isoprene is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of isoprene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment especially when opening and closing containers of isoprene. Wherever isoprene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1218 Isoprene, inhibited, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable and reactive liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or polymer foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed[22].

Isopropanolamine Dodecylbenzene Sulfonate I:0430

Formula: $C_{18}H_{30}O_3S \cdot C_3H_9NO$

Synonyms: Benzenesulfonic acid, 4-dodecyl-, compound with 1-amino-2-propanol (1:1); Isopropaneolamine salt of dodecylbenzenesulfonate; Isopropanolamine dodecyl benzenesulfonate

CAS Registry Number: 42504-46-1; 54590-52-2

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 255-854-9

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Environmental hazard

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).

Description: Isopropanolamine dodecylbenzenesulfonate is a white to light yellow granular solid. Molecular weight = 385.5; 401.61; vapor pressure = 13–15 mmHg @20°C; flash point = > 149°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: Isopropanolamine dodecylbenzenesulfonate is used as a surface active ingredient in soaps and detergents; used in the fragrance industry

Incompatibilities: Salts, basic, such as isopropanolamine dodecylbenzene sulfonate, are generally soluble in water. The resulting solutions contain moderate concentrations of hydroxide ions and have pH's greater than 7.0. They react as bases to neutralize acids. These neutralizations generate heat, but less or far less than is generated by neutralization of the bases in reactivity group 10 (Bases) and the neutralization of amines. They usually do not react as either oxidizing agents or reducing agents but such behavior is not impossible[101].

PELs in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Can irritate and burn the eyes and skin on contact. Inhalation can cause irritation of the nose and throat with coughing and wheezing.

Long-Term Exposure: Unknown at this time.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lense at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: The primary hazard is the threat to the environment. Immediate steps should be taken to limit its spread to the environment. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch or walk through spilled material. Stop leak if you can do it without risk. Prevent dust cloud. Avoid inhalation of asbestos dust. SMALL DRY SPILL: With clean shovel place material into clean, dry container and cover loosely; move containers from spill area. SMALL SPILL: Take up with sand or other noncombustible absorbent material and place into containers for later disposal. LARGE SPILL: Dike far ahead of liquid spill for later disposal. Cover powder spill with plastic sheet or tarp to minimize spreading. Prevent entry into waterways, sewers, basements or confined areas[117]. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is may burn but does not easily ignite. Thermal decomposition products may include oxides of sulfur and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

2-Isopropoxyethanol I:0440

Formula: $C_5H_{12}O_2$

Synonyms: Dowanol Eipat; Ethanol, isopropoxy-; Ethylene glycol isopropyl ether; Ethylene glycol, monoisopropyl ether; β-Hydroxyethyl isopropyl ether; IPE; Isopropoxyethanol; Isopropyl cellosolve; Isopropyl glycol; Isopropyloxitol; 2-(1-Methylethoxy)ethanol; Monoisopropyl ether of ethylene glycol

CAS Registry Number: 109-59-1

HSDB Number: 2831

RTECS Number: KL5075000

UN/NA & ERG Number: UN2929/131; UN3271 (ethers)/127

EC Number: 203-685-6 [*Annex I Index No.*: 603-013-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Possible polymerization hazard (glycol ethers),; Reproductive toxin, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R6; R10; R19; R20/21; R3637/38; safety phrases: S2; S24/25; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

As glycol ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono- and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol R-$(OCH_2CH_2)_n$-OR′; where $n = 1$, 2, or 3; R = alkyl or aryl groups; R′ = R, H, or groups which, when removed, yield glycol ethers with the structure: R-$(OCH_2CH)_n$-OH. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. R-$(OCH_2CH_2)_n$-OR′; where $n = 1$, 2, or 3; R = alkyl C7 or less; or R = phenyl or alkyl substituted phenyl; R′ + H, or alkyl C7 or less; or consisting of carboxylic ester, sulfate, phosphate, nitrate or sulfonate. Form R *de minimis* concentration reporting level: 1.0%.

Description: Isopropoxyethanol is a clear, colorless liquid with an ethereal odor. Molecular weight = 104.14; specific gravity (H_2O:1) = 0.9; boiling point = 139.4°C. Vapor pressure = 3 mmHg @ 20°C; flash point = 33°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 1. Soluble in water.

Potential Exposure: Used in lacquers and other coatings; and as a solvent for resins, dyes, and textiles.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May slowly form reactive peroxides during prolonged storage or on exposure to air and light.

PELs in Air

OSHA PEL: None

NIOSH REL: None established; See *NIOSH Pocket Guide*, Appendix D.

ACGIH TLV[1]: 25 ppm/106 gm/m^3 TWA [skin]

PAC not available

DFG MAK: 5 ppm/22 milligram per cubic meter TWA; Peak Limitation Category II(8) [skin]; Pregnancy Risk Group C

Australia: TWA 25 ppm (105 milligram per cubic meter), 1993; Austria: MAK 5 ppm (22 milligram per cubic meter) [skin], 1999; Belgium: TWA 25 ppm (106 milligram per cubic meter), 1993; Denmark: TWA 25 ppm (105 milligram per cubic meter), 1999; France: VME 25 ppm (105 milligram per cubic meter), 1999; Norway: TWA 20 ppm (80 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 44 milligram per cubic meter, 2003; MAC-TGG 44 milligram per cubic meter [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 25 ppm [skin]

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate and burn the eyes and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. High exposure through skin contact or inhalation can cause severe damage to the kidneys, blood, and liver. This can cause bloody urine and death.

Long-Term Exposure: Exposure can cause anemia. Prolonged contact can degrease and irritate the skin; may cause drying and cracking. Very irritating substances, such as IPE may affect the lungs.

Points of Attack: Eyes, skin, respiratory system; blood.

Medical Surveillance. Lung function tests. Liver and kidney function tests. CBC. urinalysis. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. The use of alcoholic beverages may enhance the toxic effect.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3271 Ethers, n.o.s., Hazard class: 3; Labels: 3-Flammable liquid, Technical Name Required. UN2929 Toxic liquids, flammable, organic, n.o.s., Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Isopropyl Acetate I:0450

Formula: $C_5H_{10}O_2$: $CH_3COOCH(CH_3)_2$

Synonyms: Isopropylacetat (German); Isopropyl (acetate d') (French); Isopropyl ester of acetic acid; 1-Methylethyl acetate; 1-Methylethyl ester of acetic acid; *sec*-Propyl acetate; 2-Propyl acetate

CAS Registry Number: 108-21-4

HSDB Number: 159

RTECS Number: AI4930000

UN/NA & ERG Number: UN1220/129

EC Number: 203-561-1 [*Annex I Index No.*: 607-024-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: F; risk phrases: R11; R36; R66; R67; safety phrases: S2; S16; S21; S26; S29; S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isopropyl acetate is a colorless liquid with a fruity odor. Molecular weight = 102.15; specific gravity (H_2O:1) = 0.87; boiling point = 88.4°C; freezing/melting point = −68.8°C; vapor pressure = 40 mmHg @ 17°C; flash point = 2.2°C; autoignition temperature = 460°C. Explosive limits: LEL = 1.8% @ 38°C; 10,000 ppm[138]; UEL: 8.0%[17]. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Moderately soluble in water; solubility = 3%.

Potential Exposure: This material is used as an organic solvent for nitrocellulose and other resins, fats, oils, waxes and gums. It is used in synthetic perfumes and food flavorings.

Incompatibilities: May form explosive mixture with air. Contact with strong oxidizers may cause fire and explosions. Incompatible with strong acids; caustics, nitrates. Dissolves rubber and many plastic materials. Contact with steel may cause slow decomposition. May accumulate static electrical charges, and may cause ignition of its vapors.

PELs in Air

NIOSH IDLH = 1800 ppm

Conversion factor: 1 ppm = 4.18 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 4.1 ppm

OSHA PEL: 250 ppm/950 milligram per cubic meter TWA

NIOSH REL: None established; See Appendix D of the *NIOSH Pocket Guide*

ACGIH TLV[1]: 100 ppm/418 milligram per cubic meter TWA; 200 ppm/950 milligram per cubic meter STEL (2001).

PAC Ver. 29[138]
PAC-1: 200 ppm
PAC-2: 2700 ppm
PAC-3: 16,000 ppm (LEL, lower explosive limit)
DFG MAK: 100 ppm/420 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.
Australia; TWA 200 ppm (950 milligram per cubic meter); STEL 310 ppm, 1993; Austria: MAK 200 ppm (840 milligram per cubic meter), 1999; Belgium: TWA 250 ppm (1040 milligram per cubic meter); STEL 310 ppm (1290 milligram per cubic meter), 1993; Denmark: TWA 150 ppm (625 milligram per cubic meter), 1999; France: VME 250 ppm (950 milligram per cubic meter), VLE 300 ppm (1140 milligram per cubic meter), 1999; Hungary: TWA 400 milligram per cubic meter; STEL 800 milligram per cubic meter, 1993; Norway: TWA 100 ppm (240 milligram per cubic meter), 1999; the Philippines; TWA 250 ppm (950 milligram per cubic meter), 1993; Switzerland: MAK-W 200 ppm (840 milligram per cubic meter), KZG-W 400 ppm (1680 milligram per cubic meter), 1999; United Kingdom: STEL 200 ppm (849 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 310 ppm. Several states have set guidelines or standards for isopropyl acetate in ambient air[60] ranging from 1.4 milligram per cubic meter (Massachusetts) to 3.3 milligram per cubic meter (New York) to 9.5−11.85 milligram per cubic meter (North Dakota) to 16.0 milligram per cubic meter (Virginia) to 19.0 milligram per cubic meter (Connecticut) to 22.619 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH (IV), Method #1454, #1460; OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Health effects can occur below the legal exposure limit. Eye contact can cause severe irritation or burns. The vapors can cause eye, nose and throat irritation. Coughing and chest tightness can also occur. Higher levels cause headaches, drowsiness, poor coordination and passing out. Ingestion may cause chemical pneumonitis.

Long-Term Exposure: Repeated exposure can cause dry, cracking skin and may damage the liver. Can irritate the lungs and may cause bronchitis to develop. Although this chemical has not been adequately evaluated, many solvents and similar petroleum-based chemicals have been shown to cause brain or other nerve damage.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests; evaluation for brain effects. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1800 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from nitrates and strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric, and nitric) and strong alkalis. Sources of ignition, such as smoking and open flames, are prohibited where isopropyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of isopropyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isopropyl acetate.

Shipping: UN1220 Isopropyl acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isopropyl alcohol is a flammable liquid with a slight odor resembling that of a mixture of ethanol and acetone. The odor threshold is 22 ppm. Molecular weight = 60.11; specific gravity (H_2O:1) = 0.79; boiling point = 82.3°C; freezing/melting point = −79.5°C; vapor pressure = 33 mmHg @ 20°C; 75 mmHg @ 34°C; flash point = 12°C; autoignition temperature = 399°C. Explosive limits: LEL = 2.0%; 13,000 ppm[138]; UEL: 12.7% @ 93°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Soluble in water.

Potential Exposure: Isopropyl alcohol is a chemical widely used as an analytical reagent and to manufacture acetone, glycerol and isopropyl acetate; in liniments, skin lotions, cosmetics, permanent wave preparations; pharmaceuticals, and hair tonics. It is also employed as a solvent in perfumes, in extraction processes; as a preservative; in lacquer formulations; and in many dye solutions. In addition, it has been employed as an ingredient of antifreezes, soaps, and window cleaners. It may also be used as a raw material for the manufacture of various isopropyl derivatives, such as pesticides.

Incompatibilities: May form explosive mixture with air. Incompatible with alkaline earth and alkali metals; crotonaldehyde, phosgene, strong acids; amines, ammonia, caustics, strong oxidizers. Attacks some plastics, rubber and coatings. Reacts with metallic aluminum at high temperatures.

PELs in Air

PAC-3: 12,000 ppm [>50% LEL but <100% LEL = 13,000]

DFG MAK: 200 ppm/500 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group C; BAT 50 mg[acetone]/L blood/end-of-shift; 50 mg[acetone]/L urine/end-of-shift; Pregnancy Risk Group C

Australia: TWA 400 ppm (980 milligram per cubic meter); STEL 500 ppm, 1993; Austria: MAK 400 ppm (980 milligram per cubic meter), 1999; Belgium: TWA 400 ppm (985 milligram per cubic meter); STEL 500 ppm, 1993; Denmark: TWA 200 ppm (490 milligram per cubic meter), 1999; France: VLE 400 ppm, 1999; Japan: STEL 400 ppm (980 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 650 milligram per cubic meter, 2003; the Philippines: TWA 400 ppm (980 milligram per cubic meter), 1993; Poland; MAC (TWA) 900 milligram per cubic meter, MAC (STEL) 1200 milligram per cubic meter, 1999; Russia: STEL 400 ppm (10 milligram per cubic meter), 1993; Sweden: NGV 150 ppm (350 milligram per cubic meter), KTV 250 ppm (600 milligram per cubic meter), 1999; Switzerland: MAK-W 400 ppm (980 milligram per cubic meter), KZG-W 800 ppm (1960 milligram per cubic meter), 1999; Turkey: TWA 200 ppm (500 milligram per cubic meter), 1993; United Kingdom: TWA 400 ppm (999 milligram per cubic meter); STEL 500 ppm (1250 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 500 ppm. Russia[43] has set MAC values in the ambient air of residential areas of 0.6 milligram per cubic meter both on a momentary and on a daily average basis. Several states have set guidelines or standards for isopropanol in ambient air[60] ranging from 3.267 milligram per cubic meter (New York) to 9.8 milligram per cubic meter (Florida) to 9.8−12.25 milligram per cubic meter milligram per cubic meter (North Dakota) to 16.5 milligram per cubic meter (Virginia) to 19.6 milligram per cubic meter (Connecticut, South Dakota) to 23.333 milligram per cubic meter (Nevada).

Determination in Air: Charcoal adsorption, workup with 2-butanol in CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1400[18].

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 13,500 μg/L based on health effects. Russia[43] set a MAC in water bodies used for domestic purposes of 0.25 mg/L. Maryland[61] has set a guideline for isopropanol in drinking water of 3.0 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Isopropyl alcohol irritates the eyes, skin, and respiratory tract. *Inhalation*: Irritation of the nose and throat may occur @ 400 ppm and above. *Skin*: 5% solution may cause irritation and dryness. *Eyes*: Vapor levels of 20 ppm or above may result in irritation. Liquid may cause corneal burns and eye damage. *Ingestion*: 22.5 mL (2/3 oz) has caused salivation, reddening of face; stomach pain; depression, dizziness, headache, vomiting and unconsciousness. Ingestion of 100 mL (3 oz) has caused death.

Long-Term Exposure: Repeated or prolonged contact may cause dry, cracking skin. There is an increased incidence of nasal sinus cancer in workers involved in the manufacture of IPA by the strong acid process. Although this chemical has not been adequately evaluated, many solvents and similar petroleum-based chemicals have been shown to cause brain or other nerve damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite). Also, NIOSH recommends that workers subject to isopropyl alcohol exposure have comprehensive preplacement medical examinations. Periodic medical examinations shall be made available on an annual basis. Particular attention will be given in these medical examinations to the skin sinuses, and respiratory system. Isopropyl alcohol and its metabolite, acetone, may be detected in blood, urine, and body tissues. Evaluation for brain effects. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours**: butyl rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; Viton gloves, suits; 4H and Silver Shield gloves, CPF3 suits; Responder suits. **4 hours**: Neoprene rubber gloves, suits, boots; Teflon gloves, suits, boots Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isopropyl alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where isopropyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of isopropyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isopropyl alcohol.

Shipping: UN1219 Isopropanol or Isopropyl alcohol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Isopropylamine I:0470

Formula: C_3H_9N; $(CH_3)_2CHNH_2$
Synonyms: 1-Amino-2-hydroxypropane; 2-Aminopropane; 1-Amino-propanol-2; 2-Amonopropan (German); 2-Hydroxy propylamine; Isopropilamina (Spanish); Isopropyl amine; 1-Methylethylamine; Monoisopropylamine; 2-Propanamine; *sec*-Propylamine
CAS Registry Number: 75-31-0
HSDB Number: 804
RTECS Number: NT8400000
UN/NA & ERG Number: UN1221/132
EC Number: 200-860-9 [*Annex I Index No.*: 612-007-00-1]
Regulatory Authority and Advisory Information
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).
Hazard Alert: Possible risk of forming tumors, Corrosive, Primary irritant (w/o allergic reaction).
Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard symbols, risk, & safety statements: Hazard symbol: F+, C, Xi; risk phrases: R12; R34; R36/37/38; safety phrases: S1; S2; S16; S24/25; S26; S27; S29; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Isopropylamine is a colorless liquid with a pungent ammonia-like odor. A gas above the boiling point. The odor threshold is 0.21 ppm. Molecular weight = 59.13; specific gravity (H_2O:1) = 0.69; boiling point = 34.4°C; freezing/melting point = −101°C; vapor pressure = 460 mmHg @ 20°C; flash point = −37°C; autoignition temperature = 402°C. Explosive limits: LEL = 2.0%; UEL: 10.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, flammability 4, reactivity 0. Soluble in water.
Potential Exposure: Isopropyl amine is used to produce rubber accelerators, oil-soluble emulsifiers; in the synthesis of pharmaceuticals; pesticides, dyes and surface active agents.
Incompatibilities: May form explosive mixture with air. A strong base. Reacts with alkali metals; alkaline earth; acid anhydrides; acid chlorides. Reacts violently with strong oxidizers (fire and explosions), strong acids (explosive spattering); nitroparaffins, halogenated hydrocarbon; aldehydes, ketones, epoxides, and many other substances. Attacks some plastics, rubber and coatings. Attacks copper and its compounds, lead, zinc, tin.
PELs in Air
NIOSH IDLH = 750 ppm
Conversion factor: 1 ppm = 2.42 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: 5 ppm/12 milligram per cubic meter TWA
NIOSH REL: None established; See Appendix D of the *NIOSH Pocket Guide*
ACGIH TLV[1]: 5 ppm/12 milligram per cubic meter TWA; 10 ppm/24 milligram per cubic meter STEL
PAC Ver. 29[138]
PAC-1: 10 ppm
PAC-2: 670 ppm
PAC-3: 4000 ppm
DFG MAK: 5 ppm/12 milligram per cubic meter TWA; Peak Limitation Category I(2), a momentary value of 10 mL/m^3/25 milligram per cubic meter should not be exceeded; Pregnancy Risk Group C.
Australia: TWA 5 ppm (12 milligram per cubic meter); STEL 10 ppm, 1993; Austria: MAK 5 ppm (12 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (12 milligram per cubic meter); STEL 10 ppm (24 milligram per cubic meter), 1993; Denmark: TWA 5 ppm (12 milligram per cubic meter), 1999; France: VME 5 ppm (12 milligram per cubic meter), 1999; Norway: TWA 5 ppm (12 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 12 milligram per cubic meter, 2003; Poland: MAC (TWA) 12 milligram per cubic meter, MAC (STEL) 24 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, 1993; Sweden: TWA 5 ppm (12 milligram per cubic meter); STEL 10 ppm (25 milligram per cubic meter), 1999; Switzerland: MAK-W 5 ppm (12 milligram per cubic meter), KZG-W 10 ppm (24 milligram per cubic meter), 1999; Turkey: TWA 5 ppm (12 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 ppm. The OSHA PEL is 5 ppm TWA. NIOSH, the DFG MAK[3] and the ACGIH[1] TWA value is 5 ppm (12 milligram per cubic meter) and the STEL is 10 ppm (24 milligram per cubic meter). Russia[43] set a MAC in work-place air of 1.0 milligram per cubic meter and Russia set a MAC value for ambient air in residential areas of0.01 milligram per cubic meter. Several states have set guidelines or standards for monoisopropylamine in ambient air[60] ranging from 40 μ/m^3 (New York) to 120 μ/m^3 (Florida) to 120−240 μ/m^3 (Nevada) to 300 μ/m^3 (South Carolina).
Determination in Air: Use NIOSH II(3), Method #S147.
Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 2.0 mg/L.
Routes of Entry: Inhalation, ingestion, skin absorption, eye and/or skin contact.
Harmful Effects and Symptoms
Short-Term Exposure: Isopropylamine is corrosive to the eyes, skin, and respiratory tract. Contact with the liquid or vapor can cause severe burns of the eyes and skin; can cause blurred vision or seeing halos around lights, with loss of vision and scarring. Corrosive on ingestion. Swallowing

the liquid may cause chemical pneumonitis. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Repeated or prolonged contact can cause thickening and cracking of the skin. Repeated exposure can cause loss of vision and scarring. Can irritate the lungs and may cause bronchitis.

Points of Attack: Lungs, eyes.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests, exam of the eyes and vision. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 hours**: Tychem 1000 suits. **4 hours**: Teflon gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *125 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode)$^{£}$; or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern $^{£}$]. *250 ppm*: CcrFS (APF = 50) [Any air-purifying full facepiece respirator equipped with cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister protection against the compound of concern]; or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *750 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Isopropylamine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates) and strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where isopropylamine is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of isopropylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of isopropylamine. Wherever isopropylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Isopropylamine will attack some forms of plastics, rubber and coatings.

Shipping: UN1221 Isopropylamine, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

N-Isopropyl Aniline I:0480

Formula: $C_9H_{13}N$; $C_6H_5NHCH(CH_3)_2$

Synonyms: Aniline, *o*-isopropyl-; Benzenamine, *N*-(1-methylethyl)-; 2-Isopropyl aniline; Isopropylaniline; *N*-(1-Methylethyl)-benzenamine; *N*-IPA; *N*-Phenylisopropylamine

CAS Registry Number: 768-52-5

HSDB Number: 6133

RTECS Number: BY4200000

UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: 212-196-7

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R10; R16; R22; R23; R36/37/38; R40; safety phrases: S7/9; S16; S26; S36/37; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Isopropyl aniline is a yellowish liquid with a sweet, aromatic odor. Molecular weight = 135.23; specific gravity (H_2O:1) = 0.93 @15.6°C; boiling point = 202.6°C; freezing/melting point = −50°C; vapor pressure = 0.03 mmHg @ 20°C; flash point = 82 to 87.7°C. Insoluble in water.

Potential Exposure: *N*-isopropyl aniline is used in the dyeing of acrylic fibers and as a chemical intermediate.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

PELs in Air

Conversion factor: 1 ppm = 5.53 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 2 ppm/10 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 2 ppm/11 milligram per cubic meter TWA [skin]; BEIM issued for methemoglobin inducers.

PAC not available

Australia: TWA 2 ppm (10 milligram per cubic meter) [skin], 1993; Belgium: TWA 2 ppm (11 milligram per cubic meter) [skin], 1993; Denmark: TWA 2 ppm (10 milligram per cubic meter) [skin], 1999; France: VME 2 ppm (10 milligram per cubic meter) [skin], 1999; Norway: TWA 2 ppm (11 milligram per cubic meter), 1999; Switzerland: MAK-W 2 ppm (11 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 ppm [skin]. North Dakota has set a standard for *N*-Isopropyl aniline in ambient air or 100 μ/m^3[60].

Determination in Air: Use OSHA Analytical Method 78.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *N*-Isopropyl aniline reduces the blood's ability to supply oxygen to the body, resulting in formation of methemoglobin. Exposure can cause cyanosis (the lips, ears, and other skin areas turn blue). The effects may be delayed. It can also cause headaches and lightheadedness. High exposures can cause trouble breathing; collapse, and even death. Contact may irritate the eyes and skin.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization. Repeated high exposures may cause headaches, dizziness, poor appetite, and anemia.

Points of Attack: Eyes, skin, respiratory system; blood, cardiovascular system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation recommended.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 2* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or foam extinguishers. *Do not use water.* Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: *N*-Isopropylaniline, Trenton, NJ (October 2006).

Isopropyl Chloroformate I:0490

Formula: $C_4H_7ClO_2$: $(CH_3)_2CHOOCCl$

Synonyms: Carbonochloride acid 1-methyl ester; Carbonochloridic acid, 1-methylethyl ester; Chloroformic acid isopropyl ester; Cloruro de isopropilo (Spanish); Isopropyl chlorocarbonate; Isopropyl chloromethanoate

CAS Registry Number: 108-23-6

HSDB Number: 2848

RTECS Number: LQ6475000

UN/NA & ERG Number: (PIH) UN2407/155

EC Number: 203-563-2

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 15,000 (≥1.00% concentration).

Hazard Alert: Poison inhalation hazard, Highly flammable liquid, Primary irritant (w/o allergic reaction).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg)

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazard symbols, risk, & safety statements: Hazard symbol: T + , F, C; risk phrases: R11; R14/15; R20/22; R26; R29; R34; R36/37/38; R41; R48/20/23; R51; R63; R65; R67; safety phrases: S1; S8; S16; S26; S28; 36/37/39; S41; S45; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Isopropyl chloroformate is a highly flammable, clear, colorless liquid. Pungent odor. Molecular weight = 122.56; specific gravity (H_2O:1) = 1.08 @ 20°C; boiling point = 105 °C; freezing/melting point = −80°C; vapor pressure = 72 mmHg @ 21°C; flash point = 28°C (oc); Autoignition temperature ≥ 500°C. Explosive limits: LEL = 4%; UEL: 15%. Insoluble in water; decomposition forming hydrogen chloride.

Potential Exposure: Isopropyl chloroformate is used as an intermediate for free-radical polymerization initiators and in organic synthesis.

Incompatibilities: Vapor may form explosive mixture with air. Decomposes slowly in cold water and above 20°C forming hydrogen chloride. Store under refrigeration. Contact with iron salts may cause explosive thermal decomposition. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, metal salts; amines, alcohols, ethers.

PELs in Air

PAC* Ver. 29[138]

PAC-1: 0.3 ppm

PAC-2: $\mathbf{3.3_A}$ ppm

PAC-3: $\mathbf{10_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values. Russia: STEL 0.1 milligram per cubic meter, 1993; United Kingdom TWA1 ppm (5.1 milligram per cubic meter), 2000; Netherlands: MAC-TGG 5 milligram per cubic meter, 2003

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short-Term Exposure: A phosgene derivative. Inhalation exposures at elevated concentrations cause death by immediate lung damage; lower concentrations cause difficult breathing; collapse, and convulsions. Can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Inhalation of material may cause death or permanent injury. Eye irritations, irritation of upper respiratory tract and surface burns have been observed. Eye irritation may persist after exposure ceases, and skin sensitization may occur. Ingestion can be fatal.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in refrigeration, below 20°C. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, iron salts; acids, alkalis, amines, alcohols. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2407 Isopropyl chloroformate, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, 8-Corrosive material, Inhalation Hazard Zone B

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (*From a small package or a small leak from a large package*)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (*From a large package or from many small packages*)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.6/1.0

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

In case of spills or leaks, shut off ignition sources and keep away flares, smoke or flames. Do not touch spilled material. Use water to reduce vapors but do not get water inside containers. Take up *small spills* with sand or other noncombustible absorbent material and place in containers for later disposal. For *large spills*, dike far ahead of spill for later disposal.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. For small fires, use dry chemical, carbon dioxide; water spray or foam. For large fires, use water spray, fog or foam. Stay upwind and keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Vapor explosion hazard indoors, outdoors or in sewers. Runoff to sewer may create fire or explosion hazard. *See above for isolation distances*. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside container. Cool containers exposed to flame with water until well after fire is out. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States Environmental Protection Agency, Chemical Hazard Information Profile: Isopropyl Chloroformate, Washington, DC, Chemical Emergency Preparedness Program (June 2002).

Isopropyl Formate I:0500

Formula: $C_4H_8O_2$: $HCOOCH(CH_3)_2$

Synonyms: Formic acid, isopropyl ester; Isopropyl methanoate

CAS Registry Number: 625-55-8

HSDB Number: 6401

RTECS Number: LQ8750000

UN/NA & ERG Number: UN1281/129

EC Number: 210-901-2 [*Annex I Index No.*: 607-016-00-2]

Regulatory Authority and Advisory Information

Hazard Alert: High acute toxicity, Highly flammable liquid, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, Xi; risk phrases: R11; R36/37/38; R67; R51; R67; safety phrases: S2; S9; S16; S21; S24; S33; S36; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Isopropyl formate is a clear liquid with a pleasant odor. Molecular weight = 88.11; boiling point = 67°C; flash point = −6°C (cc) ; autoignition temperature = 485°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 1. Slow decomposition in water.

Potential Exposure: Used as a fumigant and in organic synthesis.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

PELs in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation of vapor can cause irritation of eyes and nose. High concentrations can cause drowsiness leading to unconsciousness in a few minutes; death within a few hours. Contact with liquid formic acid, isopropyl ester can cause irritation of eyes and skin. Eye irritation can be serious. Ingestion can result in irritation of the mouth and stomach, with loss of consciousness and possible death occurring if untreated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1281 Propyl formates, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Move container from fire area if you can do it without risk. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Isopropyl Glycidyl Ether I:0510

Formula: $C_6H_{12}O_2$: CH_2-(O)-CH-CH_2-O-$CH(CH_3)_2$

Synonyms: 1,2-Epoxy-3-isopropoxypropane; Glycidyl isopropyl ether; IGE; Isopropil glicidil eter (Spanish); Isopropyl epoxypropyl ether; (Isoproxymethyl)oxirane; NCI-C56439; Oxyde de 2,3-epoxypropyle et d'isopropyle (French)

CAS Registry Number: 4016-14-2

HSDB Number: 4302

RTECS Number: TZ3500000

EC Number: 223-672-9

UN/NA & ERG Number: UN3271/127; UN1993 (flammable liquids, n.o.s.)/128

EC Number: 223-672-9

Regulatory Authority and Advisory Information

Carcinogenicity: DFG Carcinogen Category 3 (suspected)

Hazard Alert: Highly Flammable, Reproductive toxin: possible risk of gene damage/impaired fertility; possible polymerization hazard (glycol ethers), Primary irritant (w/o allergic reaction); Sensitization hazard.

CLEAN AIR ACT: Hazardous Air Pollutants (Title I, Part A, Section 112) as glycol ethers.

EPCRA Section 313: Form R *de minimis* concentration reporting level: 1.0% as glycol ethers.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R19; R36/37/38; R42/43; R62; safety phrases: S2; S16; S26; S36/37/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)].

as glycol ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono-and di-ethers of ethylene glycol, diethyl glycol; and triethylene glycol R-$(OCH_2CH_2)_n$-OR′ where $n = 1, 2$, or 3; R = alkyl or aryl groups; R′ = R, H, or groups which, when removed, yield glycol ethers with the structure: R-$(OCH_2CH)_n$-OH. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. R-$(OCH_2CH_2)_n$-OR′; where $n = 1, 2$, or 3; R = alkyl C7 or less; or R = phenyl or alkyl substituted phenyl; R′ + H, or alkyl C7 or less; or OR′ consisting of carboxylic ester, sulfate, phosphate, nitrate or sulfonate. Form R de minimis concentration reporting level: 1.0%.

Description: Isopropyl glycidyl ether is a flammable colorless liquid. Molecular weight = 116.18; specific gravity (H_2O:1) = 0.92 @ 20°C; boiling point = 127.2°C; vapor pressure = 9.4 mmHg @ 25°C; flash point = 33.3°C. Highly soluble in water; solubility = ≥100 mg/L @ 19°C.

Potential Exposure: Making various products including epoxy resins, organic compounds, ethers and esters.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Ethers may act as bases; they form salts with strong acids and addition complexes with Lewis acids. When heated or in contact with catalysts, epoxides may cause violent polymerization. Epoxides are incompatible with reducing agents and oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May react, possibly violently, with water in the presence of acid and other catalysts. Reacts with alcohols, amines and other active hydrogen compounds. Slowly hydrolyzes in water. Ethers can form unstable and explosive peroxides upon standing. Reacts violently with strong oxidizers. Ethers can act as bases. They form salts with strong acids and addition complexes with Lewis acids. The complex between diethyl ether and boron trifluoride is an example. Ethers may react violently with strong oxidizing agents. In other reactions, which typically involve the breaking of the carbon-oxygen bond, ethers are relatively inert[101].

PELs in Air

NIOSH IDLH = 400 ppm

Conversion factor: 1 ppm = 4.75 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 50 ppm/240 milligram per cubic meter TWA

NIOSH REL: 50 ppm/240 milligram per cubic meter [15-min] Ceiling Concentration

ACGIH TLV[1]: 50 ppm/238 milligram per cubic meter TWA; 75 ppm/356 milligram per cubic meter STEL

PAC not available

DFG MAK: Carcinogen Category 3B

Australia: TWA 50 ppm (240 milligram per cubic meter); STEL 75 ppm, 1993; Austria: Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (238 milligram per cubic meter); STEL 75 ppm (356 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (240 milligram per cubic meter), 1999; Finland: STEL 50 ppm (240 milligram per cubic meter), 1999; France: VME 50 ppm (240 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 0.5 milligram per cubic meter, 2003; Switzerland: MAK-W 50 ppm (240 milligram per cubic meter), KZG-W 100 ppm (480 milligram per cubic meter), 1999; Turkey: TWA 30 ppm (240 milligram per cubic meter), 1993; United Kingdom: TWA 50 ppm (241 milligram per cubic meter); STEL 75 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 75 ppm. Several states have set guidelines or standards for IGE in ambient air[60] ranging from 2.4 milligram per cubic meter (Connecticut) to 2.4−3.6 milligram per cubic meter (North Dakota) to 4.0 milligram per cubic meter (Virginia) to 5.714 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH (IV), Method #1620, Isopropyl glycidyl ether; OSHA Analytical Method 7.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 0.5$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; dermal contact; absorbed through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the central nervous system; causing headache, dizziness, and loss of consciousness.

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization. Lungs may be affected by inhalation of high concentrations of the vapor, and may cause bronchitis. Possible hematopoietic effects.

Points of Attack: Eyes, skin, respiratory system; blood, reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. CBC. Pulmonary function tests. Evaluation by a dermatologist or by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in an explosion-proof refrigerator. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3271 Ethers, n.o.s., Hazard class: 3; Labels: 3-Flammable liquid, Technical Name Required. UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides-discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides-perforation of a container of the waste from a safe distance followed by open burning.

Isoxaflutole I:0560

Formula: $C_{15}H_{12}F_3NO_4S$

Synonyms: Balance PRO; Balance WDG; 5-Cyclopropylisoxazol-4-yl 2-mesyl-4-trifluoromethylphenyl ketone; 5-Cyclopropyl-4-isoxazolyl)[2-(methylsulfonyl)-4-(trifluoromethyl)phenyl]-methanone; 5-Cyclopropyl-4-(2-methanesulfonyl-4-trifluoromethylbenzoyl)isoxazole; 5-Cyclode minimispropyl-4-(2-methylsulfonyl-4-trifluoromethylbenzoyl) isoxazole; 5-Cyclopropyl-1,2-oxazol-4-yl α,α,α-trifluoro-2-mesyl-*p*-tolyl ketone; Epic (flufenacet + isoxaflutole); 264-EUP-99; **Isoxaflutole**; 4-(2-Methylsulfonyl-4-trifluoromethylbenzoyl)-5-cyclopropylisoxazole; RPA 201772

CAS Number: 141112-29-0

HSDB Number: 7275

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: [*Annex I Index No*.: 606-054-00-7]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Likely to be carcinogenic to humans; suspected developmental toxin California Proposition 65 Chemical[102]: Carcinogen (12/22/2000)

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Suspected reprotoxic hazard; Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R50/53; R63; safety phrases: S2; S29; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Yellow to tan/beige granular solid. Slight acetic acid odor for technical grade; the end-use material is odorless. Molecular weight = 359.32; specific gravity (H_2O:1) = 1.10; boiling point = (decomposes); freezing/melting point = 138–140°C; flash point = < 150°C. Low solubility in water; ~5 mg/L @20°C.

Potential Exposure: Cyclopropylisoxazole is a preemergent herbicide used on maize and field cotton. A United States Environmental Protection Agency RUP.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. SafeDrinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg [F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 2.5$. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH-or CEN (UK)-approved air purifying respirators for pesticides. May be harmful if swallowed. LD_{50} (oral, rat) $= > 2$ g/kg; also >5 g/kg.; LD_{50} (dermal, rat) $= > 2$ g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. This chemical is a probable carcinogen and it may be a reproduction hazard.

Points of Attack: Reproductive cells. May cause reproductive and fetal effects.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Wear positive pressure SCBA (SCBA). Wear chemical protective clothing that is specifically recommended by the manufacturer. DuPont Tychem Suit Fabrics is recommended by one government source[88]. It may provide little or no thermal protection. Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location and refrigerate 2 to 8°C. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Small spills and leakage: should a spill occur while you are handling this chemical, first remove all sources of ignition, then you should dampen the solid spill material with 60−70% ethanol and transfer the dampened material to a suitable container. Use absorbent paper dampened with 60−70% ethanol to pick up any remaining material. Seal the absorbent paper, and any of your clothes, which may be contaminated, in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the safety officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: Decomposes in temperatures >200°C. Thermal decomposition products may include hydrogen fluoride and oxides of nitrogen, sulfur, and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam*. *On a large fire*: use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC (as jet fuel): Animal Limited Evidence, Group 3, 1989.

Hazard Alert: Flammable, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), (petroleum, hydrotreated), Possible risk of forming tumors, FDA-over the counter drug (8008-20-6).

United States Environmental Protection Agency, FIFRA 1998 Status of Pesticides: Canceled (8008-20-6)

Hazardous to aquatic life or environment, with possible long lasting effects[293]. Toxic to aquatic life with long lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R51; R61; R62; R65; safety phrases: S2; S23; S24; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)]

Description: Kerosene is a pale yellow or clear, mobile liquid, composed of a mixture of petroleum distillates, having a characteristic odor. The odor threshold is 0.6 milligram per cubic meter. The taste threshold is 0.1 mg/L in water[59]. A refined petroleum solvent (predominantly C9−C16), which typically is 25% normal paraffins, 11% branched paraffins, 30% monocycloparaffins, 12% dicycloparaffins, 1% tricycloparaffins, 16% mononuclear aromatics, and 5% dinuclear aromatics. Molecular weight = 170 (approximately); specific gravity (H_2O:1) = 0.81; boiling point = 175−325°C; freezing/melting point = −23°C; vapor pressure = 5 mmHg @ 37.8°C; flash point = 35−72°C; autoignition temperature = 210−220°C. Explosive limits: LEL = 0.7%; UEL: 5.0%[17]. Hazard Identification (based on NFPA-704 M Rating System): Health 2; flammability 2; reactivity 0. Insoluble in water.

Potential Exposure: Kerosene is used as a fuel for lamps, stoves, jets, and rockets. It is also used for degreasing and cleaning metals and as a vehicle for insecticides. Jet fuels JP-5 and JP-8 are used as aircraft fuels by the military. JP-8 is the primary jet fuel used by the United States Navy and Air Force. Kerosene is the primary component of both JP-5 and JP-8.

Incompatibilities: Kerosene vapors may form explosive mixture in air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, nitric acid, strong bases. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: None, but both OSHA and the Air Force Office of Safety and Health have set an exposure limit of 400 milligram per cubic meter of petroleum product for an 8-hour work-day, 40-hour work-week.

NIOSH REL: 100 milligram per cubic meter TWA

ACGIH TLV[1]: 200 milligram per cubic meter TWA [skin] avoid prolonged and repeated skin contact; may be associated with an increase in skin cancer.

70892-10-3, Protective Action Criteria (PAC)* Ver. 29[138]

PAC-1: **290**$_{\mathbf{A}}$ milligram per cubic meter

PAC-2: **1100**$_{\mathbf{A}}$ milligram per cubic meter

PAC-3: 4800 milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Poland: MAC (TWA) 100 milligram per cubic meter, MAC (STEL) 300 milligram per cubic meter, 1999; Russia[43] set a MAC in work-place air of 300 milligram per cubic meter.

Determination in Air: Use NIOSH Analytical Method (IV) #1550, Naphthas.

Permissible Concentration in Water: MAC concentrations in water bodies used for domestic purposes ranging from 0.10 mg/L have been set by Russia[43]. New Jersey[59] has declined to set a maximum contaminant level for kerosene in water because of its variable composition.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Slightly irritates the skin and respiratory tract. *Inhalation:* Does not evaporate fast enough to cause health effects except when heated or in enclosed spaces. Headache, tiredness, stupor, dizziness, nausea, coma and death, may occur with increasing exposure. *Skin:* If not promptly removed, may cause reddening, blisters, itching and an increased risk of infection. *Eyes:* Irritation may occur. *Ingestion:* Accidental ingestion of unknown amounts has caused irritation of mouth, throat and stomach; nausea, vomiting, rapid breathing; Blue skin coloration; and convulsions. Death may result from as little as 1-fluid ounce. Inhalation into lungs following ingestion may result in bronchitis, chemical pneumonia; accumulation of fluid and blood in lungs, and death. As little as 1/30 oz may be

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00010-7

fatal in this way. LD_{50} = (oral-rat) >500 mg/kg. LD_{50} = 5 to 15 g/kg[85].

Long-Term Exposure: Repeated or prolonged skin contact may cause defatting, itching, and rash. Absorption through skin is slow but repeated skin contact over many years has caused muscular weakness, anemia, changes in white blood cells; fever and death. Can irritate the lungs; bronchitis may develop. May cause kidney damage. A study on the use of kerosene stoves found an increase in oral cancer in humans who used kerosene stoves. Skin tumors were seen in mice when their skin was exposed to jet fuel JP-5 for 60 weeks.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposure, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure, kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. **8 hours**: nitrile rubber and nitrile latex gloves, suits, boots; polyethylene gloves, suits, boots; Viton gloves, suits. **4 hours**: Neoprene rubber gloves, suits, boots; polyvinyl alcohol gloves; polyvinyl chloride gloves, suits, boots; Barricade coated suits; Responder suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol, nitrile, and nitrile + PVC are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1000 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *2500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *5000 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin- style, front-or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:PD, PP (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self- contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1223 Kerosene, Hazard Class: 3; Labels: 3-Flammable liquid. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive

limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include toxic oxides of carbon and irritating gases. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Spray into furnace after mixing with a more flammable solvent.

RTECS Number: OA7700000

UN/NA & ERG Number: UN1955/123 (P)[101] *Note*: Ketene is rarely stored or transported. UN2521(Diketene, stabilized)/131 *Note*: Obtained from the dimerization of ketene and can be stored and transported under refrigeration.

EC Number: 207-336-9

Regulatory Authority and Advisory Information

Hazard Alert: Exposure can be lethal, Extremely flammable gas, Severe lacrimator, Inhalation hazard (can be lethal), Explosive, Chemically unstable, Polymerization hazard (spontaneous, nonstabilized), Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated, Violently water reactive

Hazard symbols, risk, & safety statements: Hazard symbol: T + ; risk phrases: R5; R12; R14; R19; R21; R27/28; R50/53; safety phrases: S9; S13; S28; S33; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Ketene is an extremely flammable, highly reactive colorless gas. Prepared as needed from diketene*. Sharp, disagreeable, penetrating odor. Molecular weight = 42.04; boiling point = −49.8°C; −56.1°C[101]; freezing/melting point = −148−151°C; relative vapor density (air = 1): 1.45; vapor pressure = 750 mmHg @ −50°C. Explosive limits: LEL = 7000 ppm; UEL[138]: unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 4; flammability 2; reactivity 3₩. Reacts violently with water.

*Diketene (CAS: 674-82-8); Formula: ($C_4H_2O_2$) is a colorless liquid. Pungent odor. Depolymerizes at 650°C to give ketene[101]. Molecular weight = 84.08; density = 1.08 g/cm^3. Boiling point = 127°C. Freezing/melting point = −6.5°C; flash point = 33.9°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4; flammability 2; reactivity 2₩. Slightly soluble in water; reacts violently. *Note*: Obtained from the dimerization of ketene and can be stored and transported under refrigeration.

Potential Exposure: Ketene is used to synthesize various organic compounds; as an acetylating agent in cellulose acetate and aspirin manufacture; it is used in the conversion of higher acids to their anhydrides; in the production of spices, acetic anhydride, diethylamino gestrinone; ethyl acetate; ethyl acetoacetate; sorbic acid; vitamin A.

Incompatibilities: Diketene is chemically unstable except at very low temperatures; mixtures with air are explosive above 33°C. Reacts violently with water forming acetic acid. Diketene undergoes a further exothermic polymerization unless stabilized or retarded by storage in the solid state (below −6.5°C). This polymerization becomes violent (with risk of fire or explosion) with warming or on contact with acids or bases[101]. Ketene readily and spontaneously polymerizes. Decomposes in water, alcohol, and ammonia. Contact with hydrogen peroxide forms explosive diacetyl peroxide. Reacts violently with reducing agents; oxidizers, and many organic compounds. Soluble in diethyl ether and acetone. Can dimerize to diketene even at very low temperatures. Ketene is extremely flammable. It readily and spontaneously polymerizes; *it cannot be stored or shipped* and is obtained instead *as needed* from diketene. It is only partially stable at low temperatures (−80°C). It always has to be freshly prepared and processed immediately. Decomposes in water, alcohol, and ammonia. Reacts violently with water to form acetic acid. Contact with hydrogen peroxide forms explosive diacetyl peroxide. Reacts violently with reducing agents; oxidizers, alcohols, ammonia, and many organic compounds. Can dimerize to diketene even at very low temperatures[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 5 ppm

Conversion factor: 1 ppm = 1.72 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.5 ppm/0.9 milligram per cubic meter TWA

NIOSH REL: 0.5 ppm/0.9 milligram per cubic meter TWA; 1.5 ppm/3 milligram per cubic meter STEL

ACGIH TLV[1]: 0.5 ppm/0.86 milligram per cubic meter TWA; 1.5 ppm/2.6 milligram per cubic meter STEL

PAC Ver. 29[138]

Ketene

PAC-1: 0.0057 ppm

PAC-2: $\mathbf{0.063_A}$ ppm

PAC-3: $\mathbf{0.19_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

Arab Republic of Egypt: TWA 0.5 ppm (0.9 milligram per cubic meter), 1993; Australia: TWA 0.5 ppm (0.9 milligram per cubic meter); STEL 1.5 ppm, 1993; Austria: MAK 0.5 ppm (0.9 milligram per cubic meter), 1999; Belgium: TWA 0.5 ppm (0.89 milligram per cubic meter); STEL 1.5 ppm, 1993; Denmark: TWA 0.5 ppm (0.9 milligram per cubic meter), 1999; Finland: STEL 0.5 ppm (0.9 milligram per cubic meter), 1999; France: VME 0.5 ppm (0.9 milligram per cubic meter), 1999; the Netherlands: MAC−TGG 0.9 milligram per cubic meter, 2003; Norway: TWA 0.5 ppm, 1999; the Philippines: TWA 0.5 ppm (0.9 milligram per cubic meter), 1999; Poland: MAC (TWA) 0.5 milligram per cubic meter, MAC (STEL) 1.5 milligram per cubic meter, 1999; Switzerland: MAK-W 0.5 ppm (0.9 milligram per cubic meter), KZG-W 1 ppm (1.8 milligram per cubic meter), 1999; Turkey: TWA 0.5 ppm (0.9 milligram per cubic meter), 1993; United Kingdom: TWA 0.5 ppm (0.87 milligram per cubic meter); STEL 0.5 ppm (2.6 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 1.5 ppm; Several states have set guidelines or standards for ketene in ambient air[60] ranging from 3.3 μ/m^3 (New York) to 4.5 μ/m^3 (South Carolina) to 9.0 μ/m^3 (Florida) to 9.0−30.0 μ/m^3 (North Dakota) to 18.0 μ/m^3 (Connecticut) to 21.0 μ/m^3 (Nevada) to 25.0 μ/m^3 (Virginia).

674-82-8, Diketene (ketene dimer)

PAC-1: 0.091 ppm

PAC-2: $\mathbf{1.0_A}$ ppm

PAC-3: $\mathbf{3.0_A}$ ppm

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minutes values.

Determination in Air: Use NIOSH (II-2)[2], Method #S92.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Poison gases. Ketene and Diketene (ketene dimer) can affect you when breathed in. Breathing the vapor can irritate the lungs, causing coughing, chest pain; and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Repeated or high exposure may cause permanent lung damage. Exposure can irritate the eyes, nose, and throat.

Long-Term Exposure: Repeated or prolonged exposure may cause permanent lung damage, resulting in emphysema and fibrosis. Prolonged skin contact may cause skin rash.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; white blood cell count/differential. If symptoms develop or overexposure in suspected, the following may be useful: consider chest X-ray after acute overexposure, or to rule out scarring in persons with a history of suspected repeated overexposures.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 5 ppm:* Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-, or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Poison inhalation chemical; check oxygen content prior to entering storage area. Ketene readily polymerizes and cannot be shipped or stored. Is generated and processed instead as needed at the point of use from diketene. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic and chemically unstable. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in well-ventilated areas in temperatures not to exceed 50°C. Ketene cannot be stored. Ketene must be kept away from water and a wide variety of organic compounds, since violent reactions occur. Ketene must be kept in tightly closed containers in a cool, well-ventilated area away from heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1955 ***Ketene*** *is not shipped as a rule, but is usually generated as needed from diketene at the point of use in a chemical process by acetone pyrolysis. It polymerizes readily and hence immediate use is highly preferred.* Compressed gas, toxic, n.o.s. Inhalation Hazard Zone A, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, Technical Name Required, Inhalation Hazard Zone A. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner. UN2521 **Diketene, stabilized**, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances: ***Ketene***

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 1.4/2.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 2000/610
Then: Protect persons downwind (mi/km)
Day 2.2/3.6
Night 5.9/9.5

Initial isolation and protective action distances: ***Diketene, stabilized***

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase

with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.3/0.5
Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Restrict persons not wearing protective equipment from area of leak until clean-up is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. *Do not use water* because it reacts violently with ketene. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: *See Initial isolation and protective action distances above*. These chemicals are chemically unstable. Thermal decomposition products may include oxides of carbon. *Highly flammable*: Will be easily ignited by heat, sparks, or flames. Vapors may form explosive mixture with air. Vapors may travel to source of ignition and flashback. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapor explosion and poison hazard indoors, outdoors or in sewers. Those substances designated with a (P) may polymerize explosively when heated or involved in a fire. Runoff to sewer may create fire or explosion hazard. Containers may explode when heated. Many liquids are lighter than water. *Caution*: All these products have a very low flash point: Use of water spray when fighting fire may be inefficient. *Small fire*: Dry chemical, CO_2, water spray, or alcohol-resistant foam. *Large fire*: Water spray, fog, or alcohol-resistant foam. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. Use water spray or fog; do not use straight streams. *Fire involving tanks or car/trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. *Always* stay away from tanks engulfed in fire. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn (ERG, 2012). Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Use a licensed professional waste disposal service to dispose of this material. All federal, state, and local environmental regulations must be observed.

Kinetin K:0120

Formula: $C_{10}H_9N_5O$
Synonyms: Adenine, *N*-furfuryl-; Adenine, N^6-furfuryl-; Cytokinin; Cytokinin, as kinetin, based on biological activity; Cytokinins (with Cytokinin B, Cytokinin R); Cytokinins (derived from aqueous extract of seaweed); FAP; Foliar trigger; Foli-zyme; N^6-(Furfurylamino)purine; 6-(Furfurylamino) purine; N^6-Furfuryladenine; 2-Furanmethanamine, *N*-1*H*-purin-6-yl-; *N*-(2-Furanylmethyl)-1*H*-purin-6-amine; 6-Furfurylaminopurine; Goldengro; Happygro; Maxon; Megagro; Mepex; Nitrozyme; 1-*H*-Purin-6-amine, *N*-(2-furanylmethyl)-
CAS Number: 525-79-1
HSDB Number: 7429
RTECS Number: AU6270000

UN/NA & ERG Number: UN3462/153

EC Number: 208-382-2

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Suspected reprotoxic hazard

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R68; R36/37/38; R50/53; R61; safety phrases: S2; S22; S23; S24/25; S26; S27 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: White crystalline solid. Commercial formulations may be liquid concentrates. Molecular weight = 215.22; freezing/melting point = 265°C; Henry's Law constant = 1.2×10^{-14} atm-m^3/mole @ 25°C (est)[83]; vapor pressure = 1.8×10^{-8} mmHg @ 25°C[83]. Slightly soluble in water; solubility = 358 mg/L @ 25°C[83].

Potential Exposure: Cytokinin is a group of botanical plant growth regulators used to promote cell division, leaf expansion and retard leaf aging. Cytokinin is derived from aqueous extract of seaweed meal. The extracts from these plant species (e.g., the naturally occurring cytokinins) are exempt from the requirements of tolerances when used as plant regulators in or on many raw agricultural commodities (40 CFR 180.1042). Cytokinin is applied to growing crops (field crops, vegetable crops, small fruits, vines, and tree fruit), young trees, ornamental, to increase fruit size, yield, blossoms, branching, healthy appearance, and other desirable growth effects. Also used on golf courses.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Determination in Water: Octanol−water coefficient: $\log K_{ow} = 0.6$ (est)[83]. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved air-purifying respirators for pesticides. May be harmful if swallowed.

Long-Term Exposure: May cause reproductive and fetal effects.

Points of Attack: Reproductive cells.

Medical Surveillance: In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genito-urinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone, and serum lutenizing hormone, may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3462 Toxins, extracted from living sources, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Ventilate area of spill or leak. Use water spray to reduce vapor. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol-resistant foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

L

Lactofen L:0050

Formula: $C_{19}H_{15}ClF_3NO_7$

Synonyms: Benzoic acid, 5-[2-chloro-4-(trifluoromethyl)phenoxy]-2-nitro-2-ethoxy-1-methyl-2-oxoethyl ester; 1-(Carboethoxy)ethyl-5-[2-chloro-4-(trifluoromethyl)phenoxy]-2-nitrobenzoate; 5-[2-Chloro-4-(trifluoromethyl)phenoxy]-2-nitrobenzoic acid 2-ethoxy-1-methyl-2-oxoethyl ester; Cobra; (±)-2-Ethoxy-1-methyl-2-oxoethyl-5-[2-chloro-4-(trifluoromethyl)phenoxy]-2-nitrobenzoate; Ethyl *O*-[5-(2-chloro-α,α,α-trifluoro-*p*-tolyloxy)-2-nitrobenzoyl]-*dl*-lactate; PPG-844; Steller; V-10086

CAS Registry Number: 77501-63-4; (81362-49-4 obsolete); 62476-59-9 (lactofen-sodium, degradation product)

HSDB Number: 6991; 6551 (lactofen-sodium)

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

RTECS Number: DG5643120

EC Number: Not assigned

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Likely to be carcinogenic to humans in high doses; unlikely to be a carcinogen at low doses.

California Proposition 65 Chemical[102]: Carcinogen (1/1/1989)

Hazard Alert: Poison, Agricultural chemical. Listed for Tier 1 screening as an endocrine disruptor[88].

EPA acceptable daily intake (ADI) = 0.0015 mg/kg/day; EPA Oral reference dose (RfD) = 0.002 mg/kg/day

Safe Drinking Water Act (47FR 9352): Priority List (55 FR 1470)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazard symbols, risk, & safety statements: Hazard symbol: N, Xn; risk phrases: R21; R51/53; safety phrases: S29; S36/37; S61; S41 (see Appendix 4)

Description: Tan to dark brown solid. Technical product is a white crystalline solid. Commercial product may also be available as an emulsifiable concentrate. Molecular weight = 461.79; specific gravity (H_2O:1) = 1.39; freezing/melting point = 43.9–45.5°C; vapor pressure = 7.9×10^{-9} mmHg @ 20°C. Practically insoluble in water.

Potential Exposure: Lactofen is a diphenyl ether, broad-spectrum herbicide used both for preemergence and post-emergent weed control on peanuts, snap beans, soybeans, cotton, and fruiting vegetables. Not registered for use in residential settings.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: High Performance Liquid Chromatography. Octanol-water coefficient: Log K_{ow} = >4. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: High−1.97989 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Eyes, dermal contact, ingestion. May be absorbed through unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: This material can cause corrosive burns to the skin and eyes. *Ingestion*: Slight irritation. Mildly toxic via all routes of exposure. LD_{50} (oral, rat) = >5 g/kg.; LD_{50} (dermal, rat) = >2 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. May cause permanent eye damage. May be mutagenic. Human toxicity (long term)[101]: High−2.05882 ppb, CHCL (Chronic Human Carcinogen Level).

Points of Attack: Liver and kidneys, eyes and skin.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system (CNS), liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen (in high doses). Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Diphenyl ether derivatives may react with the following absorbent materials: Expanded Polymeric[88]. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00011-9

DuPont Tychem suit fabrics[88]. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any (NIOSH)/MSHA or European Standard EN 149-approved self-contained breathing apparatus (SCBA) that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: 100 F (APF = 50) (any air purifying, full facepiece respirator with N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Corrosive and poisonous. Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Store in tightly closed containers in a cool, well-ventilated area. Color code-Blue: Health Hazard/Poison; Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, heat, and incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. If this material may contain a flammable carrier, sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquid containing this chemical in vermiculite, dry sand, earth, or similar material. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include toxic hydrogen chloride (HCl) and hydrogen fluoride gas and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Fire involving storage or vehicular tanks: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. On a small fire: use dry chemical, CO_2, water spray or regular foam. On a large fire: use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. Fire involving tanks: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult and follow all regional, national, state, and local hazardous waste laws to ensure complete and accurate classification and disposal methods.

Lactonitrile L:0055

Formula: C_3H_5NO; $CH_3CHOHCN$

Synonyms: Acetaldehyde cyanohydrin; 2-Hydroxypropionitrile; Lactonitrilo (Spanish); NSC 7764; Propionitrile, 2-hydroxy-

CAS Registry Number: 78-97-7

HSDB Number: 5225

RTECS Number: OD8225000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3276 (Nitriles, toxic, liquid, n.o.s.)/151

EC Number: 201-163-2

Regulatory Authority and Advisory Information

Hazard Alert: Exposure can be lethal, Extremely toxic, Flammable.

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 1000 lb (454 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R10; R20; R23/24/25; R27; R36/37/38; R42; R50; safety phrases: S13; S22; S23; S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)]

Description: Lactonitrile is a colorless to straw-colored liquid. Molecular weight = 71.09; specific gravity (H_2O:1) = 0.98 @ 20°C; boiling point = 183°C (slight decomposition); 221°C[138]; freezing/melting point = −40°C; vapor pressure = 0.119 mmHg @ 25°C; flash point = 77°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: This material is used as a solvent and as an intermediate in the production of ethyl lactate and lactic acid.

Incompatibilities: Alkalis form hydrogen cyanide. Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Permissible Exposure Limits in Air

NIOSH REL: Nitriles: 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

Protective Action Criteria (PAC) Ver. 29[138]

PAC-1: 0.24 milligram per cubic meter

PAC-2: 2.6 milligram per cubic meter

PAC-3: 16 milligram per cubic meter

Determination in Air: See NIOSH Criteria Document 78-212 *Nitriles*[18]

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Extremely toxic by oral, skin, or eye contact[72]. Signs and symptoms of acute exposure to lactonitrile may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry-red mucous membranes and blood, cardiac arrhythmias; and other cardiac abnormalities are common. Cyanosis (blue tint to the skin and mucous membranes) may be present, following exposure to lactonitrile. Salivation, nausea, and vomiting may also occur. Tachypnea (rapid respiratory rate) may be followed by respiratory depression. Lung hemorrhage and pulmonary edema may occur. Headache, vertigo (dizziness), agitation, and giddiness may be followed by combative behavior, convulsions, paralysis, protruding eyeballs; dilated and unreactive pupils, and coma. Lactonitrile is irritating to the skin and mucous membranes. Lacrimation (tearing) and a burning sensation of the mouth and throat are common. Warning: Heart palpitations may occur within minutes after exposure. Caution is advised. Vital signs should be monitored closely. Symptoms may be delayed.

Long-Term Exposure: May cause liver and kidney damage. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Respiratory system; CNS; cardiovascular system, liver, kidneys.

Medical Surveillance: Liver function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. The NIOSH REL for nitriles is a Ceiling Concentration of 6 milligram per cubic meter, not to be exceeded in any 15-minute work period.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and alkalies. Store in a refrigerator under an inert atmosphere and protect from light for prolonged storage.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70].

Nitriles spill

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0% as inorganic compounds, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; risk phrases: R45; R20/22; R33; R36/38; R40; R48/20; R61; R62; Safety phrases: S26; S36/37; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Inorganic lead includes lead oxides, metallic lead, lead salts, and organic salts, such as lead soaps; but excludes lead arsenate and organic lead compounds. Lead is a blue-gray metal which is very soft and malleable. Lustrous when freshly cut; tarnishes in moist air. Specific gravity (H_2O:1) = 11.34; molecular weight = 207.19; boiling point = 1750°C; freezing/melting point = 327.5°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Metallic lead is used for lining tanks, piping, and other equipment where pliability and corrosion resistance are required, such as in the chemical industry in handling corrosive gases and liquids used in the manufacture of sulfuric acid; in petroleum refining; and in halogenation, sulfonation, extraction, and condensation processes; and in the building industry. It is also used as an ingredient in solder; a body filler in the automobile industry; and a shielding material for X-rays and atomic radiation; in manufacture of tetraethyl lead and organic and inorganic lead compounds; pigments for paints and varnishes; storage batteries; fling glass; vitreous enameling, ceramics as a glaze; litharge rubber, plastics, and electronic devices. Lead is utilized in metallurgy and may be added to bronze, brass, steel, and other alloys to improve their characteristics. It forms alloys with antimony, tin, copper, etc. It is also used in metallizing to provide protective coatings and as a heat treatment bath in wire drawing. Exposures to lead dust may occur during mining, smelting, refining, and to fume, during high temperature ($>$ 500°C) operations, such as welding or spray coating of metals with molten lead. There are numerous applications for lead compounds, some of the more common being in the plates of electric batteries and accumulators; as compounding agents in rubber manufacture; as ingredients in paints, glazes, enamels, glass, pigments; and in the chemical industry. In addition, to these usual levels of exposure from environmental media, there exist miscellaneous sources which are hazardous. The level of exposure resulting from contact is highly variable. Children with pica for paint chips or for soil may experience elevation in blood lead, ranging from marginal to sufficiently great to cause clinical illness. Certain adults may also be exposed to hazardous concentrations of lead in the work-place, notably in lead smelters and storage battery manufacturing plants. Again, the range of exposure is highly variable. Women in the work-place are more likely to experience adverse effects from lead exposure than men due to the fact that their hematopoietic system is more lead-sensitive than men. Because of health concerns, lead from gasoline, paints, and ceramic products; caulking, and pipe solder, has been dramatically reduced in recent years.

Incompatibilities: Lead dust is flammable in air and may explode when exposed to heat or flame. Reacts with sulfuric acid, hot concentrated nitric acid; boiling concentrated hydrochloric acid. Powdered lead can react (possibly violently) with strong oxidizers, ammonium nitrate; chlorine trifluoride; chemically active metals; concentrated hydrogen peroxide; sodium acetylide. Incompatible with sodium azide, disodium acetylide; hydrogen peroxide; active metals-sodium, potassium, zirconium. Lead is attacked by pure water and weak organic acids in the presence of oxygen. Attacked at room temperature by chlorine, fluorine.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hour. In any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C.

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

Metallic Lead:

PAC-1: 0.15 milligram per cubic meter

PAC-2: 120 milligram per cubic meter

PAC-3: 700 milligram per cubic meter

National primary and secondary ambient air quality standards for lead and its compounds, 1.5 μ[Pb]/m^3, maximum arithmetic mean averaged over a calendar quarter [40 CFR 50.12, Appendix G].

European OEL: 0.15 mg[Pb]/m^3 TWA (2002)

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age $<$ 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Austria: MAK 0.1 milligram per cubic meter, 1999; Denmark: TWA 0.1 milligram per cubic meter, 1999; Japan 0.1 milligram per cubic meter, 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; Poland: MAC (TWA) 0.05 milligram per cubic meter, 1999; Sweden: TWA 0.05 milligram per cubic meter (resp. dust), 1999; Sweden:

TWA 0.1 milligram per cubic meter (total dust), 1999; the Netherlands: MAC-TGG 0.15 milligram per cubic meter, 2003. The EPA requires lead in air not to exceed 1.5 micrograms per cubic meter (1.5 μ/m^3) averaged over 3 months. The Czech Republic at 0.7 μ/m^3 on a daily average basis and @ 2.0 μ/m^3 on a momentary basis. Several states have set guidelines or standards for lead in ambient air[60] ranging from 0.068 μ/m^3 (Massachusetts) to 0.357−1.5 μ/m^3 (North Dakota and Pennsylvania) to 2.5 μ/m^3 (New York) to 3.0 μ/m^3 (Connecticut) to 4.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCLG = zero mg[Pb]/L; MCL = Action Level = 0.015 mg[Pb]/L. Lead is regulated by a TT that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level of 0.015 mg[Pb]/L, water systems must take additional steps. State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by inductively coupled plasma (ICP) optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Ingestion of dust; inhalation of dust or fume, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The effects of exposure to fumes and dusts of inorganic lead may be slow to develop. Extremely high exposures can lead to seizures, coma, and death, but symptoms occur after weeks to months of exposure. The earliest symptoms may include tiredness, decreased physical fitness; fatigue, sleep disturbance; headache, aching bones and muscles; constipation, abdominal pains and decreased appetite; and moodiness (mostly irritability and depression). Skin contact may cause irritation. Eyes contact may cause irritation. Ingestion of large amounts of lead may lead to seizures, coma, and death.

Long-Term Exposure: Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include high blood pressure, anemia, pale skin, a Blue line at the gum margin; paralysis of forearm, wrist joint, and fingers, causing decreased hand-grip strength; abdominal pain; severe constipation; nausea, vomiting. Prolonged exposure to high enough levels may result in serious, permanent kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, mood and personality changes; retarded mental development; convulsions, coma, delirium, and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead is a probable teratogen in humans. Continuous exposure can result in decreased fertility in males and females. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects. May cause retarded development of the newborn. *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs. The effects may be delayed. Medical observation is recommended. The biological half-life of lead (Pb) in the bones of humans = 10 years.

Points of Attack: Eyes, gastrointestinal (GI) tract; CNS; kidneys, blood, gingival tissue.

Medical Surveillance: OSHA mandated medical tests: whole blood (chemical/metabolite), blood lead level, hemoglobin, hematocrit, zinc protoporphyrin, blood urea nitrogen, serum creatinine; urinalysis (routine), microscopic examination. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, complete blood count (CBC), and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women $<$ 45 years old.

NIOSH lists the following tests: whole blood (chemical/metabolite); blood lead level; biologic tissue/biopsy; CBC; nerve conduction studies; neurologic examination/electromyography; red blood cells/count; red blood cells/count: zinc protoporphyrin; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), 24-hour collection; Zinc Protoporphyrin; Zinc Protoporphyrin, after 1-month exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. When this chemical has been swallowed, get medical attention.

Antidotes and Special Procedures: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This “chelating” drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. edetate disodium calcium (Ca EDTA) or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Note to Physician: For severe poisoning, British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$) (BAL) has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Prevent skin contact: Any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Vacuum clothing with HEPA. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH 78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (milligrams per cubic meter) (10 × PEL): Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL): Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL): (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL): Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting: Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm (micrometers) in diameter or higher.

Respirator Requirements of 1926.62 (Construction Lead Standard)

< or = 0.5 milligram per cubic meter: (1) Half-mask* air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in demand (negative pressure) mode. < or = 1.25 milligram per cubic meter: (1) Loose-fitting hood or helmet powered air-purifying respirator with high-efficiency filters**; or (2) Hood or helmet supplied-air respirator operated in a continuous-flow mode, e.g., Type CE abrasive blasting respirators operated in a continuous-flow mode). < or = 2.5 milligram per cubic meter: (1) Full-facepiece air-purifying respirator with high-efficiency filters**; (2) Tight-fitting powered air-purifying respirator with high-efficiency filters**; (3) Full-facepiece supplied-air respirator operated in demand mode; (4) Half-mask* or full-facepiece supplied-air respirator operated in a continuous-flow mode; or (5) Full-facepiece SCBA operated in demand mode. < or = 50 milligram per cubic meter: Half-mask* supplied-air respirator operated in pressure-demand or other positive-pressure mode. < or = 100 milligram per cubic meter: Full-facepiece supplied-air respirator operated in pressure- demand or other positive-pressure mode, e.g., Type CE abrasive blasting respirators operated in a continuous-flow mode). > 100 milligram per cubic meter, unknown concentration, or firefighting: Full-facepiece SCBA in pressure-demand or other positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter and higher.

Storage: (1) Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8—10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Lead is regulated by OSHA Standard 1910. 1025. All requirements of the standard must be followed.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Get all workers out of spill area. Put on necessary protective equipment including respirators. If spill is a solution, cover with absorbent and shovel into suitable container. If spill is in powder form, vacuum (HEPA) whenever possible to avoid raising dust by sweeping or blowing. Place in suitable container. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead powder is flammable when exposed to heat or flame. Thermal decomposition products may include metal oxides. Do not use water. Use dry chemicals appropriate for extinguishing metal fires. Generally the problem is to fight a fire based on the surrounding combustible material since metallic lead is not combustible. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recycle wherever possible. May be treated with HNO_3 to give lead nitrate; the lead may be precipitated as the sulfide, which is then sent to a lead recovery plant[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*301-04-2*): Hazard Symbol: T, N; Risk phrases: R61; R33; R48/22; R50/53; R62; R63; Safety phrases: S29; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead acetate is a white, flaky crystalline substance with a slight odor of acetic acid. Commercial grades may be powdered granules, or brown or gray lumps. *Diacetate*: Powder. Molecular weight = 325.29; specific gravity (H_2O:1) = 2.55 @ 20°C; boiling point = 280°C; freezing/melting point = 75°C (decomposes above 200°C). Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water, but absorbs carbon dioxide upon exposure to air, and may become insoluble in water. *Basic, subacetate*: Solid. Molecular weight = 807.7; freezing/melting point = 280°C; Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water, but absorbs carbon dioxide upon exposure to air, and may become insoluble in water. *Lead(II) acetate, trihydrate*: Molecular weight = 379.4; specific gravity (H_2O:1) = 2.55 @ 20°C; freezing/melting point = 74.5°C.

Potential Exposure: Lead acetate is used as a color additive in hair dyes; as a mordant in cotton dyes, in the lead coating of metals; as a drier in paints; varnishes and pigment inks; and in medicinals, such as astringents.

Incompatibilities: A strong reducing agent. Reacts violently with strong oxidizers, bromates, strong acids; chemically active metals; phosphates, carbonates, phenols. Contact with strong acids forms acetic acid. Incompatible with strong bases: ammonia, amines, cresols, isocyanates, alkylene oxides; epichlorohydrin, sulfites, resorcinol, salicylic acid, and chloral hydrate.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

301-04-2, diacetate

PAC-1: 5 milligram per cubic meter

PAC-2: 55 milligram per cubic meter

PAC-3: 330 milligram per cubic meter

6080-56-4, lead acetate(II), trihydrate

PAC-1: 14 milligram per cubic meter

PAC-2: 150 milligram per cubic meter

PAC-3: 920 milligram per cubic meter

1335-32-6, basic

PAC-1: 5.4 milligram per cubic meter

PAC-2: 59 milligram per cubic meter

PAC-3: 360 milligram per cubic meter

As Organic Lead:

ACGIH TLV[1]: No listing for organic lead compounds.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: This material is poisonous. It emits toxic fumes of lead when heated to decomposition. Symptoms of exposure include irritation on the eyes, respiratory tract, and alimentary tract; headache, nausea, vomiting, colic, constipation, leg cramps; muscle weakness; paralysis, paresthesias, depression, dizziness, loss of consciousness; coma, and death. High levels of exposure to lead acetate may affect the CNS and blood, causing anemia, nervous disorders; kidney impairment.

Long-Term Exposure: Repeated exposure may cause lead to accumulate in the body and may cause lead poisoning. See above for symptoms. May affect the blood, bone marrow; cardiovascular system; kidneys, nervous system including weakness and poor coordination in the arms and legs; hemolytic anemia; increase of blood pressure; paralysis, brain damage; behavioral effects including irritability, reduced memory; and disturbed sleep. Has been shown to cause kidney cancer in animals; possibly carcinogenic to humans. A probable teratogen. May cause reduced growth of offspring after birth while also decreasing fertility in males.

Points of Attack: Kidneys, brain, nervous system; blood.

Medical Surveillance: OSHA mandated medical tests: whole blood (chemical/metabolite), blood lead level, hemoglobin, hematocrit, zinc protoporphyrin, blood urea nitrogen, serum creatinine; urinalysis (routine), microscopic examination. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women $<$ 45 years old.

NIOSH lists the following tests: whole blood (chemical/metabolite); Blood Lead Level; biologic tissue/biopsy; CBC; Nerve Conduction Studies; Neurologic Examination/Electromyography; red blood cells/count; red blood cells/count: Zinc Protoporphyrin; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), 24-hour collection; Zinc Protoporphyrin; Zinc Protoporphyrin, after 1-month exposure.

First Aid: Skin Contact:[52] Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. Ingestion: Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Avoid dust inhalation; wear NIOSH and United States Bureau of Mines approved dust mask. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH 78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Lead (1910.1025 & 1926.62): $<$ or = 0.5 milligram per cubic meter (10 × PEL)

Half-mask* air-purifying respirator equipped with high-efficiency filters**. $<$ or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. $<$ or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. $<$ or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. $>$ 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool, dry place and keep tightly covered and avoid contact with oxidizers, strong acids; chemically active metals. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1616 Lead acetate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with water to avoid airborne dust then transfer material to vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead acetate may burn but does not easily ignite. Thermal decomposition products may include Acetic acid fumes and oxides of metal and carbon. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAes that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Convert to nitrate using nitric acid; evaporate, then saturate with H_2S; wash and dry the sulfide and ship to the supplier[22]. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazard Alert: Poison (cumulative), Possible risk of forming tumors, Reproductive toxin, Environmental hazard.

EPA ADI = (preschool children) less than the 3 mg[Pb]/week recommended provisionally for adults.

Banned or Severely Restricted (In Agriculture in India, Japan) (UN)[13]

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025 and 1910. 1018)

United States National Primary Drinking Water Regulations: MCLG = zero mg[Pb]/L; MCL = Action Level = 0.015 mg [Pb]/L. Lead is regulated by a TT that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps, as Lead; MCLG = zero mg[As]/L; MCL = 0.010 mg[As]/L as Arsenic.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992); 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number D008

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R23/25; R50/53; R62; safety phrases: S1/2; S20/21; S28; S29; S41; S45, S60, S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead arsenate is an odorless, heavy, white powder, or crystals. Molecular weight = 899.4; specific gravity (H_2O:1) = 5.8 @ 20°C; freezing/melting point = (decomposes) approximately 280°C. Also listed @ 1042°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in cold water; soluble in hot water.

Dibasic: Molecular weight = 347; Specific gravity (H_2O:1) = 5.94 @ 20°C.

Potential Exposure: Used as an insecticide, herbicide, and in manufacture of drugs; veterinary tapeworm medicine.

Incompatibilities: Violent reactions occur from contact with oxidizers, chemically active metals; strong acids. Acids and acid mists cause the release of arsine, a deadly gas. Decomposes above 270°C forming toxic fumes including arsenic and lead compounds.

Permissible Exposure Limits in Air

NIOSH IDLH = 5 mg[As]/m^3 See also IDLH for lead [Pb] below.*

As Arsenic:

OSHA PEL: 0.01 mg[As]/m^3 TWA; cancer hazard that can be inhaled, see 29CFR1910.1018

NIOSH REL: 0.002 mg[As]/m^3 [15 min.] Ceiling Concentration. Limit exposure to lowest feasible level. See NIOSH Pocket Guide, Appendix A

ACGIH TLV[1]: TLV[1] withdrawn.

DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/end-of-shift; Carcinogen Category; Germ Cell Mutagen Group 3A.

PAC Ver. 29[138]

3687-31-8

PAC-1: 9.1 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 600 milligram per cubic meter

7784-40-9, dibasic

PAC-1: 7 milligram per cubic meter

PAC-2: 77 milligram per cubic meter

PAC-3: 460 milligram per cubic meter

Arab Republic of Egypt: TWA 0.2 milligram per cubic meter, 1993; Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Belgium: TWA 0.2 milligram per cubic meter, 1993; Denmark: TWA 0.05 milligram per cubic meter, 1999; Finland: carcinogen, 1993; France: VME 0.2 milligram per cubic meter, 1993; Hungary: STEL 0.5 milligram per cubic meter, carcinogen, 1993; India: TWA 0.2 milligram per cubic meter, 1993; Norway: TWA 0.02 milligram per cubic meter, 1999; the Philippines: TWA 0.5 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.01 milligram per cubic meter, 1999; Sweden: NGV 0.03 milligram per cubic meter, carcinogen, 1999; Switzerland: TWA 0.1 milligram per cubic meter, carcinogen, 1999; Thailand: TWA 0.5 milligram per cubic meter, 1993; Turkey: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 0.1 milligram per cubic meter, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 milligram per cubic meter on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air:[60] 0.06 milligram per cubic meter (California Prop. 65), 0.0002 μ/m^3 (Rhode Island), 0.00023 μ/m^3 (North Carolina), 0.024 μ/m^3 (Pennsylvania), 0.05 μ/m^3 (Connecticut), 0.07–0.39 μ/m^3 (Montana), 0.67 μ/m^3 (New York), 1.0 μ/m^3 (South Carolina), 2.0 μ/m^3 (North Dakota), 3.3 μ/m^3 (Virginia), 5 μ/m^3 (Nevada).

As Lead:

*NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers “lead” to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead “soaps” but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood.

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age < 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

National primary and secondary ambient air quality standards for lead and its compounds, 1.5 μ[Pb]/m^3, maximum arithmetic mean averaged over a calendar quarter [40 CFR 50.12, Appendix G].

Argentina[35] has set 0.15 milligram per cubic meter as a TWA ambient air[60] ranging from 0.5 μ/m^3 (New York) to 0.75 μ/m^3 (South Carolina) to 0.5 μ/m^3 (Florida and North Dakota) to 2.5 μ/m^3 (Virginia) to 3.0 μ/m^3 (Connecticut) to 4.0 μ/m^3 (Nevada).

Permissible Concentration in Water: Arsenic: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L. Runoff from spills or fire control may cause water pollution. Lead: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: See OSHA Analytical Method ID-105 for arsenic. The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is ICP optical emission spectrometry. For lead, digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Lead arsenate irritates the eyes, skin, and respiratory tract. Skin contact can cause burning sensation; itching and rash. High exposure can cause poor appetite; nausea, vomiting, and muscle cramps. May affect the heart, with abnormal EKG, GI tract, and nervous system. Arsenic intoxication; nausea, diarrhea, inflammation of skin and mucous membranes; lead intoxication: abdominal pain; appetite loss; constipation; tiredness, weakness, nervousness; paresthesia. A rebuttable presumption against registration for pesticide uses was issued on October 18, 1978 by EPA on the basis of oncogenicity, teratogenicity, and mutagenicity.

Long-Term Exposure: Arsenic can cause skin damage or problems with circulatory systems, and may have increased risk of cancer. Lead can cause the following: Infants and children: Delays in physical or mental development; children could show slight deficits in attention span and learning abilities. Adults: Kidney problems; high blood pressure. Lead arsenate is a carcinogen and has been shown to cause skin, lung, and liver cancer. Lead arsenate may also affect the GI tract; nervous system; kidneys, and blood. Lead and certain lead compounds may be teratogens and cause reproductive damage in humans. See entry on lead for additional information on lead poisoning.

Points of Attack: Kidneys, blood, gingival tissue, lymphatic, skin, GI system; CNS.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you. Test for urine arsenic. Levels should not be greater than 100 micrograms per gram of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women $<$ 45 years old.

Also seek prompt medical evaluation if health effects are noticed. With each visit, careful attention should be given to the inner nose, skin, nails and nervous system. A test for serum arsenic is recommended. NIOSH recommends urine arsenic should not be greater than 50−100 μg/L of urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic and may be of SOME value in the case of lead poisoning. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Persons with significant lead poisoning can be treated with Ca EDTA while hospitalized. Since this drug causes a rush of lead from body organs into the blood and kidneys, and thus has its own hazards, it must be done by experienced medical persons under careful observation. It or other "chelating" drugs should never be used to prevent poisoning while exposure continues, as severe kidney damage can result.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Where risk assessment shows air-purifying respirators are appropriate, use a full-face respirator type (N100) United States or Type P3 (EN-143) respirators as backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU). Requirements for Respiratory Protection for Inorganic Arsenicals with Significant Vapor Pressure: < or = 100 μg/m^3 (1) Half-mask* air-purifying respirator equipped with high-efficiency filter** and acid gas cartridge; or (2) Any half-mask* supplied-air respirator. < or = 500 μg/m^3 (1) Front-or back-mounted gas mask equipped with high-efficiency filter** and acid gas canister; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. < or = 10,000 μg/m^3 Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 20,000 μg/m^3 Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. > 20,000 μg/m^3, unknown concentrations, or firefighting: Any full-facepiece SCBA operated in positive-pressure mode.

* Half-mask respirators shall not be used for protection against arsenic trichloride, as it is rapidly absorbed through the skin.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodisperesed particles of 0.3 μm in diameter or higher.

As Lead:

Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL)

Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead arsenate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Avoid the presence of acids since arsine, a very deadly gas, is released in the presence of acid or acid mist. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1617 Lead arsenates, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable. Thermal decomposition products may include metal oxides of lead and arsenic. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Protect against exposure to dust or fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Long- term storage in large, weatherproof, and sift-proof storage bins or silos; may be disposed of by conversion to soluble salt, such as chloride, precipitation as sulfide and return to supplier[22].

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R20/22; R23/25; R33; R50/53; R61; R62; safety phrases: S20/21; S28; R29; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead chloride is a white crystalline powder. Molecular weight = 278.1; specific gravity (H_2O:1) = 5.85 @ 20°C; boiling point = 950°C; freezing/melting point = 501°C; vapor pressure = 1 mmHg @ 547°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in cold water; more soluble in hot water.

Potential Exposure: Used to make lead salts; lead chromate pigments; as an analytical reagent for making other chemicals; making printed circuit boards; as a solder and flux.

Incompatibilities: A reducing agent. Violent reaction with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and chemically active metals. Explosive with calcium + warming.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.2 milligram per cubic meter

PAC-2: 160 milligram per cubic meter

PAC-3: 940 milligram per cubic meter

Lead:

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 $\mu g/m^3$ of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in $\mu g/m^3$) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers “lead” to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood.

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

The National primary and secondary ambient air quality standards for lead and its compounds (measured as elemental Pb) = 1 mg[Pb]/m^3, maximum arithmetic mean averaged over a calendar quarter. In addition, Russia[43] set a MAC in the ambient air of residential areas (on a daily average basis) of 0.0017 milligram per cubic meter (about six times the same limits for lead compounds in general).

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, skin. Can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short-Term Exposure: Lead chloride can irritate the eyes on contact. Inhalation can irritate the nose and throat. Skin contact can cause burning, itching, rash, and pigment changes. Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance; headache, aching bones and muscles; constipation, abdominal pains, and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death. *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long-Term Exposure: Lead chloride causes mutations. Such chemicals have a cancer risk. May damage the developing fetus. High levels can cause lead poisoning with symptoms of headache, irritability, disturbed sleep; tiredness, reduced memory, and personality changes. Higher levels can cause muscle or joint pains, weakness, and easy fatigue. Exposure can increase the risk of high blood pressure. May cause kidney and brain damage, and anemia. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a Blue line at the gum margin; decreased handgrip strength; abdominal pain; severe constipation; nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, and papaverine). Consider morphine sulfate for severe pain. Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio; urine ALA; and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as edetate disodium calcium (Ca EDTA) and penicillamine (*not penicillin*) have been found to be generally useful in the therapy of acute lead intoxication.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result. Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL)
Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.
* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.
** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.
